FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, JANUARY 29, 1885.

VOL. XXIV.—No. 1. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. Newsdealers in the United Kingdom may order through Davies & Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, London, Eng.

Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.

THE CARE OF THE NATIONAL PARK.

SENATOR VEST'S bill, relative to the Yellowstone National Park, is still in the hands of the House Committee on Territories. It will be remembered that this bill provides in its second section for an increase in the area of the reservation, as recommended by Mr. Arnold Hague in his letter to Senator Vest, published in FOREST AND STREAM of March 13, 1884. This second section is as follows:

Sec. 2. That all of the territory embraced within the limits of the Park as herein established shall be reserved and withdrawn from settlement, occupancy or sale under the laws of the United States, and dedicated and set apart as a public park or pleasure ground for the benefit and enjoyment of the people of the United States; and said territory so set apart shall be under the control of the Secretary of the Interior, and subject to all the provisions of sections numbered twenty-four hundred and seventy-four and twenty-four hundred and seventy-five of the Revised Statutes of the United States, except as herein otherwise provided.

There has been some prospect that local feeling between the Territories of Montana and Wyoming might endanger the passage of the bill, which provides, notwithstanding that the changed boundaries of the Park would bring it wholly within the Territory of Wyoming, that it should be subject to the laws and under the jurisdiction of Montana. The fact that there are some mines, though unimportant ones, near the northeast corner of the Park, still further complicates matters by furnishing to a few men a certain excuse for urging the building of a railway through a portion of the reservation. As a consequence of these disturbing features of the subject the delegates from Montana and Wyoming are understood to have been opposed to the bill as it passed the Senate.

The urgent need of the passage of some bill which shall provide for adequate measures of protection for the Park as well as for all the contingencies in regard to violations of law and rules which must constantly arise in a large reservation, practically without any government, is recognized by all who are interested in the National Park.

During the present short session of Congress it had been thought almost hopeless to attempt to press the bill to a vote, but the friends of the Park have been active in the matter, and the bill has been so modified that the principal opposition to it has been silenced. The changes which have been made in the original Vest bill will not be relished by those who have hoped to see this important subject treated in a broad, statesmanlike manner. They are unsatisfactory because they limit the usefulness of the bill, materially reducing the area proposed to be added to the reservation, and throwing open to settlement a portion of the territory originally set aside by the act of 1872.

The modifications of the Vest bill we understand to be substantially these. The jurisdiction of the Park is placed wholly under Wyoming Territory, and the northern boundary of the Park is so changed that it shall be the 45th parallel, from the 111th meridian east to the Yellowstone River, thence shall follow the north or east bank of that stream to the East Fork, thence up the north bank of the East Fork to the intersection of that stream with the meridian of 110° 10′, thence along a line running due east to the meridian of 109° 30′.

The change proposed leaves the mining district, of which Cook City is the center, wholly without the Park, and must cut away from beneath those interested in that region all ground for opposition to the bill. There are some advantages in making the river a boundary of the Park, since it is a natural barrier which all will recognize, and about which there never can be any mistake. If a highway should ever be required to the country east of the Park, it can follow the north bank of the Yellowstone and its East Fork, and will thus lie wholly without the Park. The propriety of placing the Park under the jurisdiction and laws of Wyoming is also apparent since, as has been said, the reservation lies within that Territory.

At the meeting of the House Committee on Territories in which this subject was considered, no other business was transacted, and it was agreed to make a unanimous report, and to urge upon the House the prompt passage of the bill as modified. Should the House consider the bill and pass it, it would go back to the Senate. It seems probable that in view of the difficulties and delay, if not the impossibility of passing the original bill, Senator Vest would accept the amendments and urge a vote on the bill by the Senate.

We have no hesitation in declaring that the amended bill promises so much less than we had hoped for, that it is a real disappointment. At the same time it is so great an improvement on the present law, or lack of law, that it should pass without delay. We have seen during the past few years the impossibility of properly looking after the Park, owing to the absence of any laws fixing the responsibility of its care on any one individual or set of individuals, and it is high time that there should be something in the shape of a government more definite than the loosely-framed acts and regulations, which have hitherto hindered rather than helped the efforts made for the protection of the natural wonders, the forests and the game of the reservation.

The possession by the Government of the Yellowstone Park, should be a matter of pride and exaltation to every citizen of the Union. No country in the world has so large a park, and nowhere are there so varied and magnificent natural wonders as are here to be seen. These wonders should be protected from destruction by selfish or careless visitors. Many of them are of such a character that if injured now, they will be destroyed forever, or at best can only be restored after a lapse of many years.

The forests of the Park protect the heads of two of the most important rivers of North America, one, the Snake, flowing into the Pacific, the other, the Yellowstone, finding its way into the Atlantic. These streams after leaving the mountains flow for long distances through arid regions which are only cultivable by means of irrigation, and should the forests about the heads of these rivers be cleared away, their volume would be so diminished that the farmers, who now and in the future will depend on them for their water supply, would be absolutely unable to raise crops. It is only by means of a law of Congress that these forests can be preserved from fire and from the axe of the lumberman.

The indigenous wild animals of Western America are surely worth preserving. It is becoming well known that the large game of the Rocky Mountains is disappearing at a rate which is so rapid as to pass the belief of those who have not closely watched the subject. The buffalo are all gone, that is to say those within the United States borders are to-day to be counted by hundreds, where ten years ago they could be numbered by hundreds of thousands. The elk, killed in enormous numbers for their hides, are passing away only less rapidly than did the buffalo, and the deer and antelope are following the same road. If moose and mountain sheep are not killed in similar great quantities, it is only because the accident of their haunts makes it a difficult matter to slaughter them by wholesale. It is worth our while to try to preserve this game. Call it a sentiment if you will—though it is more than that—still it is a subject which deeply interests a large and constantly increasing number of our American citizens, and one which should receive attention before it is too late to remedy the evil done by the wasteful, the selfish, and the unscrupulous. It is in the Yellowstone Park, if anywhere on this continent, that these different species must survive, and it is here that they should be conserved to be a benefit to science and the people, long after they shall have become extinct everywhere else throughout their former range.

Finally, the Yellowstone Park and the territory now proposed to be added to it is absolutely valueless to the settler, and therefore the passage of the bill in question can by no possibility work injustice to any citizen. Its altitude, averaging nearly 8,000 feet, makes it a region of cold. "Nine months winter and three months very late in the fall," about expresses the conditions of the climate. Frosts occur every month, almost every week, in the year. The agriculturist can never settle here, for crops will not grow. For the same reason it is forbidden ground to the stockman. The deep snows which for more than six months of the year cover the ground, render it impossible for range cattle to live here. There are no mines within the reservation, nor are any likely to be found. The only possible industry which could be carried on in the Park, even temporarily, is lumbering; but as we have pointed out, one of the strongest reasons for making laws for the Park, is to protect the forests and so the great streams which take their rise here.

Since then there are abundant reasons why the Park should be cared for and enlarged, and none at all against such a course, we urge most strenuously the passage of the Vest bill as we understand it to have been amended by the House Committee on Territories. Each season that the matter is delayed an amount of damage is done in the Park which can only be repaired by the expenditure of years of time and great sums of money. The careless camper fires the forest, the meat butcher kills the game, the tourist breaks down a ton of the beautiful and delicate geyser crater or hot spring rim to get a few pounds of "specimen." The appropriations are small, the guardians few in number, many of them appointed through political influence, and even if desirous of performing their duties, ignorant of their powers to arrest and bring to justice. All this should be changed, and a proper and efficient system of guardianship inaugurated. This will be done by the bill under consideration, which we hope to see become a law without delay.

This bill commends itself to all who are interested in the Park from purely unselfish motives. Its provisions are approved by Mr. Arnold Hague, of the U. S. Geological Survey, whose acquaintance with the Park is so extensive as to entitle his opinion to the greatest weight. It is most important that the bill should receive the unanimous vote of the House, and that before the close of the session it should have received the signature of the President.

ONE THING AT A TIME.—It is hoped that a non-hounding clause may be incorporated into the New York game law this winter. This can be accomplished only by persistent effort and, as experience has amply shown, by confining that effort to the single point to be gained. Will individuals and associations, who think that other changes in the law should be made, please stand aside this year and refrain from muddling the mind of the average legislator by a multiplicity of contradictory suggestions? By sticking to one thing the amendment may be carried. If a dozen different bills are presented, it is probable that just a dozen bills will be defeated.

THE BROOKLYN GUN CLUB is circulating a petition asking the Legislature to refuse the demands of the dealers for a longer open season. The list of signatures includes many well-known names, among them being those of Judge C. E. Pratt, James L. Hill, late District Attorney of Schenectady county, and F. H. Smith. The Brooklyn Gun Club is conspicuously active in sensible work. Its members have put out a number of quail on Long Island, and we presume that they are naturally somewhat incensed to think that the pot-hunters want more time to market those very birds.

MICHIGAN VENISON.—It should not be forgotten that much of the venison that the dealers complain cannot be sold comes from Michigan, whence it has been shipped in violation of the law. Michigan needs an organized State game warden system to provide for the seizure of the contraband goods and the punishment of those engaged in the illicit traffic.

THE ADIRONDACK FORESTS.

THE Forestry Commission appointed last year to report on the best measures for the preservation of the Adirondack forests, has done its work and submitted a report to the Legislature. This report is no less conspicuous for its tact and conciliatory spirit than for the amount of solid information it contains and the practical nature of its suggestions. There is a very strong feeling that State ownership of the forests is essential to strict conservancy and economic administration, and this feeling is well grounded on the experience of European countries; but it has been seen, in the first place, that the proposal that the State should acquire the whole Adirondack forest area by law of eminent domain was met by such determined opposition on the part of private owners, that to have persisted in it would have been to have lost all by aiming at too much; and, in the second place, it is very questionable whether the State would have been benefitted by the immediate possession of more land than it is in a position to place under systematic conservancy. The State holds already more than three-quarters of a million acres of land in the Adirondack wilderness, the bulk of which is already not merely denuded of its forests, but has been subjected to so many fires that very little of it is in a condition to restock itself; and the proper restoration of this area will tax all the State's resources for some years to come.

The Commission, well advised in this matter, has not only discounted all opposition from private owners in anticipation, by recommending that the State should not seek to acquire any lands in the wilderness save such as may be surrendered voluntarily and at low price; but has ably aimed at securing the cordial co-operation of the whole body of private land owners by recommending that their lands be placed on an equal footing with the State lands in every respect, even in the matter of taxation, and that owners be given more protection from trespass and its attendant fires than now exists under the law.

These preliminary recommendations are well calculated not merely to avert opposition, but to secure the cordial co-operation of all those whose determined hostility to previous legislation was sufficient to destroy its practical usefulness. An especially popular measure among land owners in the wilderness, is that embodied in the recommendation that State lands be placed on an equality with private lands in the matter of taxation. Hitherto State lands have been held free from taxation, they have contributed nothing to local assessments, and in those townships in which State lands constitute a considerable proportion of the area, the whole burden of taxation falls on the private holdings. This system, so manifestly unfair in its operation, is the cause of the bitter jealousy with which private land owners regard the acquisition by the State of lands in the same township with them. The Legislature can hardly fail to give effect to this recommendation, and by doing so will transform the most determined opponents of all forest legislation for the Adirondacks into friendly critics of any bill having the preservation of the forest character of the region for its object.

It is now generally well understood that forests are not to be maintained in good order by excluding the axe, but that the great economic aim of forest administration is to raise the productive yield of the forests to the highest capacity of the soil. If private owners do not operate their own forests to advantage the loss is theirs. The Commissioners recommend no restriction on timber operations, satisfied that mismanaged lands will sooner or later fall into the hands of the State by voluntary surrender.

The destruction resulting from fires, and the necessity of determined legislation for their suppression, is strongly emphasized; the preservation and restoration of the denuded area of the State forests is earnestly recommended, and for this purpose a forest commission with abundant power is deemed essential. A series of bills has been prepared and submitted to the Legislature, and there is reasonable hope that the committees appointed to consider their provisions, will embody the best features of each in a bill which will be acceptable to the members of both Houses, and to the people at large.

Senator Low is already before the House with a little bill of his own, he evidently thinks highly of the labors of the Commission, for he proposes to appoint another honorary commission for three years with a wide range of duties. He would have done better to have submitted his bill to be boiled down with the series submitted by the Commission. There is no more work for honorary commissions to perform; the question of the desirability of State conservancy of its own forests and wastes, has been investigated carefully, and answered affirmatively and decidedly. There remains now nothing but to organize a forest department, with power and means to give effect to the recommendations. We want a paid commissioner with a competent staff of deputies, and if care be taken in their selection, they may safely be left to the responsibility of the duties imposed on them.

Senator Low's provision for the formation of professorships and classes of forestry at Cornell University is a good one. Forestry is a profession requiring special training, and it is desirable that the future forest staff of this country should be native born and its efficiency secured by home training. Men of liberal education and special training are wanted for the junior as well as for the senior grades. No greater mistake can be made than to organize the forest department as a one-horse machine. A more or less able commissioner, with a staff of ill-paid incompetents to give effect to his instructions, will surely result in failure and disappointment.

A practical knowledge of forestry is in the highest degree desirable in a chief commissioner, but a deficiency on this head may be compensated for by administrative ability—for his deputies, who have to give practical effect to their instructions in the field, professional experience is essential.

NON-RESIDENTS IN NEW JERSEY.

THERE are in New Jersey two game societies, which claim the right to levy a tax on non-resident sportsmen. One of these, the West Jersey Game Protective Society, organized in 1873, claims this right only in respect to six counties; and holds that no non-resident can go shooting in those counties without a certificate of membership granted by its officers. The New Jersey Game and Fish Protective Society, formed in 1878 contends that its jurisdiction extends over the entire State, and that non-residents equipped with its license are at liberty to seek their game wherever it is to be found, even in the six counties over which the other society holds sway.

Some time ago a man named Welsh, who bore a certificate from the New Jersey Society, was arrested for gunning in Salem county without a certificate from the West Jersey Society. The former organization professed a desire to make a test case at that time, but owing to some defect in the legal rigmarole the thing fell through. Another case of similar character is now dragging its slow length through the New Jersey courts. Last October, C. B. Jones, of Philadelphia, a member of the New Jersey Society, was arrested in Burlington by officers of the West Jersey Society, and on the charge of gunning without the license from the latter, was fined $50. The New Jersey Society's counsel immediately filed appeal bonds, and the matter came before Judge Reed, in the Cumberland county courts, at Bridgeton, recently. That official last week rendered his decision that under the charter of the West Jersey, that society had jurisdiction over the territory covered by the six counties of Camden, Gloucester, Salem, Cumberland, Cape May and Atlantic. The New Jersey Game and Fish Protective Society have carried the case to the Supreme Court, where it will shortly be argued.

The extraordinary nature of this New Jersey non-resident legislation has been adverted to in our columns. It is a great pity that, instead of a dispute between two rival societies to see which has the right to exact tribute from the visiting sportsman, this case is not one to test the constitutionality of the whole proceeding. The object of the societies is unquestionably a good one; but the means taken to secure that object we believe to be most questionable.

It is possibly true that an individual, arrested by the officers of either society on the ground that he had no license from them, could, if he brought suit for illegal arrest, win his case and demonstrate that, under existing New Jersey statutes, neither one society nor the other had any authority to molest him so long as he were not violating such provisions of the game law as apply to residents and non-residents alike. The point involved is not of the constitutionality of non-resident game laws. One consideration is whether these societies actually possess, by any twist of the text of the present law, the authority to levy taxes on non-residents; and another consideration is whether, if the statutes do delegate this authority, they be not unconstitutional and absurd.

RIFLE DEFINITIONS.

THE question of rifle definitions outlined in the letter of James Duane in our rifle columns, is an interesting one. Again and again there are misunderstandings at the ranges, and long wrangles over the question of what is a military rifle, and again of what is a sporting weapon. The line between these two classes of arms is a constantly wavering one, and within the ten years of modern rifle shooting in this country has been almost completely swept away. The tendency has been to make the definition of a military rifle broader and broader, and bring that class of weapon nearer and nearer the any-rifle class. This simply shows that the attempt to make it appear on paper that a military rifle should be something rougher and coarser than other arms of accuracy is a false one, and that no set of rules may be so drawn as to give a fixed and clear distinction between the two groups of arms.

The trouble has been in the past that there has been a rivalry between the military men and the civilians in a shooting way. One class insisted upon having a weapon which could be employed as a spade handle, as a pick and pry for all kinds of rough work, and incidentally a shooting weapon. This was the military arm of the past. The civilian shooting rifle was a complicated affair with many useless details, upon which great stress was laid by the owners, but which were removed when their true worthless character was made known. The two sets of arms were then separated by a wide gap.

It was comparatively an easy thing then to make definitions and distinguish one class from another; but gradually the two sets of arms drew together. The military magnates were compelled to acknowledge that they were far behind the age of outside science in the sort of arms that were kept in the hands of soldiers. It was discovered that it was not profitable to give men the very poorest machines possible with which to defend their lives. The demand was for better rifles and for a better class of men to use them. From the other direction came the civilian arm, trimmed of much of its nonsensical features, and then when a number of changes had been made on either side it was found that a really satisfactory military arm—such a one, too, as properly trained soldiers could use—was nothing more than a sporting target rifle, and that the rifle chosen by men in an any-rifle match was really, in its essential feature of barrel, ammunition and sights, just such a rifle as could with safety be put in the hands of a soldier of the present day.

The old names exist while the old differences have been swept away. The limit of weight is after all the most important item in making up a rule for modern rifle practice, a military service rifle must be one which can be carried by an ordinary man. In its manipulation he must be educated up, rather than have the arm simplified down to a point where its use as a weapon of accuracy is largely impaired. A very light trigger pull might safely be allowed in military arms, provided it is surrounded by proper guards, as in certain recent improved models. Other changes will suggest themselves which might safely be introduced into military arms, but they will come gradually, and any definition of this class of arms must be a very elastic one, if it is not to become antiquated in a very short space of time.

VENISON FED TO DOGS.—Some (a great many) men are dog poor. They have more dogs than they can feed. Some (a great many) communities are dog poor. They have more dogs than they can feed. But the dogs must eat. Sometimes they eat mutton. In the Adirondacks in winter they eat venison. The packs of hounds which are kept for deer driving in summer, are set loose to drive deer in winter for their own consumption. Can the State of New York afford to furnish venison for the support of hounds?

ADIRONDACK DEER HOUNDING.—The hounding of deer in the Adirondacks ought to be forbidden by law. This is the conclusion arrived at by those who have seen how the so-called sport is conducted. We have a printed petition blank which will be sent to those who will secure signatures to it; and every individual who is interested in the subject is earnestly invited to give the movement his practical aid. The blank will be sent on receipt of an addressed envelope.

INDIVIDUAL EFFORT.—The intention of the game dealers to extend the season for the sale of game has been fully ventilated in this journal. Why? So that every individual in the State who has any concern in the matter (and every citizen ought to have) may be prompted to exert his own individual influence to thwart the schemes of the pot-hunters and snarers. A word to your representative at Albany will go far to win the battle.

MINNESOTA VENISON.—It should not be forgotten that a great deal of the venison that the New York dealers complain cannot be sold is received from Minnesota. It is shipped from that State in violation of law. Minnesota needs an organized State game warden system to provide for the seizure of contraband goods and the punishment of the shippers.

PIE PHILOSOPHY.—The American Association for the Protection of Pie and Pie Eaters, finding that the pastry supply is diminishing, has unanimously resolved to remedy the evil by increasing the allowance of pie for each member. By making away with two pieces, where only one piece was eaten before, the society hopes to save the pie.

THE CHICAGO GAME MARKET is reported to be the port to which great quantities of Minnesota venison are shipped. The meat is sent in locked chests, one key being had by the shipper and the other by the consignee. Like other forms of contraband goods traffic, the illicit venison business is sharply managed.

NEEDED JUST NOW—An association with membership embracing every county in the State, an association to defend the game law against the attacks of selfish and greedy combinations. In default of such a society it is the duty of individuals to do each his share.

ADIRONDACK VENISON.—It should not be forgotten that a part of the venison that the dealers complain cannot be sold comes from the Adirondacks, where it has been killed by hounding and crusting in the close season.

A PEG.—If any one fails to understand the axiom that an open season for selling venison means an open season for killing deer, let him read the first paragraph in the first communication on deer hounding, page 8.

OPPOSED TO DEER HOUNDING.—The Adirondack guides would gladly see deer hounding abolished. They will see to it that if such a law is passed the dogs will be kept out.

THE WHITNEY ARMORY, at New Haven, was partially destroyed by fire last week. The loss is said to have been $75,000.

A BIG DIFFERENCE—Between killing deer to hounds on a runway and killing deer to hounds from a boat in a lake.

THROUGH TWO-OCEAN PASS.

I.—INTO THE FIREHOLE BASIN.

ONE can enter the Yellowstone Park from the north or from the west. By way of the Northern Pacific Railroad you are brought by steam to within seven miles of the Mammoth Hot Springs on Gardiner's River, while the main points of interest, the Geyser Basins, the Lake, the Falls and the Cañon are still a long stage drive distant. From the railroad station of the Utah Northern Railroad, at Beaver Cañon, it is about ninety miles into the Firehole Basin, and when that is reached the most delightful and interesting scenery of the Park is easily accessible.

Ten years ago I entered the Park from the north, last summer from the west. A friend, whose name is familiar to workers in science in America, in Europe and in the farthest East, had asked me to join him for a few weeks' trip through the marvelous region of the Park, and I had gladly accepted his kind invitation.

In the simple narrative of the trip which will be comprised in these letters, there will be found no description of those wonderful features of the Park which lie on the route of the ordinary traveler. These wonders and beauties have already an extensive literature of their own, to which the reader who is interested in the subject can readily turn. To this literature nothing of value could be added from the hasty notes made during a very hurried trip, whose main plan and purpose was an examination of a tract of country proposed, by a bill now before Congress, to be added to the present reservation. This examination was made in part, though the early setting in of winter in the mountains prevented its completion. Enough was seen, however, to make it quite clear that a wide stretch of country to the south of the Park should be added to it. The reasons for this are that—

First—It is a country in which rise the heads of two very important rivers, the Yellowstone, flowing into the Atlantic, and the Snake, flowing into the Pacific Ocean.

Second—It is a country of grand natural scenery, which should be retained by the Government for the free and perpetual use of all its citizens.

Third—It is a country valueless to the settler, *i. e.*, to the agriculturist, to the stock raiser, and to the miner, its sole economic product being its timber, which should be protected from the axe under the severest penalties.

Fourth—It is a country abounding in game, from which, if efficiently preserved, all the territory adjacent to the Park may perpetually be stocked with the wild animals peculiar to the Rocky Mountains.

The observations upon which these conclusions are based will be set forth more or less fully in the succeeding narrative.

Five days of railroad travel had brought me to Beaver Cañon, whence the stage was to take me into the Firehole Basin, where I expected to find the camp. There we would cut loose from civilized methods of travel, and pony and pack mule would thereafter furnish us transportation.

It was a lovely morning when I stepped into the stage at Beaver. The air had a crisp, autumnal sharpness, though the August sun, which was just showing its face over the eastern hills, would soon melt the rime from the willows along the stream, and pour down upon the plain with fervid power. The loungers of the town had not yet begun to collect about the saloon doors, but the tame bears chained to their posts had already taken up their monotonous march backward and forward over the narrow space worn bare by their weary, patient tread. From the underbrush in the stream bottom could be heard the voices of many mountain birds, and the surface of the pools, where the hurrying rivulet paused now and then, as if to take breath, was often dimpled by the splash of the rising trout.

From the town the road leads southward down the cañon about four miles, and then having reached the plain, turns eastward and follows the foothills toward the Continental Divide. The hills on the left are rounded and for the most part smooth. Here and there grow pines, with pretty meadowy openings among them. Down on the plain the land, viewed from the farmer's standpoint, looks well. If irrigated it would no doubt bear crops, and there is no dearth of water, for many little streams flow out from the mountains. On Camas Creek, about fifteen miles from Beaver Cañon, there are wide, level meadows, over which it would be an easy matter to bring water, and from which heavy crops of hay might be cut. Oats and barley, with potatoes, turnips, and other root crops could undoubtedly be grown here, and in time will be. To all appearances the country is admirably adapted for stock, but there seems to be none here, a fact which is explained by the statement that the winters are very severe, the snow falling heavily and lying so deep on the ground, that even horses have to be taken up and fed hay. It is said that here neither the soft, warm Chinook breezes of Northern Montana and Idaho, nor the biting, incessant winds of Central Wyoming, carry off the snow, but that it falls heavy and quiet all through the winter, and remains on the ground until spring. Neither will the country do for a summer range, for the stock would have to be driven so far in spring and fall, that it would not be worth while to move them in and out. All the principal streams between the Beaver and Henry's Fork of Snake River—Camas, Divide, Sheridan and Shotgun—have a good volume of water, and would seem to invite settlement. The country along Shotgun especially is for a long distance a natural hay meadow several miles in width, on which the grass grows thick and rank, but there seem to be as yet no settlements. Far across the valley of this stream a few antelope were seen, but they were wild and permitted no near approach. Geese and ducks are very abundant here. They are thought to breed in the mountain lakes, and when the broods are old enough to fly they collect on these streams, where food is abundant and the banks so low that they can see a long distance, and so are not easily approached. Trout are numerous in all these waters, and are very gamy on the hook, and delicious eating. Three gentlemen fishing in the Shotgun the last of August, took one afternoon two hundred fish from a single hole. They reported them enormously abundant wherever they fished for them, and spoke in the highest terms of the sport which they afforded. The same party had excellent goose shooting on this stream.

A short distance above the mouth of the Shotgun, the stage road crosses Henry's Fork, which is a large clear stream perhaps fifty yards in width and from three to four feet deep. Its volume remains about the same winter and summer, and the melting of the snows in spring causes but little rise in the water. The river abounds in trout and whitefish of excellent quality. Some idea of their number may be formed from the fact that near the station a man in one night speared 600 fish late in August. Such fishing as this cannot fail, if long kept up, to lessen the supply, but at present it only takes place at one or two points, for there are but few settlements on the river.

After crossing the stream near the mouth of the Shotgun, the road leads through the green pine timber, and across open grassy parks at no great distance from the river, which it crosses again about six miles further on. Two miles beyond the second crossing is the stage station, consisting of two or three comfortable cabins and as many tents. The station is admirably kept, the beds clean and the table well supplied. It is in striking contrast to many similar stopping places in the West.

The claim belongs to the Rea brothers, who have built cabins, stables, a blacksmith shop and other buildings, and have a few head of horses and cows. An enormous quantity of hay might be cut here, for on both sides of the stream the land is a rich, black, moist soil, which nourishes a heavy growth of grass. The winters are so severe—that is the snow lies so deep—that all stock must be taken up in the fall and fed. The elder Rea has been in the country seventeen years and may therefore be supposed to know it fairly well. He stated in a conversation I had with him that game is still quite plenty here. There are a few moose; elk and deer are rather abundant, as are also bears, the black and cinnamon being common, while the grizzly is not often seen. Mountain sheep are very scarce. In reply to special inquiries as to white goats and caribou, he stated that he had never known of either being found in the neighborhood or in the vicinity of the Park. The nearest points where goats are to be found is, he said, between Bitterroot and the Bighole, a long distance to the westward. The Reas make a business of taking out hunting parties, and had but just come in from a twenty-eight days' trip with three Englishmen. In this time, the party got four moose, one black bear, and enough elk and deer to keep the camp supplied with meat. They also captured a black bear cub.

Of the abundance and excellence of the trout Rea spoke very enthusiastically. He said that at present they only run up to three and one-half or four pounds in weight, but that formerly it was not unusual to catch them much larger, and that the heaviest one he ever caught weighed six and one-half pounds. Rea stated that he intended next winter to build a good hotel here, and he hopes that in a few years the place will become quite a resort for travelers. Certainly the spot is a beautiful one. The houses stand close to the water's edge in the green timber. Across the river is a wide meadow, and beyond this the dense forest. The cool clear waters are broken almost constantly by the rise of the trout, and in the distance, over the treetops, can be seen the summit of the mountains, rough with bold rock faces and pinnacles, with here and there a deep ravine or a steep mountain slope on which still (in August) lies a drift of the snow of the past winter.

From Henry's Fork to Marshall's, in the lower Geyser Basin, is forty-five miles, a long drive when it is remembered that a part of the distance is over a steep mountain by a very bad and hard road. From the station to the Pass over the Continental Divide the road crosses the level bottom of the river, but it is wet and in many places quite soft, so that it is impossible to drive fast. A few antelope were seen at a great distance in this bottom, but they were wild and took to flight almost as soon as the stage came in view. Geese, ducks and sandhill cranes were enormously abundant here, and could be seen everywhere, either feeding on the prairie or swimming in the pools and sloughs. Every few hundred yards, as it seemed, we would approach some bare spot where a great flock of geese would be standing motionless, intently watching our approach, and when we were within a hundred yards or so, the oldest birds, with a premonitory honk or two, would prepare to rise, and then the whole clamorous flock would take to wing and circle about until, as they gradually drew further away, the trumpet-like music of their voices would fall on the ear more and more faintly, and at length be lost in the distance.

Just before reaching the low hills to the north of this meadow, Henry's Lake comes into view. It is a beautiful sheet of water, with gently sloping grassy shores, from which, here and there, a wooded point juts out into the lake. The mountains stand far back from the lake, and the scene, though beautiful and picturesque, has about it little that is grand or imposing. To the westward the Red Rock Mountains rise boldly, thickly timbered on their lower slopes, and then breaking off sharply into the abrupt precipices and landslides, from the color of which the range takes its name. On the east is the main range. The Continental Divide is here very low, but little more than 7,000 feet in height at the Pass, and the mountains, though topped by precipices of bare rock, are not especially bold nor striking.

The road takes us through the Tyhee Pass. The name on the maps and in the guide books is variously spelled Tyhgee, Tighee or Taghee, and I heard a gentleman explain it as the name of an old Bannock chieftain who used to live down toward Fort Hall, and bring his tribe up each year through this Pass on their autumn hunt. The explanation was no doubt satisfactory to most of those who heard it, but, though given in good faith, it was pure fiction. The word *tyhee* in the so-called Chinook jargon, means chief, and this pass is the Chief Pass, and is called by this name quite as often as by the name Tyhee Pass. There is, to be sure, somewhat more of poetry in the thought of the old Bannock chieftain leading his dusky warriors up over the gentle ascent of this pass to the lovely Basin of the Madison beyond, but, as a matter of fact, the Tyhee Pass was not named after any one in particular. It is the chief, or principal, pass. Just before turning into the Pass a creek is crossed on which General Howard, at the time of the Nez Percés outbreak, had a fight with that tribe.

The ascent to the Pass is a moderate one, and for half a mile near the summit the road is quite level. The last water flowing into the Pacific is a beautiful clear spring, which trickles out of the hillside to the left of the road, and is at once lost in the green meadow below. The Atlantic water is a larger stream near its source, and before long is dammed by the beavers, and spreads out into pretty ponds.

The Madison Basin, into which we now descend, is a beautiful bit of country—an extensive park—watered by clear streams, with abundant grass and fine timber. The stage stopped for noon at the South Fork of the Madison, a remarkably beautiful stream. Its waters, which are of unusual transparency and brilliancy, abound in trout and grayling of large size. I heard of the capture of one of the latter, on a fly-rod, which weighed two and three-quarter pounds. There are no settlements in the Basin, though one ranch was passed where a couple of men were putting up hay, and one or two abandoned cabins were seen. The stage station consists merely of a rough stable for the horses and a tent for the station keeper. There are few more beautiful locations than this; but here, as so often through this country, the heavy snowfall has prevented settlement.

After leaving South Fork, the road for about fifteen miles winds about through the timber on the level flood plain of the river, and is as good as could be asked for. Though there are some limited areas which have been burned over, most of the trees are green. Little parks are passed here and there, and sometimes the road runs along the bench close above the broad river. The ascent of the mountain range which separates the Madison from the Firehole Basin, is the only really bad piece of road between Beaver and the end of the stage route. It is appropriately called the Big Hill, and the road is laid out as badly as possible. It would be difficult anywhere to find a worse piece of engineering. Instead of winding about and taking advantage of the easier slopes, it runs straight up the sides of some of the steepest hogbacks. A road is much better if long with a gradual ascent, than short and steep, and by increasing somewhat the absolute length of the ascent of this hill, it could have been made much easier; but no attempt is made to spare the horses and the pull is terribly severe.

The mountain is volcanic, the lava being a black rhyolitic rock, almost an obsidian. In many places one can see where the sedimentary rock and soil have been calcined by the molten lava which has been extruded through it. The rhyolite often breaks down readily on exposure to the weather, and the ground is covered in many places with its jet black fragments, which, shining and glossy, at a little distance resemble so much finely-broken anthracite coal.

The summit of the mountain reached, we pass a girdled pine tree, which marks the western border of the Yellowstone National Park. From here for several miles the road is through an undulating timbered country, and then we come to the crest of the hill and see beneath us the columns of steam and the white tracts of geyserite, which mark the Basin of the Firehole.

It is well named. Looking down from the mountain top it might be imagined that in the broad valley at our feet were burning a thousand fires. From some of them rise great white clouds, as from a mighty conflagration; others give forth a tiny gray, curling vapor, like that which might come from the dying embers of a deserted camp-fire. The scene in the valley below is one of life and activity. Horses and cattle are browsing on the flat. Mounted men dash hither and thither on their nimble steeds. Two or three stages move briskly along the roads. Heavy wagons laden with trunks, provisions and bedding stand by tents, about which move numbers of people. Men are chopping wood, building fires, or hobbling and picketing out their horses. There are houses—one, two, three, a dozen. It is the

old spot, but how changed by the lapse of a few years. When I last looked upon it, it was as silent and unten anted as if never trodden by the foot of man, and now it is a settlement!

As we paused to lock the wheels preparatory to making the descent, I mused upon the change. And yet the bustling activity of the scene was no surprise. Here at our feet in this valley was going on just what is now taking place all over the West, only it was a little more concentrated. If from some lofty station in the sky one could obtain a bird's eye view of the vast area between the Missouri River and the Pacific Ocean he would see, but on a vastly grander scale, and spread out over a territory measured by miles where this contains inches, just such scenes as were taking place before me here. I was looking down upon a mimic West. From the British line south to the Mexican boundary, and from the great river west to the ocean, wherever there is wood, water and grass, there the settler, earnest, industrious and much enduring, has pressed in and erected his little cabin, has broken up his bit of prairie, planted his crop, turned out his few head of stock, and made for himself a home in the wilderness.

The descent of the very steep hill was soon made, and a few minutes later, after crossing the Firehole River, we drew up before Marshall's hotel. As the stage turned toward the building, the first thing I saw and the pleasantest, was the countenance of my friend Mr. Hague, who welcomed me cordially to the Basin. His camp was about three-quarters of a mile northwest of the hotel, and a pack mule with two or three horses standing tied to a tree near at hand gave me to understand that we were to move to his camp at once. A beautiful little pinto horse, white with pale roan spots, was pointed out to me as my mount. He was a well built little beast, and I congratulated myself on having so good an animal, although his roached mane and his general aspect led me to think that he was a horse with a decided will of his own, and that in case of any important difference of opinion between himself and his rider, he might reply to all arguments by bucking so vigorously that there would be no opportunity for reply.

A few moments' brisk gallop brought us to the camp, which was charmingly placed among a grove of pines at the foot of a little volcanic cone, just back from the river. Before it was a broad meadow full of hot springs, one of which furnished a convenient lavatory. Its warmth was grateful, for the air was chill. I here met the other members of the party, whose ready courtesy made me at once feel at home and like a regularly installed member of the party. After dinner it was pleasant to sit about the campfire and gather from their conversation something of the life and methods of thought of those who were to be my companions for the next few weeks. Most of the gentlemen were men of long experience in the West, and none of them had spent less than two seasons in the field. There was, therefore, much that was instructive in what I heard, and it was late when the party broke up and retired to their blankets.

[TO BE CONTINUED.]

The Sportsman Tourist.

CAMP FLOTSAM.

XII.—"A SPELL O' WEATHER."

WHEN we awoke we had drifted well into the morning. The sound of the steadily falling rain admonished us that we were better off in bed than out of doors; so we turned on the bunk and tried to sleep on. In drowsy indolence we listened to the patter on the roof and journeyed back through the years, until our semi-slumber was mingled with that of boyhood's healthy breathings, lying on the newly cut clover mowed high away under the rafters of the barn on the farm, and listening to the same music; back to roguish, boyish days, when, stretched on the garret floor of the old farm house, half fearful of the great chimneys, we pored over Crusoe and Aladdin, with the same patter, patter, drip, drip, sounding in our ears. Alas for him who is never thus summoned to meet his youth, to whom there never comes from that far off play-ground the olden yearnings and enthusiasms, though it be but to gaze on fallen idols and to read through tears the inscriptions on gray old stones, overgrown with the mosses of thirty years.

When we arose the soggy canvas was heavily swaying overhead, and everything without was in a swish and swirl of water. The site of the camp-fire was an island in the midst of a sea, on the nether shore of which, under the table, our chickens were gathered in a forlorn and bedraggled state, apparently apprehensive of the pot pie to which a continuance of the storm would consign one or more.

In a few minutes the pipe of the camp stove was projecting from the lee end of the tent; that useful appendage was in place, and upon it the coffee was boiling and the potatoes and bacon frying. Breakfast was had in the tent, and that over, out came the rubber coats and blankets, rods were jointed, the boat bailed out, and we set out to see what sport might be had on the lake. The fog was drifting along the barren hillsides, the water was whirling and beating itself into foam on the rocks, and the cold rain was driving on us as we put off from shore. Turning to the northward, we rounded the lower end of the island, passed over an open sheet of water for half a mile, and worked our way between two small islands into a little bay, where we found shelter under the lee of one of the larger islands. Here, just off a rocky point, we cast anchor and baited up. It was one of our favorite days, so far as the weather went, and the place looked fishy. With the low, rocky headland overgrown with stunted shrubs, it seemed the counterpart of another fishing place on a mountain lake, on the shore of which, with a young Cuban for a companion, we had one summer builded our camp. On a morning like this we had pulled two miles up the lake to try the fishing off the point, so like the one before us. As we approached the place we saw a solitary figure sitting upon a rock at the very edge of the water, with his arms crossed upon his knees and his forehead resting upon his arms, heedless of the rain which was pouring upon him. As we came to anchor, some twenty feet away, the figure raised its head, took one quick glance at us, and dropped into its first position. It was a young mountaineer, about fifteen or sixteen years of age, with bushy, unkempt hair, a freckled face and buttermilk eyes. But what was he doing here alone and in the storm? Not fishing certainly; perhaps he had been injured or was sick, so we inquired.

"What's the matter, my boy?"

He did not raise his head, and the answer came in a smothered sort of way from the region of the diaphragm, a muffled, subdued—

"Nawthin."

"What are you doing here?"

"Nawthin."

"Is this a good fishing place?"

"Naw."

"Did you ever fish here?"

"Naw."

During the cross-examination we had cast out, and at this point it was interrupted by the leap and splash of a bass which had taken Juan's frog and was making things quite lively for that individual, who was sitting in the stern. For the first time the native appeared to take an interest in our proceedings. Roused by the splash, he sat upright, and watched Juan as he played the fish, now at the bow, and again at the very foot of the rock on which he was sitting. The fish gave another leap, shook the hook from its mouth, and was gone. It was the turn of the native to ask questions, and he began with:

"What d'yer dror 'm thru the water that way fur?"

Juan turned and fiercely asked: "Who is doing this?"

The native rested his chin on his hand, and made this comment:

"Yer can't ketch 'm that way."

Juan's dark face glowed with anger, but he was silent. In another minute we were each playing a bass, both of which were landed. Two more were taken in, when the mountaineer began to show signs of excitement. He rose to his feet and looked wildly about. Just then there was another strike, and his stoicism gave way, and he disappeared in the bushes. In a second he reappeared with a hickory pole, and again seating himself, without a word, began fishing. In a moment he flung a fine bass over his head into the bushes. Then from the water behind a rock he drew a long twig, upon which were strung a dozen others, to which he added the one just caught. There was a war dance in that boat for a few minutes. Juan yelled in choice Spanish, ending with something that sounded like "carrajo," and threw what movable property there was in the boat at the head of the silent angler. The rogue was fishing when we approached the point, and fearing lest we might be attracted to his preserves, had hidden his tackle and fish. That boy had in him all the elements that go to make up a sportsman. With a little experience, he would have made a capital guide.

Whatever the place might resemble, we were soon satisfied that in the way of sport it was doomed to be a failure, so after half an hour we moved out of the bay and halted under the shelter of another island to try deeper water. Here better success attended us, and after three hours, which time was marked with many a goodly fight, we found ourselves, in spite of frequent bailing, with wet feet and altogether damp and chilly. Our thoughts turned toward the shelter and comfort of the camp. It was a dreary and cheerless pull homeward, with the rain driving into every exposed place about us, and we crawled out at the landing thoroughly numbed. Within the tent all was dry and warm. The fire in the little camp stove was not yet out, and with some dry wood added, was soon rolling out a grateful heat. The long morning out had sharpened our appetites, but the coffee, boiled fish, potatoes and hot shortcake, cooked and baked on the camp stove, quickly made us satisfied with the world.

Whatever of trouble there may be in carrying a camp stove, a single day like the one we are describing, passed in comfort, repays one a thousand times. Here let us describe ours. It is a plain sheet-iron box, two feet long, and one foot wide and high. A hearth and legs are inserted under strips of the same material, which are riveted on the bottom. A hinged door, through which a circular hole is cut for a draft, is in one end. On the top near the back end is the hole for the stovepipe, with a rim over which the same fits. The latter consists of an upright length, an elbow and three horizontal lengths. These are made with a taper so as to slide one within another, and, except the elbow, all are carried in the single upright length. This, with the elbow, goes in the stove, which will hold besides the hearth, legs, coffee pot, and all the tinware required in camp with room for extras. A heavy wire across the door end which, when not in use, falls under the hearth, serves as a bail by which it can be carried. The arrangement is light, can be shipped in a barrel with blankets or other camp goods, and can be set up in two minutes. A forked stick set in the ground outside the tent door supports the pipe when the stove is in use. While it is not intended for cooking, but to render the tent comfortable in cold or stormy weather, yet a meal can be easily cooked upon it if desirable in bad weather. When not in use it is set outside the tent. With such an arrangement a camp is perfect, and clothing, provisions and blankets are insured against dampness. A small wooden box, from which the bottom has been removed, can be slipped over the pipe, and about this the tent flops can be closely drawn without danger to them from the heat, and the tent will thus be rendered as close as a house. This is often desirable on a rainy night, when a few knots will keep the tent warm without its becoming uncomfortably so. The above is the only kind of camp stove which can be carried without soiling everything with soot. Of course it will not do for a canoeist, but for a camp it is the best we have seen. The patent stove, from which the top lifts to allow the fire to be replenished, fills the tent with smoke every time it is opened, and is a poor contrivance.

It is astonishing with what little preparation some people will try the experiment of camping. We once came upon a party which was undergoing the tribulations attendant a cold northeast storm. They had abandoned their light and leaky tent, and were gathered against a rock where they were nursing a sputtering fire and regaling themselves on the remnants of their last night's supper. As may be supposed, they were unanimous in the resolve to never camp again. It was not their first experience in camp, but was luckily the first storm which they had encountered. We have seen parties go out season after season with about the same preparation they would make for a summer day's picnic, and get back without having encountered more than a shower. At last they try it once too often, and from that time their camping days are at an end. However, these are usually of the "all day piddely, piddely" sort, and are better off at home.

We sat the rest of the day by the cheerful fire, extracting no little pleasure from the last FOREST AND STREAM. Night came on dark and dismal. The thermometer on a tree in front of the tent marked 54° F. The rain was steadily falling when we turned in, and we fell asleep with the sound of the same patter, patter, in our ears which had greeted us that morning.

When the light again came through the tent the old rattle was still sounding on the roof. After breakfast we tried the fishing in the places of the day before, but without success, and we came in damp and chilled. The day was spent in writing and gossip. Steadily the rain drifted through the trees and over the tent as daylight faded and darkness came on once more. Another morning the counterpart of the preceding came with the same drizzle and drip.

The forenoon brought us a visitor, a little, short, stumpy, grizzled old fellow, with a squint in one eye and a leer upon his face, which when he spoke made one query whether he was in earnest or only bent on guying the camp. He was made welcome, and after seating himself and taking a liberal bite of plug, during which operation he squinted about the tent, he observed that "yous have run foul of a spell o' weather," a proposition to which all assented. "It's bad hay wether," he went on; "they wus hevin a moin' bee up on Ike Dowels's flat, just afore the rain set in, an' I heerd yisterday that it's all under; seed any ducks?" Some one had seen five that morning. "It's quite a place fur 'em," he resumed, "an' used ter be for pigeons a little back of here. One mornin', less see, it mus' be nigh on ter five and twenty year ago, I hed a critter stray off an' I started to look 'er up. I wus a goin' long the age of Dowel's medder wen I seed a flock of pigeons skirtin' long the woods; pigeons wus plenty in them days, an' I didn't watch 'em as I would now. Bimeby long cum another flock an' another arter 'em, rite over hed, an' then I begun to wish I'd brought my gun along. Wile I wus thinkin' wat a shot it wus long cum lot more rite clus by, an' I wus most reddy to swear cause I lef the gun to hum. Then they begun to cum from all directions, acres an' acres of 'em till overhed was black with 'em, an' I jes' swore, I did, boys, cause I was sich a dum fool as to cum off without the gun. So I set down under a big dead tree to look at 'em. Wal, they kep a comin' an' a comin', millyuns an' millyuns uv 'em, an' at las the biggest flock I ever did see lit in the tree I was a settin' under; they made it black clear out to the ends of the lims. Gosh a mitey, I never seed the like afore. I jess pulled up an' blazed rite thru 'em 'thout takin' aim." The native rose in apparent excitement, his chest heaved and his nostrils expanded; the ardor of the sportsman was evidently upon him. "Grate Jehosafax, how they cum down thru the lims. I picked up mor'n—" "How did ye kill 'em, boss?" broke in the factotum. "I wus loaded with No. 6 shot," calmly pursued the old man with a squint at his interrogator, "an' not to be interruptin' ye—" "But," exploded his questioner, "ye been tellin' us all long ye left yer gun to hum."

"Did I? No I didn't, neither; an' wat if I did, consarn yer, that wus another time I wus tellin' about. I kin prove wat I say by old Ike's boy."

"Well, how many did yer kill?"

"It don't make no difference how many I kilt, as I knows on, if yous ain't willin' to take a man's word fur nuthin', an' are goin' to ketch 'm up that way," and he strode off in a state of indignation.

Unwilling that our visitor should feel that the laws of hospitality had been violated, we followed and interviewed him under the table fly. A generous dose of pain killer from the Madame's medicine chest and a cigar restored him, and the old leer upon his face asserted itself more distinctly than ever. "You's on quite an island for porkypines, seed any? No! Well, they won't hurt yer; but they're bad on a dog wat tackles 'm. Why, they'll cum right inter yer tents, they're so tame, an' they're good eatin', too. Las' summer I wus out 'n the bush with a lot of us fur a week or so, an' one mornin' the dogs had one treed right by the shanty. Wal' sur, the boys shot at that porkypine all the forenoon, an' couldn't fetch 'm outer that tree, an' at las' I got tired of the noise, an' knocked 'm outer the tree with a club, an' kilt an' skinned 'm an' cooked 'm in the wash tub, I did sur, be gob."

To the evident disappointment of the old man, we waived a cross-examination; his sidelong squint was too inviting, and we soon saw him to his boat and off. When he was out of earshot, the factotum soliloquized: "'f he wan't so cussed ugly, I'd liked to ask 'm how they cum to have a wash tub in camp, an' I wonder how they could cook in one, anyhow." Perhaps no one will ever find out.

Swish came the rain at intervals through the afternoon and until bed time, and after that as we turned on our bunks, we could hear the sharp rattle going on, and we began to wonder how long it was going to last.

The next morning a patch of sunlight was dancing on the roof, the leaves were rustling in the fresh breeze, our mimic lake before the tent had disappeared, and the cloudless sky above told us that we were through with the "spell o' weather."

WAWAYANDA.

COLUMBIA COUNTY GUN AND ROD CLUB.—The Gun and Rod Club of Columbia county, N. Y., recently elected these officers: President, Jonathan Bixby, Hudson; Vice-President, Philip H. Sheldon, Hudson; Secretary, William H. Hart, Hudson; Treasurer, Luther Shute, Greenport; Directors, Henry DuBois, Livingston; Grosvenor B. Rossman, Ancram; Henry Feroe, Hudson. Attorneys, Henry Miller, Hudson; Charles M. Bell, Hillsdale; C. F. T. Beale, Hudson. Legislative Committee, Dr. Wm. H. Hart, Hudson; Stephen W. Ham, Hudson; Milton Shaurman, Gallatin; Peter S. Pulver, Claverack; William Dinehart, Copake; Peter Brusie, Hudson. The secretary was directed to cause the new laws to be printed and posted throughout the county, and to report to the club any violations that might be presented to him. The annual meeting will be held Feb. 5.

WOODDUCK FEATHERS.—*Editor Forest and Stream:* Can you or any of your readers inform me as to where I can obtain some of the barred and spotted feathers from the sides of the woodduck? I should like to get them at once, and will be much obliged to any one who will give me the information at the address below.—F. SATTERTHWAITE (2 West Park street, Newark, N. J.). [John Wallace, 16 North William street, may be able to put you on the track of what you want.]

Natural History.

SNAPPING TURTLES.

IT is not easy to learn much about the *Chelydra serpentina*. Nor are there many who care to know particularly about his habits. If he will only leave our young ducks and goslings alone and make no inroads upon our fish ponds we are satisfied.

But so far as the writer has observed, the difficulty of studying the habits of the snapping turtle in his native haunts comes from the fact that not only is he naturally shy, but also that his life is spent so much beneath the surface of the water. So much more we might say than the life of most reptiles, and particularly his congener, the painted turtle, that is so fond of sunning himself on all the old logs.

It is not so with *Chelydra serpentina*. This kind of enjoyment in the open air is opposed to his nature, and we think for one of the best of reasons. The locality where we have studied the ways of this turtle the most was on a large marsh bordering Lake Ontario in Jefferson county, N. Y., near the place where life saving station No. 1 now stands. Here this turtle abounds. He usually makes his appearance about the middle of May, sometimes earlier, sometimes later; much depends upon the season. The first one caught last spring was on the 10th of May. The earliest indication that we have of his "being around," is to find him in the fyke nets. These nets are set in the ponds and creeks of the marsh, and the moment that *C. serpentina* is astir he seeks to establish himself in the funnel of one of them. And, of course, when he is there neither perch, bullhead, nor pickerel are allowed to find their way into the cod or purse. The most we have ever heard the fisherman say of him, however, was that "he would not let the fish go in." This seems to be their opinion. But we think there is a reason for his establishing himself here. His idea is to fill his hungry maw after the winter's fast. And he seeks to do this, like creatures of more reason, at the least expense of crawling or labor. But certain it is, there is no chance of fish finding their way to the cod while he stands guard at the entrance.

About the first of June, the females crawl out of the marsh to deposit their eggs. They are not so particular about where they make their deposit, as they are to find a warm and dry place, where there is a soft loam or sand that does not retain moisture long. To find such a locality they will make quite long journeys. Last spring my friend Mr. F. M. Noble, who has always been more or less a student of nature, found an immense one in his garden looking for such a place.

This turtle must have crawled over three hundred yards from the water and up hill at that, though we have known them to make much longer journeys. One was found a few years since in this vicinity that must have traveled nearly half a mile to find a sand hill. It is the nearness and dryness of the beach upon which Life Saving Station No. 1 stands that makes it such a favorite resort for turtles.

When they make their appearance, the backs of the older ones are covered with patches of algæ. On some of them these patches are quite large and the algæ quite long. Hence they are called "mossbacks" by the people living in the neighborhood. As you see some of them climbing up the banks or coming down, you might suppose that a piece of old log or a boulder had taken to itself legs and gone on a pilgrimage.

Their walk is ungainly in the extreme. The head is lifted, the tail drags, the legs are raised seemingly to keep the body as far as possible from the sand. When they are on these walking tours and a stick is pointed at them they at once seize it in their powerful jaws and allow themselves to be dragged over the sand for a considerable distance before they will let go. We have known this characteristic of the snapper to afford the boys living in the neighborhood of their haunts considerable amusement. The fun was to see whose turtle would hold on the longest. If turned upon his back it is with much difficulty and after many efforts that the snapper can recover himself.

But apart from the natural shyness of the snapping turtle, we have always thought that the algæ on their backs was one reason why they were so seldom seen. Not only as it helps to conceal them in the marsh, but as they cannot expose themselves to the direct rays of the sun, on logs or land like other turtles. And again, as we find them so careful as a general thing in the time they select for laying their eggs, on cloudy days or immediately after a shower, or at night. Though there is another reason why they should come out of the marsh in such numbers immediately after a shower. The sand is then wet and will not cave in as they dig, and it can be packed. For the sand along this beach is remarkably fine, and blows and drifts at the least provocation.

So far as our observation goes (and it is hard to observe here, for this turtle is shy in every way), the hole is dug with the hind foot, which serves as a kind of scoop, making the excavation somewhat purse-shaped. The reason, we suppose, that any have ever thought that this hole was made with the tail is because the tail is bent down, perhaps to serve as a prop to the hinder parts, while the fore feet are raised to their highest stretch, although the tail may be used in the hard sand in some way, so as to let the foot into the excavation. It is not impossible that its hard extremity may perforate the sand so as to loosen it, and thus give the hind foot a better chance to sink its claws in and scoop out the hole. But of this we know little from actual observation. We were speaking of the algæ on the backs of the snapper, and the time they select for laying their eggs. There is no doubt that the algæ, as we have said, helps to conceal them, and gives us a reason why they are not more frequently seen in places where they abound. If they were to come out on logs or land on a sunny day, the sun would dry up these marks of antiquity on their backs and thus render their shells uncomfortable.

But so it is, that if we see one of these turtles at all after the laying season is over, it is usually floating on the surface, the feet moving occasionally to keep it up, with just its nose (beaks the fishermen call them) out of water or on the bottom in a shallow pond, or mounted on a bunch of water grass or lily-pads, which its weight sinks just below the surface, and never on old logs. At least, we have never seen the snapping turtle in this position.

Nor have we ever seen these algæ growing on the backs of snappers that lived in mud bogs or along the banks of sluggish streams or in ponds that did not abound more or less with water plants. However, others have, and consequently those that we have met may have only reached the age that produces this growth.

Of course they smell badly. Nor does this come altogether from the algæ. Though perhaps the more algæ the more offensive. On the same principle do boys say, "The older the Billy goat the stronger the smell." However, in proportion to their size, perhaps, they do not smell so badly as the little marsh or mud turtle, and it has algæ on its back, too, if we remember.

The snapper is quite careful in concealing the place where she deposits her eggs. It is hard to find this spot. Not simply because she paws or flattens the sand over the place, but because she has the reputation of digging several holes before her eggs are laid. However this may be, it sometimes requires the nose of a mink or a skunk to find the right spot. From twenty to thirty eggs are usually laid; may be more than thirty. Much depends no doubt upon the age and size of the turtle. So far as we have learned they are all laid in one place and at one time, in a kind of purse-shaped hole five or six inches deep, or as deep as the turtle can sink her foot; though may be in different parts of our country these habits may vary, as birds and animals are accustomed to accommodate themselves to their peculiar surroundings. But thus it is we think with the snapper on this beach. So that when the turtle returns to the marsh she does not come out of it again until the next summer; and those who have seen the lily-pads flop up as though they had been pulled at from below, and had a mere glimpse of something like a sod disappearing beneath the weeds, have seen the most that we see of the snapper, unless she be caught on a hook or in a net after the laying season is over.

The young are hatched out in August and September. They are occasionally seen quite late in September. May be they were from the first eggs laid, and consequently at the bottom of the excavation, and hence the last to find their way to the surface; or may be they had been covered deeply with drifted sand, which we think was most likely.

We have not considered it necessary to say to the readers of FOREST AND STREAM that these eggs from which the young snappers come are about the size of a pigeon's egg, only perfectly round and with quite a shell on them—so much so that the egg can be blown and still retain its spherical form. Of course it is the heat of the sun that hatches them out.

The moment the young are hatched they at once make their way to the marsh. It is singular to notice how invariably they do this; hardly ever turning toward the lake, though it is quite as near to them as the flags and wild rice. We do not remember in all our rambles of ever having seen more than two or three turtles on the shore of the lake or tossed up by its waters.

When they are first hatched they are about the size of an English penny, with a head and a tail that at once indicate their species. We have never seen any but old ones and those very young.

The food of the *C. serpentina* is no doubt mostly animal when they can secure it, though roots and grasses must compose a part of their menu. We know they will receive a vegetable diet from that careful student of nature, Dr. A. K. Fisher. The doctor told the writer that, besides finding fish, frogs and the remains of animal organisms in their maws, he has also found skunk cabbage and once elderberries. His elderberry story is one of those singular incidents that naturalists occasionally meet with in their rambles.

The doctor was hunting on the edge of a bog. The bog at this time nearly dry. So much so, that there was only a little water in its wettest place. As he was on the lookout for whatever might show itself, he saw the branch of an elderberry bush pulled down and shaken. This led him to wonder and then to examine. He approached very carefully, when to his astonishment what should he see but the ugly head of a snapping turtle reached up to peck the overhanging bunches. In this we think the doctor is alone among naturalists. He has seen a snapping turtle picking berries, and that off of a bush. But animal food, as the doctor says, is no doubt the favorite food of the snapper. So we have always found it; be it flesh, fish or reptile. Nothing we conceive that flies, or runs, or creeps, or swims, or leaps, or crawls, goes amiss to him. It is all one to the snapper, though perhaps he has a preference for young wild ducks as a regular diet. But the worm upon the bait hook, or the minnow upon the set line, or a fat water beetle, or the larva of the corydalis, or dragon fly, or a fat bullfrog, or a water snake, or a mud puppy, or a lizard, or a young muskrat, or even a little one of its own kind that may happen to come within reach of his jaws, it is all the same, we think, and they are relished more or less alike.

In a former article to FOREST AND STREAM, we were led to speak of the injury that the snapper did to young wild ducks. We had seen them destroy a coot, and had the testimony of several farmers in respect to their losses in young mallards and goslings.

Now we have the witness of a friend in respect to their fondness for the finny tribe, apart from Dr. Fisher's discoveries. The friend was out fishing one day when, as he passed along the edge of the brook, what should he happen to spy but a snapping turtle concealed in their usual way, under the side of the bank, and partly covered by floating grasses and weeds. Here was a chance for a little fun. He could put a small fish on his line and just let it float down by the snapping turtle's nose. He did so, and the instant it came within reach of his neck the snapper secured it. This is their habit in brooks, to conceal themselves under the sides of the bank or among the weeds, and make a strike for everything that may come near them.

On the first signs of frost the *C. serpentina* disappears. He either buries himself in the mud or sinks himself down among the flags and rushes. A singular incident illustrating this habit occurred last spring on the very marsh of which we have been speaking.

An acquaintance of the writer was spearing muskrats on this marsh, when, as he made his way among the dead flags and rushes, he came across a small "feeding house." Thinking that possibly there might be a rat on the inside, he thrust his spear in, down through the roofing and into the bog below, until he thought he felt a rat's teeth grating on the spear head. He must pull it out now. But here was the difficulty. There was something on it. And it was heavy. What could it be? Had he two rats? He must raise it carefully. He did so. And what should he find when the spear came to light but an immense snapper. The muskrats had built their house directly over the place where the turtle had buried himself, and in thrusting the spear down it had gone through the house until it lodged in the turtle's shell. A. H. G.

PINE GROSBEAKS IN CAPTIVITY.—Lancaster, N. H., Jan. 14.—Pine grosbeaks are very common here this winter. They come because food is scarce in the northern regions. They make a very nice cage bird. They become very tame in a few days, and will take their food from the hand in three or four days.—S. J. G.

THE BIRDS OF MICHIGAN.

BY DR. MORRIS GIBBS.

(Continued.)

2. *Hylocichla fuscescens* (Steph.) Brd.—Wilson's thrush, tawny thrush, veery.

This agreeable songster reaches Kalamazoo county from May 1 to 10, being one of the last of the family to make its appearance. In Montcalm county it arrives considerably later, the earliest date during several years being May 9, while one season it did not appear till the 17th. It is generally distributed, and is known to occur in nearly every part of both the Upper and Lower Peninsula, and though not so common as the last species, is still well known, but is rarely seen by those not conversant with its habits because of its retiring nature.

It is a bird much oftener heard than seen, and so carefully does it generally keep concealed that few strollers observe it. The question is frequently asked "What song is that?" by persons who have heard the pleasing notes for years, but have never seen the singer. One might hear the veery for many seasons yet not get sight of the wary fellow if a thorough search was not instituted in the brush and brambles.

The song is a curious mixture of harmoniously blended notes. One writer compares it to the sound of an iron rod being rapidly drawn through an iron pipe, and this comparison, though apparently inconsistent, is not inappropriate, for, though its notes are beautifully blended, there is a peculiar metallic ring about the song readily observed by the ear educated to detect bird songs.

The sections in which the tawny thrush is generally found are low, damp woods, though the males are often observed perched on trees or high ground, but its usual haunts, in my experience, are the outskirts of woods surrounding pools of stagnant water over which, from May to September, hover myriads of mosquitoes.

This thrush was not known to Sager, 1839, and has been omitted from several lists since published, but is now known to nearly all collectors in Michigan.

At Idlewilde, a small summer resort in Wexford county, the veerys were found in great numbers, and the pleasing but monotonous songs could be heard on every side. In some localities the species is very common, again, whole sections may be hunted in vain for them.

The nest of the Wilson's thrush is, so far as my knowledge goes, placed upon the ground or just above it, among small supporting twigs and shoots, and is composed of mud, leaves, grass and twigs. The eggs are laid about the 25th of May or later. A nest that came under my notice in a dismal, swampy locality in Ottawa county on June 4, 1878, contained young several days old. This season was an unusually early one, however. In such a location the young are raised, and I have found half-grown fledglings in a nest so soggy that it could be stirred as easily as mortar, a result of the damp surroundings and recent rains.

Four eggs are usually laid, averaging a little smaller than those of the wood thrush, and about the same shade of blue, yet easily distinguishable by an oölogist.

With the completion of the nesting duties the singing usually ceases, though a few songs are often heard in August, but in a lower key. About the middle of September the most of the birds depart for the south, a few remaining a fortnight later.

3. *Hylocichla aliciæ* Baird—Gray-cheeked thrush.

Dr. Atkins of Locke has met with this specimen, and Mr. F. H. Chapin of Kalamazoo has observed the graycheek. It is probably not so rare as is generally supposed, but is seldom identified by collectors, as it is so frequently confounded with the following species. It may be reasonable to assume that this thrush is quite generally distributed within our boundaries, although probably in limited numbers. Of its habits nothing has as yet been determined by us.

4. *Hylocichla ustulata swainsoni* (Caban.) Ridg.—Olive-backed thrush, Swainson's thrush.

This is one of our rarer thrushes, and its habits are but little known, even to the close observer. The information as regards arrivals and departures during migrations is meager, for the species never appears in any numbers, and many collectors pass an entire season in the woods without seeing a specimen. It is a silent, retiring bird, and though a straggler occasionally enters the city and remains some time in private dooryards, it is as a rule scarcely seen. Arriving from the south in the early part of May the olive-back leisurely passes northward, but few remaining south of the 44th parallel. While migrating its presence is rarely detected, except by chance or the closest search by the collector. Although well distributed throughout the larger part of the Lower Peninsula, it is only locally dispersed even in those localities where it remains to breed.

Cabot, in his list of birds of Lake Superior and vicinity, and J. H. Steere, in his list of the birds of Sault Ste. Marie, omit this species. It is, however, undoubtedly found in the northern parts of the State during the nesting season, and most certainly as a migrant.

The nests are, so far as observations extend in the State, placed in bushes a few feet from the ground. It has been my good fortune to secure one set of eggs. The nest was placed in a bush about four feet from the ground, and was composed entirely of twigs, fibrous roots, bark and weed strippings. The structure is much more artistic in workmanship than the nests built by any others of the genus. Less bulky than that of the familiar catbird, it is somewhat similar in respect to material, and yet looks entirely different, not being so compact, but far neater in appearance.

Three eggs, comprising a set taken in Kalamazoo county, are faintly marked with obscure brown blotches, principally at the larger end; but in four eggs from Wexford county, the entire surface is more or less thickly spotted with umber. In ground color, the eggs more nearly resemble those of the catbird than any other species, but are not of so dark a shade of green. The Swainson's thrush is the only one of the genus which lays spotted eggs.

In the fall migrations, the birds are found in the southern counties as late as Oct. 1, and a few stragglers occasionally even later. This thrush is undoubtedly the most eccentric in its geographical range of any in its family famed for migrating. We learn that the olive-back is known to winter in Venezuela, while its northern haunts extend (probably) nearly to the Arctic circle.

5. *Hylocichla unalascæ pallasi* (Cab.), Ridgw.—Hermit thrush, rufus-tailed thrush.

Next to the robin this is the first species to arrive in the spring, and it occasionally appears as early as the last week in March, although the hermits are rarely seen in any numbers till the middle of April. The species appear to migrate with great deliberation, and specimens can often be found

loitering in the southern counties as late as May 10. It is a common occurrance to observe numbers about the dooryards in villages, and even in sequestered favored locations in large cities during the latter part of April and early May. These silent wayfarers often make a neighborhood their temporary home for a week or more. Such protracted stays occur both in spring and fall, the autumnal migrants usually remaining with us for several weeks, the severe weather of November often finding the hardy fellows frequenting hedgerows and thickets at the edges of woods.

Though silent while migrating, with the exception of the call note occasionally uttered, the birds break into full song on reaching the breeding haunts, and from May 15 to July 20 the woods are filled with the sweetly modulated notes of these charming singers. The ceremony of mating is usually accomplished with expedition, and soon after, the birds are at their nest-building. As yet I have not heard of a nest being found south of 43° north latitude, and it is reasonable to suppose that the species very rarely, if ever, remain as a summer resident in our southern counties. It is only in the middle and northern portions of the State that the hermit is found plentiful, where in pine lands its beautiful song can he heard almost constantly.

The nest of this species is more difficult to find than that of any other member of the family. Placed on the ground, always in a retired situation, concealed by small bushes, weeds and grass, its location can only be discovered by the accidental flushing of the old bird as you walk near the little home where she patiently sets, or by watching the parents as they bring material for the nest. The latter method would be next to impossible, for the birds are unusually shy and very difficult to study. A nest found by Mr. W. A. Gunn, May 20, 1879, was entirely concealed by a fallen withered pine branch. A nest which came under my notice June 10, 1882, in Montcalm county, was placed beneath a small bush, and the rim of the structure was even with the surface of the ground.

The eggs in every instance were three in number, and are of a beautiful blue color, much resembling in form and color those of the tawny thrush, but a little smaller. The nest is generally composed of grass, fibrous roots, fine twigs and some moss. Those that I have met with are not strongly put together.

This beautiful singer is one of our most common birds north of 44°, where, though not known by the settler, it trills sweet music among the stately pines and gaily passes the pleasant summer months among nature's wildest surroundings.

MOCKING BIRDS POISONING YOUNG.—Oswego, N. Y.—*Editor Forest and Stream:* While in Louisiana we found mocking birds quite numerous, and yet one rarely sees these birds in confinement in these States. We were informed that the reason why these sweet singers were not more frequently caged was on account of the difficulty of keeping the birds alive. It was claimed that birds which are at liberty, seeing one of their mates in confinement, will bring to its cage a poisonous berry which the imprisoned bird is sure to eat, and from the effects of which it invariably dies.—DOCTOR.

Game Bag and Gun.

"I inclose you a sketch. These incidents now in the time when hunting is past and a long year of hard labor resumed, sandwich themselves in; and I write them down to look at when I get old."

SOME REMARKABLE SHOTS.

Editor Forest and Stream:

Your many accounts of remarkable shots reminds me of a shot I once made while in practice at Lake Megantic, P. Q.

I was reading one evening on the front veranda of my house, which was about 100 feet from the lake shore, and a loon was making hideous music 300 yards out on the lake. I laid down my paper, stepped into the surgery, and took up a government regulation rifle, a converted Enfield, and taking a few cartridges, thought I would utilize the loon as a target. I raised the sight to 300 yards and fired. The ball fell short of the loon, which immediately disappeared, but came up a little further away. I raised the sights to 400 yards and fired again, this time splashing the water beyond the bird. I waited till he came to the surface and fired again. To my surprise the loon "turned its toes to the daisies." I got into my boat and rowed out to it, and upon examination I found the ball had entered the right eye and made its exit out of the left. The bullet was just the size of the eye, and the conjunctive of the right eye was not injured in the least, that of the left being slightly lacerated. I sent the loon to the taxidermist and had it set up. It weighed twelve pounds, and is a beautiful specimen. It stands now on the mantle in my office, and as a matter of course, every one thinks I am telling a whopper when I say: "I shot that bird through the eyes with a Snider rifle at a distance of 400 yards.

I claim no superiority of marksmanship. It was one of those chance shots that happen once or twice in a lifetime. I have fired hundreds of shots at loons and at closer ranges, and never wounded one (with this exception), which is, I think, the experience of a great many sportsmen. I once though got near enough to a loon on Lake Nicolet to shoot it with duck shot. I thought the bird acted a little "looney," and upon investigating found it had a hook in its mouth, and following up the line found a night line attached over 1,000 feet long, which a habitant had baited with minnow. I not only had the pleasure of confiscating and destroying the line, but found four or five "speckled beauties" on it, the smallest of which was a four-pounder. H. B.

BOSTON.

Editor Forest and Stream:

To call the incident I am about to put on record a "remarkable shot" seems a misnomer; it is rather the remarkable effect of an ordinary shot. Mr. A. P. H., of Cape May, who is known all over the country as one one of the most accomplished and genial, as well as one of the most popular of hotel men, fills up a good share of the enforced abundant leisure of his calling in the winter with duck shooting, at which he is an expert. About two weeks ago he was out in a cabined yacht in the sounds near Cape May with two friends for a week's shooting. One evening about sunset he took his sneakbox and went alone to a sandbar where the tide was slowly rising and put out his decoys. At dusk one black duck came in, which he shot and put in his boat. Shortly afterward three black ducks came in, one alighting among the decoys, and the other two stopping about seventy-five yards below. These last swam up to the other duck, and when the three were in range he fired, killing two, the other climbing up into the darkness, H. snapping a defective cartridge ineffectually after him. As he was rising to retrieve the dead birds, and was half way out of his boat, he heard a thud in the narrow hold of the sneakbox, and a struggle. Supposing it to be a return of vitality to the duck he had first shot, he caught the struggling bird and wrung its neck, and then went out and brought in his two dead birds from the sandbar. Placing them in the boat, he rowed back to the yacht, and when he took out his birds found that he had four black ducks, the one whose neck was wrung having been pierced by but a single shot which had penetrated the brain. F. S. J. C.

BRIDGETON, N. J., Jan. 20, 1885.

Editor Forest and Stream:

I had been wild turkey hunting, and in some unaccountable way made some strange misses at game. My wife desired me to shoot one of her domestic turkeys for dinner the next day; and as she had slyly touched upon my failure to bring home a wild turkey, I got off about forty yards from the gobbler she desired killed, as I was determined to show her that I could shoot. My gun was loaded with No. 8 shot. Just in the rear of the turkey was a dense box bush. I fired, and the turkey dropped dead, and a commotion under the box bush led to the discovery that I had killed three of my wife's hens and wounded several others, which had congregated under the box bush. GOOCHLAND COUNTY, Va.

BATTERY SHOOTING.

Editor Forest and Stream:

I have just read your editorial in your issue of Jan. 1 entitled "Battery Shooting," and it is so completely at variance with my experience and observation, gained by some thirty-five years' enthusiastic pursuit of wildfowl, that I feel tempted to reply to you, first premising that I know nothing about how battery shooting affects the fowls in the Great South Bay, or other waters of Long Island, but confining my remarks entirely to the waters of the Chesapeake, I begin with the head of the bay. There is no doubt that there is too much shooting there, not alone of box-shooting, but the ducks are harassed in every way. I think the remedy there would be to lessen the number of days in the month for shooting, confining the shooters to two, or even one day in the week, or another plan would be to confine the number of boxes licensed to a much smaller number, and allow no others on the grounds. This latter plan might seem unfair, as not giving all an equal chance, but it is no more unfair that the efforts of point and bar shooters to decry the battery, so that they can control the shooting. What were the facts some years ago when box-shooting on the "flats" was stopped by the oyster police force of the State in a great measure? It was found by the gentlemen shooting on the Bush, Gunpowder and other rivers, that the ducks congregated on the flats in immense beds, and being undisturbed, did not come into the adjacent rivers in any great numbers.

Now take the Elk and Bohemia rivers, at the head of the bay; it has only been within a few years that sinkboats were allowed to be used in those rivers, and this privilege was accorded the sportsmen of Cecil county because they found they could do little or nothing with the ducks from the shore. The ducks frequented the rivers named in large numbers, but they would not decoy from the shore or fly over the points, so the sportsmen were obliged to try some other way of getting at them; hence the sinkboats. Ducks, like all other things, have advanced with the times, and as a rule will not approach the shores as they did years ago, and other methods have to be adopted by the sportsman. The facts in regard to the waters of this county and the adjacent counties of Queen Anne and Dorchester are the same. Some twenty years ago some point-shooters on the Choptonk conceived themselves to be annoyed by the few boxes in the county (I think there were only three or four at the outside), and had a law passed to prevent box-shooting. The ducks, notwithstanding those "destructive" boxes, had been driven from our waters, continued to diminish in quantity, and to get still more wary about approaching the shores, until shooting almost came to an end. Then we had several seasons when food was abundant in our waters (and the want of which was the real cause in diminishing of the number of fowl in the previous years), and the ducks and geese commenced to increase, and have continued to do so up to the present winter; but notwithstanding that the fowl were in all our wide waters they afforded no shooting, as they would not decoy from the shore or fly over the points, so the sportsmen interested had the law repealed and allowed the bona fide residents of the county to use sinkboats, and although there are now some dozen or fifteen sinkboats used here they have not driven the ducks out, and will not as long as we have plenty of feed.

That the sinkboat is more detrimental to shooting than the same amount of shooting from the shore, I deny in toto; all that can be urged against their use is that they afford additional shooting points, and to that extent tend to frighten the fowl, as every shot fired at them does, as I don't think a duck cares whether the gun that frightens him is fired from a point, a booby blind, a sailboat, or a sinkbox. In proof of this, if proof were wanting, let me relate two circumstances that took place last winter. While on one of my shooting trips I found an immense bed of redheads using in one of our smaller rivers. I put my box out in the bay where they were feeding, but before I had had a dozen shots it came on to blow so hard the box would not live, so we were obliged to take up. One or two of the party then went ashore and commenced shooting from the point, the wind blowing so hard that it set the ducks on the point close enough to make some shooting; they continued to shoot there all the afternoon. The next day being favorable, I got my box out before daylight, and expected to have had a splendid day's sport. But only one small bunch came into the river that day. The point above spoken of, and the "narrows" near by, are two of the very few places in this county where we occasionally have that kind of shooting. Now for the other case that happened in the same locality. I found another large "bed" of redheads in the same small bay, and put out my box; this was about 1 o'clock in the afternoon. I only had one shot, as the ducks did not return; about half past three I commenced to take up my box. It fell calm just as I had everything picked up, so I had to anchor in the bay. The ducks commenced to pour in about 4 o'clock, and continued to do so until long after dark. Two gentlemen (sons of the owner of the "narrows" on which the ducks passed) saw the flight, and came down and shot as fast as they could load and shoot, until long after dark. The next morning I expected to have had fine shooting, but not a duck came in from outside. Now, what was the cause of the ducks not coming back on these two occasions? Was it my dozen or so shots in the first instance and my one shot in the second case that frightened them, or the incessant hammering they had on the narrows and from the point. I think in the last case it was the shooting from the narrows that did it, and in the former case, if it was not the shooting from the point, I think the ducks had consumed most of the feed in the small bay and were ready to seek new feeding grounds. I think this last reason caused many of the changes of locality we find in the large beds of ducks we have, as it takes an immense amount of food for some ten or fifteen thousand ducks. This change is often unjustly attributed to the box-shooter.

You object to the box "being anchored on the feeding grounds of the fowl," but so is the booby blind, and the latter put there permanently; whereas where the box was anchored to-day you will often find a bed of ducks feeding on the next day, or as soon as the box is removed. I know the sportsmen that shoot from the shore decry the sinkboat, "in season and out of season," but in their case it is purely on selfish grounds. If they could break up the boxes it would lessen the number of shooters, and give them a better chance, they think; but there is no reason why the shooting should be legislated into the hands of the owners and renters of the points. To test their sincerity, if box-shooting must stop, I propose that all ducking points shall be open to all sportsmen. If the above sportsmen had to accept one of these two horns of the dilemma, I think they would accept the sinkboat, if the consequence of driving her owner off the shooting grounds was that they would have to share their privileges with him.

Now as to the humanity of the two modes of shooting; for every duck bagged off a point it is safe to say that two or more are crippled. I am speaking of shooting into flocks, flying by points, and over bars, especially with the large guns used at Carroll's Island and other places in the vicinity. These ducks go off to die a lingering death, and although all shooting is more or less cruel, I think we ought to avoid any unnecessary amount of it. Now the amount of ducks killed on a point, if we take in all that are struck and lost as well as those bagged, in a good day's shooting, is not much less than those killed out of the box, only in the former case from one-half to two-thirds are wasted, while nearly every duck struck out of a box is killed, and the reason of this is evident, when it is understood that as a rule only small bunches of ducks decoy to a box, and generally spread out as they come in, so that a single duck has to be sighted at and killed or missed, as the case may be, and not a quarter of a pound of large shot poured into a large bunch of ducks, killing one or two and crippling a half dozen more that are lost.

If any shooting is to be stopped, that is the kind I should like to see put an end to. It takes little or no skill (I am speaking of flock shooting), and only requires a young cannon with unlimited ammunition. All shooting out of sailboats, or out of boats of any kind moving about among the ducks and chasing them off their feeding grounds, ought to be stopped entirely, but do not attempt to make fish of one and fowl of the other by saying sinkboats must be stopped, as that is only another way of saying that the shooting must be handed over to the fortunate owners and renters of points. Now suppose we put the matter in another way, and stop all shooting at wildfowl except out of sinkboats. This will put every man on an equal footing, as no one can commit a trespass in the water. I honestly believe it would increase the number of ducks, as it certainly would lessen very much the number of those shooting, as it requires a thorough lover of the sport to go through all the rough work and exposure required of the box-shooter, taking the winter's sport right through. I think we might ask this with as much justice as for the others to ask us to give up our manner of shooting for their benefit, particularly when I am well satisfied that battery-shooting, as pursued here, is no more detrimental to the fowl than the same amount of shooting in any other way, and far more skill and genuine sportsmanlike qualities are required for it than for any other form of duck shooting. Of course, where good shooting can be had from the shore over decoys, as is the case, I am told, in the Rush, Gunpowder and other rivers in that vicinity, it is very well not to use boxes, as there is no comparison between sitting in a comfortable blind on the shore and the hard work necessary in setting and taking up your box on a cold day. But here the case is entirely different, and I would and do much prefer all the work and discomfort necessary to box-shooting, to sitting in ever so comfortable a blind on the shore and getting nothing. As to point and bar-shooting, as compared to decoy-shooting, to my taste (and of course it is all a matter of taste) there is just the difference between going into the field with dogs and being without them. In other words, a great deal of the pleasure, to me, consists in seeing and working the ducks up to the decoys.

In concluding, give us fair play. The box-shooters will die hard unless you can prove to our satisfaction that our manner of shooting is more destructive to the fowl than your own. If you can do this, I am too genuine a sportsman not to give up what has been proved to be unsportsmanlike and destructive. In the meantime, if something must be done to lessen the number of shooters—and I admit that something of the kind is very necessary—stop all and every kind of shooting at fowl except out of the box, putting us all on an equal footing, as the water is free to all. This, I guarantee seriously, will do far more to protect the ducks than any other measure, for, if perfectly carried out, it would stop all banging from all kid-glove gentry, whose idea of duck shooting is a pull at the whisky flask for every duck shot at. Stop all greenhorns firing at everything that comes within a quarter of a mile of their blinds; stop all boat-shooting by day or night, and, finally, deprive no man of shooting because he was not fortunate enough to own or rent a point. Then limit the shooting out of boxes, if they get too numerous, to one or two days in the week, and you have the remedy for the over-shooting of the present day. In your article you speak of the introduction of boxes on Currituck Sound. Is not one cause for this, in addition to the box being the more successful and certain way of killing fowl, owing to the fact that so many (all in most cases) of the points are taken up by the clubs, and general shooting impossible? I will only add that I shoot solely for amusement, and am in no way interested in killing game for market, although I do not think that the fact that he sells his game should be a slur on any one, so long as he secures it in a legitimate and sportsmanlike manner, observing the close seasons and carrying out the game laws. SINKBOAT.

EASTON, Md.

[Our correspondent has fallen into the not uncommon error of imagining that we have some selfish motive in urg-

ing the abolition of battery-shooting. He therefore says, "Give us fair play, we box-shooters will die hard, unless you can prove to our satisfaction that our manner of shooting is more destructive to the fowl than your own." As a matter of fact, battery-shooting should be given up not in order that any man or any class of men may have better shooting than is enjoyed at present, but in order that fewer birds may be killed. Up to a certain point the fowl are competent to protect themselves from shore shooters. They can, if they please, stay out in the broad waters and away from the point, but they cannot protect themselves from batteries and booby blinds placed on their feeding grounds, nor from sail-boats, which follow them from place to place. The birds must eat, and when they wish to do so they will go to decoys anchored on their feeding grounds and so expose themselves to being shot. In most localities where batteries are used, it is a common practice for the tender in his sail-boat after the flight is over to visit all the rafts of fowl in the vicinity and "stir them up," in the hope that some of them may go to the decoys near the box. We must look at fowl shooting just as we do at every other form of field sport. As game and fish become more scarce, limitations must be placed on their capture, and the methods of destruction which are the most sweeping in their results are the first to be forbidden by law or by public sentiment. Thus the seining of trout is made illegal by statute because, while affording a most successful means of taking fish, it destroys on such a wholesale scale, that one or two men might in a few days capture all the fish in a stream. If it could be done, *i. e.*, if the whole community would bind itself to abide by such a law, we would welcome a statute forbidding the firing a gun at birds for a period of three or five years, but as such a law would not be observed, it would be most unwise to enact it. It would seem, however, that something must be done to preserve the birds. What shall it be? Does it not seem reasonable and wise to select that method which is most fatal to the fowl, and endeavor to have its use made illegal? Our correspondent acknowledges in effect that shore-shooting is less destructive than battery-shooting, when he speaks of "sitting in ever so comfortable a blind on the shore and getting nothing." So much might be written on this subject that at present we cannot undertake to treat it at any length, but we note that on several points our correspondent's position is very vulnerable. We shall hope to hear from others on this subject, for it is one that should be thoroughly ventilated.]

THE GAME DEALERS.

Editor Forest and Stream:

Nothing in the annals of the game laws and the protection of game has so nearly approached the perfect as the organization of the game dealers in New York for the enactment of just laws, the enforcement of such laws, and thereby the protection of game from impending and certain destruction. It is a glorious and commendable ending of the struggle and incessant strife that has so long been a perplexity to our legislators and the public in their determined efforts to destroy the game in this State. As a dealer in game I shall use my humble but earnest efforts in sustaining the Game Dealers' Association, and when the aforesaid just and efficient laws be enacted, receive the approval and signature of our worthy Governor, I shall employ a number of professional hunters, men of experience and familiar with the habits of deer, woodcock and other game, and during the open season send them out in squads and by companies to supply the demands of my customers during such times as "our" laws shall permit game to be sold; and I shall build larger and more convenient refrigerators than I now have for keeping a greater quantity of game than now can be sold within the unjust and limited season permitted, and I hope thereby not only to increase and make more plenty the game in this State, but at the same time accommodate and supply a larger number of customers, and add shekels to my treasury.

For the first two or three years this ample supply may bring the price down within the possibilities of the laboring class, the mechanic, the clerk, the merchant of limited means, but it is rather a serious question and quite problematical about the supply of game and the price after that time. I am somewhat fearful that my associate game dealers through the State may also do as I propose, and under such a state of affairs I will thank you, Mr. Editor, to tell me (confidentially) where and how any of us are to get any game. If all the game dealers employ hunters and build refrigerators and put in a greater supply, I am afraid there won't be any game for us or our customers in a few years. However, we are determined to have decent and fair laws, and will not longer submit to any restraints or regulations or laws that are not for our interest, game or no game, public or no public.

I invoke your valuable assistance, Mr. Editor, and that of good citizens in securing such laws as our Association may present to the Legislature. Help us, that game may increase and fill the land, aye, even our coffers with plenty.

DEALER.

JAN. 20, 1885.

CAPTAIN BOND.

Editor Forest and Stream:

Captain Bond of Long Beach, N. J., one day last week, having sailed from the beach to Tuckerton, endeavored to beat back across the bay, a distance of five miles, with a gale blowing dead ahead, and since has not been seen or heard from. No doubt he has perished in the bay, as was the case with poor George Clifford, who started from Beach Haven for West Creek during the prevalence of a treacherous northwest wind with too much sail on his "box." Your correspondent knew Capt Bond intimately, and has lived with him at his summer hotel during the months of July and August and in the winter when the brant were on. Who did not like him with all his peculiarities? and who did not desire most of all to have him as a companion at the bunches or at goose bar when fowl were flying? To know Capt. Bond it was necessary to be with him when his summer boarders had left him and to visit him in the ducking season. One point I always noticed when shooting with him. Long before it was time to take up our decoys and quit for the day Capt. Bond would put up his sail and start for the beach in order to have a hot meal prepared for us when we reached land and entered his house, on which occasions we would be saluted with the appetizing odor of roast brant with savory stuffing. Who that has been with the Captain at times I write of does not remember this? He loved Tuckerton Bay, and it seems a fitting burial place for the old man. Twenty or twenty-five years it has been his home, and even before he took up his residence on Long Beach he visited its waters in search of pleasure. Falling in love with the place he was induced to purchase the hotel standing on Long Beach at that time, which he altered and remodeled and made attractive and profitable, until Beach Haven, three miles south of him, was settled, since which time his business decreased. Captain Bond knew and often shot with Herbert and sportsmen of that time, and it was within a comparatively short time that he consented to discard his trusty muzzleloader for the more modern breachloading implement.

HOMO.

MASSACHUSETTS ASSOCIATION.

ABOUT 150 gentlemen were present at the annual dinner of the Massachusetts Fish and Game Association, at the Parker House last Thursday. Among the guests were Lieutenant-Governor Ames, President of the Senate Pillsbury, Speaker Brackett, Senator Milliken; E. B. Hodge and George W. Riddle, Fish and Game Commissioners of New Hampshire; Herbert Brainerd, Commissioner of Vermont; William M. Hudson and Mr. Bill, Commissioner of Connecticut; R. G. Pike, E. A. Brackett, E. P. Kendrick, president of the Springfield Rod and Gun Club, and P. S. Dwyer. President E. A. Samuels presided. At his right sat Lieutenant-Governor Ames and John Fottler, Jr., ex-president of the association; at his left, J. Q. A. Brackett and A. E. Pillsbury. The tables presented a beautiful appearance. They were elegantly trimmed with flowers and greens, and in the center were stuffed birds of various descriptions that were charming to look upon. The meeting was called to order by President Samuels, who delivered an address full of sound suggestions. He said:

These annual dinners of associations are always pleasant events. When you gather about the festive board numbers of congenial spirits, men whose tastes and studies and habits are largely similar, they will, they must, find the occasion an enjoyable one. For this reason the annual re-union of this association is always an event to look forward to with pleasant anticipations, and one to be remembered with the greatest delight. Not only are our annual festivals enjoyable, but our monthly meetings are also very pleasant and interesting, and it is a matter of regret to me that I have lost a great many of them.

First and last, I have mingled with many classes of society. Musicians, artists, politicians, scientists, literary people and sportsmen, but it is among the last-named that I find the purest and most unqualified enjoyment. Musicians are terribly jealous as a rule, particularly singers, and one must be continually on his guard lest inadvertantly he praises the C sharp of one more than the D flat of another.

Artists, unless they are fishermen, like our esteemed vice-president, are sensitive, suspicious and often as jealous as musicians. Politicians, with some few bright particular exceptions, are often uncompanionable, for the reason that their habits and education lead to watchfulness, reserve and distrust. Scientists are egotistical and often so far carried away by ideas that they become "cranky." But fishermen and sportsmen are always entertaining, sociable, free-hearted and enjoyable. Get together a little group of them at any time, such groups as I have often joined at our meetings, and start them on a fish story or an account of a hunting trip!

In the twinkling of an eye you are in imagination once more by the side of a wild mountain stream casting the fly above the royal salmon or beautiful trout. In fancy you see your fairy fly or Jock Scott or silver doctor wafted across the wide, deep pool, like a thing of life, to alight in the eddy away over in the shadows in just exactly the spot where you have at some time struck a memorable fish. You see the rise, you strike, you hear the scream of the reel and again you follow your noble fish down the stream over rough and slippery rocks, through the foam and boil, down many rods to the pool below. Again you bring to gaff the lovely prize and heave a huge big sigh of happiness. Oh! it is glorious, glorious sport! For twenty-five years have I cast the fly and I pray that I may be spared to cast it for twenty-five years to come. Yes, gentlemen, these re-unions of ours are thoroughly pleasant; they are enjoyable in every way; they represent the bright and attractive side of the life of our society.

There are two sides to every picture! Take one of Walter Brackett's peerless fish pictures, admirable, beautiful, as it is, if you turn the reverse side to you, you behold the unattractive bare canvas stretched upon a homely pine frame. In our association the unpleasant duties we are called upon to perform constitute the unattractive side of our picture. At our last meeting Mr. Reed very graphically described some of the disagreeable labors your officers and agents are called upon to perform; and probably just such unattractive work will be allotted to us among our duties this year; but we must not shrink from the task.

Two or three years ago, while out on a deer hunt, I crossed a lake in a small, leaky, cranky skiff. In this boat, in addition to myself, were my guide (a man nearly as robust as myself) and two large, heavy bucks, which we were carrying to camp. When we left the shore I noticed that the boat was but two inches out of water, but I did not pay much attention to this fact until we passed a point that jutted out into the lake. Beyond that point the wind was fresh, and as we got well out into the lake the water roughened up badly. The situation was far from attractive, I assure you, particularly when I found that my guide, after the manner of nine-tenths of fresh-water guides, could not swim a stroke. However, I braced up, kept the boat as trim as I could, and said to myself, "This is a pretty bad fix to get into, but no matter what happens, don't 'funk.'" Greatly to my relief, I am free to confess, we crossed in safety to the other shore.

Gentlemen, you have embarked in an undertaking of no ordinary magnitude, but no matter how rough the water may become, you must not strike your colors or steer from the proper course.

As the Massachusetts Fish and Game Protective Association it is our duty to employ all honorable means, to improve every possible opportunity, to secure protection and propagation of our birds and food fishes. If we fail to do this we have no business to exist as an association. There are many things we can do and ought to do soon.

It is not alone in the preservation of our game and food fishes that our association can be useful; it can as an educational institution perform great and important work. The history of the habits of our beneficial mammals and birds is still as a sealed book to the great mass of our farmers, and considering the great amount of literature on this topic that has been spread broadcast among them, this ignorance of the lives and methods of these agents, which nature has so bountifully supplied for their assistance and benefit, is remarkable.

In some localities, I am sorry to believe, farmers are sometimes ready to listen to the appeals of demagogues against such associations as ours and are perhaps led to believe that our aims and objects are hostile to their interests.

I wish my voice could reach to the remotest corner of the commonwealth to proclaim that we, instead of being antagonistic to the farmers, are constantly laboring in their best interests.

It is not the game birds only that we wish to protect! That is not what this association alone exists for. We are working just as earnestly, just as enthusiastically for the protection and greater diffusion of our native small birds, our thrushes and warblers and flycatchers and myriads of other insectivorous birds, the farmer's best friends. If he but knew how important, how valuable these birds are, and how anxious we are to preserve them for him, I am convinced that scientific associations, such as ours is, instead of being regarded with indifference, if not animosity, would be welcomed as most valuable institutions.

The labor we have engaged to do is not in the slightest degree selfish, and is not aimed to work hardship to any good citizen and honest man. We work without pay and without any hope or wish for remuneration, save the consciousness of doing good.

If he who causes "two blades of grass to grow upon a spot of ground where only one grew before," is regarded as a public benefactor, how shall we and kindred associations, be regarded if by persistent effort we succeed in multiplying some of our food supplies tenfold.

If we succeed in perfecting measures which will be followed by as good results as were those in the case of the lobster fisheries of Norway and Sweden; if we can succeed in securing the replenishment of salmon and shad and other migratory fish in our rivers in anything like the abundance in which they once existed, when so common were salmon in our streams that it was stipulated in articles of indenture that apprentices should not have fresh salmon on the table oftener than twice in one week; if we can create a public sentiment which will strive for the protection of our beneficial birds; if we can bring into disrepute the abominable fashion that is now in vogue of employing them in female adornment, a fashion which causes the death of thousands upon thousands of our beautiful songsters annually; if we can accomplish all these great and glorious undertaking, how shall we be regarded by the community?

Gentlemen, until we do accomplish them the verdict will not be recorded; until we do attain them all we must not rest.

President Samuels then introduced Lieutenant Governor Ames, who was received with loud applause. Mr. Ames thanked the association for honoring him with an invitation to be present. He did not know what the object of the association was before. He thought that it was to kill birds and to catch fish, instead of wishing to protect them. He related in an amusing manner his experience as a fisherman.

President Pillsbury said that the country members of the Legislature have an idea that the Massachusetts Fish and Game Association is composed of a Boston clique, who wish to have certain laws passed that will enable them to have all the game protected until a season of the year approaches when it is convenient for the members of the association to shoot the game. He hoped that the association would have better luck in the legislative halls of the State this year than it did at the last session. Speaker Brackett said that it was the duty of the association to protect game and to endeavor to have the Legislature pass suitable laws for that purpose.

The Hon Charles Levi Woodbury was the next speaker, and he was received with great applause. He said that there was a branch of American industry that the association should do all in its power to protect. He referred to the great American fisheries and claimed that the Washington treaty was an outrage upon the people of this country. He said that the treaty with Great Britain would expire next July, and it was the duty of the American people to see that this great industry be protected, principally because it was the means of existence to a part of our most hardy and industrious population—the fishermen. He said that in the early days the fishermen had the right to fish on all waters lined by American lands. This was a common law of the waters and it should be so to-day.

Speeches were made by Walter Brackett, Senator Miliken, E. P. Kendrick, the Hon. R. G. Pike, John Fottler, Jr., the Hon. E. P. Brown, Herbert Brainerd, P. D. Dwyer, E. B. Hodge and others. Letters of regret were received from John M. Forbes, Augustus Swift, Payson Tucker, Francis Endicott, C. B. Reynolds, of the FOREST AND STREAM, Fred Mather and others.

FROZEN DUCKS.

Editor Forest and Stream:

One of the most singular occurrences in the annals of hunting has been just related to me by a gentleman whose veracity is unquestioned, and who is himself a resident of the neighborhood where the phenomenon occurred.

At the confluence of Wolf River with Lake Poygan, in Winnebago county, Wisconsin, very early on the morning of Nov. 23, a boy who was passing along the river bank had his attention attracted by an immense flock of ducks, about 15 rods distant on the water. He was more than astonished at the unusual tameness of those otherwise wild and wary birds, as well as their incessant "jumping and diving," to use his own words. But a moment's observations convinced him that the whole flock were making the most frantic efforts to fly or dive, in neither of which could they succeed. The fact was, the ducks were literally benumbed or half frozen, and entirely unable to get away, and the unfortunate birds (very soon after the boy's discovery) were captured by the dozen with little difficulty by the neighboring farmers, with boats and poles, no guns being needed for the slaughter.

A small island close by was also found to contain several hundred more of the luckless birds, which had found a little shelter there from the terrible blizzard of the preceding night which, doubtless, had the effect of paralyzing them, and thus rendering them an easy prey to their merciless captors. The largest number killed or secured by one family was 218, and the smallest number, by a boy of fifteen years, was twenty-two. The slayers numbered thirty-five, men, women and children, and between them they secured the astounding total of 816 ducks, every one of which were mallards. Large quantities of this tremendous take were quickly denuded of their feathers by the thrifty housewives and brought to the neighboring city of Oshkosh, where they readily commanded from $2.25 to $2.50 per dozen. But the far greater number were packed and salted down for winter use. They were in fine condition, "busting with fat," and one dozen bought by a dealer tipped the beam at thirty-two and three-quarter pounds. A lean duck, however, is a *rara avis* in Wisconsin, as the great majority of our inland lakes and rivers abound with the grandest of all water-fowl food, the succulent and fattening wild rice.

As most migratory birds are wont to gather in vast flocks prior to their autumnal journey to the sunny South, doubtless the luckless flock whose destruction is herein recorded were on their way thither when the warring elements compelled them to seek shelter in that fated spot which proved to be their final resting place.

It was the first severe storm of the season, the day preceding having been beautifully fine; then a terrific rain and wind set in, which soon after changed to a regular blizzard of ice and snow. The oldest persons residing in that vicinity have no knowledge of any similar occurrence.

M. J. EGAN,

FRANKLIN, Wis., Jan. 20, 1885.

ADIRONDACK DEER HOUNDING.

Editor Forest and Stream:

I wish to record my vote on the right side in this discussion of game protection, particularly that of deer.

It is about twenty-five years since I killed my first deer. It was in October. I was trapping for mink and one day my route lay past a little pond. I stopped on its bank to view it with an eye to business, when I caught sight of a deer's head among the weeds, a couple of rods from shore and perhaps five from where I stood. The "boy" didn't have buck fever, didn't miss his mark, but went home (only a mile) to tell his father and get help to tote in the game. Why was that deer hiding in the almost ice cold water? That was what I wondered, and then I remembered that half an hour before I reached the pond, I had heard hounds partly in that direction. This explained it. Well, in those days we used to kill a deer whenever we wanted it—if we could. Hunters hunted in the fall for market, the best of them killing fifty to sixty during the season. That season being until Jan. 1 with one month more in which to dispose of their venison. And right here is where I want you to stick a peg. The law allowed them to kill only until Jan. 1. See a hunter Dec. 31 and ask him how many deer he had killed and he would say, "Fifty, but I have only got thirty drawn out of the woods, the rest are in beyond the Inlet and I have to wait for it to freeze." That hunter would go back into the woods and wait for the river to freeze, and if he could kill twenty more deer during the month of January he would, indeed, have the fifty first claimed. And the "peg" is this, whatever time is given to dispose of venison, after Dec. 1, will be used by most hunters to kill more.

In those days, twenty to twenty-five years ago, if a man killed a deer in summer, his neighbors were likely to get a large share of the meat. He was careful to kill only a buck, and many a doe has gone free from under the muzzle of the hunter's rifle "because she might have fawns, you know."

Then sportsmen came and hired these hunters for guides. They paid liberally for services, and their guides tried to please them. This was often by helping them kill more game than was needed. So as the years passed by, as the sportsmen became more numerous, the deer became less, until it was necessary to "protect" them.

We may here consider the relative destructiveness of the different modes of hunting. First, still-hunting. This method is very destructive at certain seasons with skilled hunters on the trail. Confine hunting altogether to still-hunting and less deer will be killed than now; but nine-tenths of them will be killed by the backwoodsman and will be sold in market. The sportsman may get the other tenth, but is not likely to do so, as he will not care to be in the woods at the season (after snowfalls) when success by this method is possible.

Now we will "float" for them. Deer are both wary and stupid. I have been at a pond a mile long and half a mile wide, where you could not open a light without having a deer "blow" and run if anywhere near the water. Again I have paddled a boat within twenty feet of one. Now a person can't go floating anywhere in the woods, he must have a body of water, a sluggish stream, a pond or lake, and one frequented by deer. That obtained, he must manage to be at a certain place at the same time the deer is. Now deer do not come to water every night. There are but few real good nights in the season for floating. Night number one is cold, number two the moon shines, number three the wind blows hard, number four a wolf or panther has been about, number five—well, number five is all right, and if the hunter is patient, careful, and a good shot, and his guide does his part, there is venison in camp next morning.

Taking everything into consideration, no method of hunting gives the deer so many chances for its life as floating.

Now for hounding. No matter what the season, no matter where the locality, no matter what the day, whether hot or cold, wet or dry, when the hound is put out the deer must go, and go it will for the nearest body of water, where the sportsman or market-hunter is waiting for his victim. Any one can kill the poor, tired creature then. If he can't shoot well enough, his guide can row him up near enough so he can beat its brains out with an oar. The victim stands no chance whatever for its life. In still-hunting the hunter may break a twig with his foot; a quick motion of the hand or a puff of wind may give the deer its life at the last moment. In floating, the paddle may strike the boat or something in the water, or the boat may go rasping through some rushes, the light may be dim or a dozen other things account for the salt pork eaten in camp next morning. Only the hound, with his keen scent and fleet limbs, is sure, for in winter the deer will seek the open water of rapids, and often, if the hunter is not waiting for him, will be drawn under the ice by the current.

Probably quite as many are killed by hounding that the hunters do not get as by any other method.

Hounding is prohibited in St. Lawrence county and we try to enforce the law. We are aided by a State game keeper who has several hundred miles of stream and lake to look after and can't be everywhere at once. We need two more on the north side of the woods. We are educating the people and building up a public sentiment in favor of protection. Many members of our club were non-observers of the law a few years ago. Many more give us their sympathy and money who never killed a deer and never expect to. They give it because they believe in this protection for the public good.

The law should prohibit hounding all over the State. The law should be so worded as to make proof and therefore conviction easier. You can hang a man on circumstantial evidence, but you can't so convict a man of violation of the game law, be it ever so plain a case. As an example, I was at Cranberry Lake early in September, '82. Our party (two and guide) had been in the woods two weeks and had killed one deer, and one dog caught in the act of running deer. One afternoon while at Bishop's hotel the little steamer came up from the foot of the lake and had on board a gentleman (albeit that a violator of the laws of the land should be called a gentleman), four or five guides and five hounds. On the deck of the boat was a very large doe with a single bullet hole in the back of the head. There was not one chance in a million but that that deer was killed forward of the dogs on the basin below the lake. Yet no court would convict on that evidence. The matter was laid before the assistant district attorney two days later, and though we could not hope to convict we tried another scheme that worked pretty well. We had the parties in court so often during the next month that we broke up the gang.

Again, one hunter will not go back on another. They regard it as dishonorable to do so, and men who are members of Christian churches will evade questions with the cheek and skill of old topers, when brought forward to convict for violations of the excise law. A case in point. Two years ago, two hunters were here at court, one for hounding deer, the other for catching trout on the spawning bed. Both were old men, old hunters who had run the woods for a quarter of a century or more. They were more than indignant; they were boiling over with wrath to think they should be so treated. The deer killer said (before trial) that whatever expense they made him he would pay in deer skins at twenty-five cents each. The writer labored with him like a missionary. First he advised him not to sell his deer skins at twenty-five cents each, as they would undoubtedly bring more. Then he told him that the St. Lawrence Game Club had over 300 members and meant business. That when he started out to kill all those deer they would send two men to watch him. Next, that they were protecting those deer much more for his interest than their own. That while no member of the club was likely to hunt more than two weeks at most in a season—and many of them would not at all—he could and would spend most of four months in the woods, either guiding at $3 per day (and where was his trade when the game was all killed?) or hunting for market. Finally, that being the case, they wanted him to help them protect the game. They much preferred him as an ally rather than an enemy; but in any case they would try to enforce the law against any and every violator.

This brought out his companion, who "pitched into" the writer rough shod, as he was leaving the dining room of his hotel. He "went for" the game club, which was making a poor backwoodsman cost and trouble while it winked at its own members who killed deer out of season. The following dialogue took place:

The Writer (taking out notebook and pencil)—"Please give me the name of this member. I will place the matter in the district-attorney's hands within an hour. We will make an example of this man; we will convict him on your testimony."

Woodsman—"Guess not. I know a gentleman when I meet him, and I don't go back on him, either."

Writer—"You have made the assertion that a member of the club of which I am a member has violated the game law. I do not know who you mean. Now I expect you to give me his name, or I must believe you are not speaking the truth."

By this time there was a crowd around, and seeing he must either tell or back down, he said, "Well, if you want to know, it is Mr. —— of ——."

Writer—"When did he kill the deer?"

Woodsman—"Last July."

Writer—"What time in July?"

Woodsman—"Oh, I couldn't tell."

Writer—"You can surely tell whether it was the first, middle, or last of the month?"

Woodsman—"It was about the middle."

Writer—"Where were they killed?"

Woodsman—"On the Inlet."

Writer—"Very well, I will place this in the hands of the district-attorney immediately, and you will be expected to testify in the case."

Woodsman—"Oh, I don't know anything about it; you can't prove anything by me."

This conversation was repeated to Assistant District Attorney Hale within an hour, and he interviewed the woodsman, who stoutly denied knowing anything about the matter. The Grand Jury had adjourned for the term, else we would have handed him over to it at once. Then we decided to try to get enough out of him to base a complaint upon and bring the matter before a justice. To that end the writer questioned him again, but he would tell nothing. Then we told him that unless he would give us the desired information we would surely bring him before the next Grand Jury. As he lived over thirty miles away, this was not pleasant. Then he took it all back, said he didn't know as Mr —— was a member of the club, and didn't know as he had ever killed a deer. In fact, the person named was not a member of the club. We believe he did kill deer (two), and that the woodsman knew it. Now, this long-winded story has been written to show how hard it is to convict in most cases, and that of all amendments needed to the game laws, such a one as will enable us to convict on such evidence as would be taken as proof in any other matter is the one most needed.

There have been many convictions in St. Lawrence county during the past two years and many more have been kept from violating the law through fear. Our assistant district attorney, Mr. L. P. Hale, has worked faithfully, and much of our success is due to his able efforts. But one game keeper and a few men who have little time to spare and whose only remuneration is the feeling that they have saved a few deer, for some city sportsman perhaps, cannot guard several hundred miles of wilderness so well but what some game will be killed out of season, or by hounding.

Again, some things that are legal strike us unpleasantly. For instance, a gentleman living in an Eastern city leased last year, a mile square, covering a certain lake some forty miles from here. His guide looked after it to some extent early in the season, and while the party was in the woods on their annual hunt the guide (?) sent a considerable quantity of jerked venison out and sold it. The party killed all they could use, all they could carry home, and some to sell and help pay expenses, while many residents of St. Lawrence county who have spent both time and money to protect the game had only salt pork in camp. Still we will continue to do our duty and hope the time will come when by proper amendment to the law a resident of another State will have to take his chances with the rest of us.

A TRUSTEE OF THE ST. LAWRENCE GAME CLUB.

CANTON, N. Y.

Editor Forest and Stream:

I was very glad to see the editorial in relation to the preservation of the deer in the Adirondack woods which appeared in your last week's issue. There doubtless will be opposition to the measure, to meet which we must consider the subject practically in its effects upon the parties most interested—the sportsmen's guides and resident population. The feelings of the deer hogs are not worthy of consideration. Their instincts are so cruel, their appetitss so brutal, they can only be restrained by the strong arm of the law.

The sportsmen visit the woods for health and recreation, and the presence of game is the strong attraction. That removed, they will seek other grounds. The guides and residents depend upon the sportsmen for their livelihood, and will be the greatest sufferers if the tide of travel turns in other directions. No one will dispute these statements. It all hinges, therefore, on the presence of game, which is growing less and less every year. Netting, night lines and fishing on the spawning beds are destroying the fish, and hounding is rapidly thinning out the deer, and it is folly to refuse to see it.

Old visitors to the woods, old residents and guides, have all told me that it was a common sight at any time to see deer feeding on the sloughs and water courses opening upon any of the well-known lakes. A sunset shot was always obtainable as the deer came to water. Such a thing is now unheard of except in some parts of St. Lawrence county, where hounding has been prohibited for several years. The Saranac Lake country formerly abounded in deer and the waters in fish. The river between the lower lake and Round Lake was a choice spot. You might hunt there now until the crack of doom without success unless you have dogs out. The shores of Raquette River were thought to be deep in the woods, and it was not necessary to go so far to get game. Now you will never see a deer on the river unless it has been driven there by dogs. Each year the deer seem to be further back, and long, tedious journeys are required to reach the supposed desirable spots, and even then success is not assured. The only reason for this is the incessant hounding. Stop that, and the whole region will be as before—a sportsmen's paradise. To prove this I will relate the following incident: A certain portion of the woods not far distant from one of the large hotels, had been abandoned by hunting parties for several years, as the deer had been either killed or driven away, and a dog had not been through there for a good while. Last year a guide went in and found any number of deer, which were slaughtered in the usual way.

Guides who understand their work rarely hunt the same ground steadily for several days. They change it, and invariably find that the quiet has encouraged the deer to come back. Think what the result would be if a hound's voice was never heard. Under the present practice fawns are as liable to be driven as large deer, in fact more so, as their restlessness gives the dog more chances of striking a trail. If fortunate enough to throw the dog off and also escape the bullet of his master, it is likely to die of exhaustion. Wet does are driven from their fawns, and after long runs, thoroughly heated, take to water to meet their death, if not by the hands of man, in the sudden chill to their lacteal glands; and thus the voice of the hound becomes as fatal as the rifle of the hunter. By killing the does and fawns the source of supply is destroyed, and the end comes very quickly.

The true sportsman cannot bear the present method, it is only tolerated because, while it exists, nothing else can be done. Some of us endeavor to be as decent about it as possible, and refuse to shoot at a less distance than seventy-five or one hundred yards, preferring to let the deer go if we can't hit it at that distance. This, however, does not palliate the viciousness of the method, it only soothes the conscience of the individual. We will be more than glad to co-operate in securing the passage of the law prohibiting hounding, and in the enforcement of it afterward.

The guides will themselves support such a law, as there are but a few who uphold the use of dogs, and as a rule they are but little account. The dog is expensive to buy, expensive to keep, a burden to transport and a constant cause of anxiety, if he does not return at night after a hunt. They are constantly being lost or stolen, or something else is happening to them which renders them a nuisance. If a man loses his dog he spends several days in search of him, which is necessarily a loss either to the employer or the employed. A guide without a good dog in the fall of the year would find it difficult, I might say impossible, to obtain employment. Think of it, a first-class woodsman cannot make his knowledge avail him anything unless he has a dog, and then he is only on an equality with a less desirable man who has perhaps a better dog. Dispense with the hounds, and a guide's knowledge of woodcraft becomes his stock in trade, he who has the most secures the largest custom. From what I know I believe there will not be any more earnest supporters of the measure than the guides.

Suppose the present conditions changed, and for two or three years a dog has not been seen. The does and fawns, unworried by dogs and spared by man, have multiplied and grown. Take your rifle, you need not go far, your success now depends on your prowess, every sense must be on the alert, the eye must cover every object, the ear be alive to every sound, and the feet must learn where to tread. Your quarry has the best of it, as he sees and hears further than you, and besides has his wonderful nose to warn him of your approach. As the sportsman should, you are giving him a chance to use the powers that nature has endowed him with. It is pitting your skill against his instincts, each having the fullest swing. How great your pride, then, if you can drop him as he bounds away, startled out of his bed, which you have approached within easy rifle shot. Is it not more manly than potting the poor creature as you would a calf in a pen? The recollections of such an experience are lived over and over, and the thrill of pleasure which filled every moment will cause your blood to tingle for years afterward.

H. I. W.

Editor Forest and Stream:

In the name of every sportsman who visits the Adirondacks for deer hunting I protest against any such backward movement. Of course most of the venison sold in New York comes from the West, but only those who live on the railroads that run back into the woods, as I do, know how many deer are sent to the markets from the Adirondacks. The law that none shall be killed in December is a dead letter as long as hunters have that month to dispose of them in. The day before Christmas seven large deer were taken through this village. They showed every evidence of having been killed during the previous week. Our game protective association was powerless in the matter, and dared not swear out a warrant, because the proof that the deer were killed this month would be well-nigh impossible to obtain.

Parties who were in the woods around here during Christmas week tell me that in swamps and among evergreens the snow was nearly waist deep, and personally showing how much deeper the snow north of Lake Pleasant is than here, I fully believe that those deer were yarded after the rain and crust of the 20th, butchered and marketed under the law that professedly was forever to stop winter killing. The secretary of our game protective association has written to all the game clubs we can learn of around the Adirondacks, asking them to combine with us in getting a change in the law, so that while the cities can have their Western venison for the holidays, the temptation of crust-killing will be removed from our guides by a law that forbids the carcasses of any deer killed in this State being held in possession after Dec. 1. Such a law would arm every sportsman around the Adirondacks, and stop what this year has proved a veritable slaughter, as I

believe that more deer have been killed and sent to market since snow came, than were killed during the open months. What Gen. Sherman says in his hatchery report of the poaching tendencies of most of the inhabitants of southern Hamilton county is certainly true, but they are not so bad now as they used to be, and such a law as I advocate would stop another bad failing of theirs. The game constable of this section promised us to watch them this past month. If he accomplished anything, we have not heard of it, but we hope to get a report from him soon that may tell another story. M. S. NORTHRUP.

JOHNSTOWN, N. Y.

Hunting deer with dogs has been absolutely forbidden in all the towns of Washington county by the Board of Supervisors, who also legalized the shooting or otherwise killing of dogs while chasing or tracking deer. The residents of Dresden, Fort Ann and Putnam will see to it that the latter part of the enactment is fully obeyed, both by their neighbors and outsiders.

We have for distribution a printed petition to abolish deer hounding in the Adirondacks. It will be sent to any one who will secure signatures. The petition reads as follows:

To the Honorable, the Legislature of the State of New York:

We, the undersigned, residents of the county of N. Y., respectfully petition that Chapter 543 of Laws of 1874, entitled "An act for the preservation of moose, wild deer, birds, fish and other game," be so amended as to absolutely prohibit the chasing, running and hunting of moose and wild deer with dogs, at any season of the year, on the ground that such chasing, running and hunting with dogs is very destructive to such game and is rapidly destroying the same.

OPEN RIFLE SIGHTS.

Editor Forest and Stream:

The greatest obstacle in the way of rifle shooters, who have reached that age when spectacles are necessary, is their inability to see their sights and draw a bead, as in younger years.

While a man at fifty can do nearly or quite as well with globe sights as ever, he finds himself all at sea with open sights of the usual kind. The Lyman sight, which supplies a long-felt want, while it is practically an open sight, would be ruled out of most country matches with all other aperture sights.

I have used an open sight, with which a shooter of fifty can do better work than he could with the old kind at thirty. Such, at least, is my own experience.

The back sight should be as near the eye as possible—close up like a peep sight, straight across the top, the notch simply a perpendicular slot of uniform width, one-fiftieth wide and three-fiftieths deep. The front sight must be black, of usual height (one-eighth to three-sixteenths) and the thickness of a dime, which may vary according to the distance they are apart.

In looking through them the notch will assume the shape of a half circle, and have a dim twilight look, through which the front sight can be clearly defined on a white object. The effect is very similar to that of globe sights. A square white target, in size about 5 to 6 inches for 50 yards, 10 inches for 100 yards, will be found to give the best results, the advantage being in favor of large targets, as the center can be as easily located as on a small one, and will enable the marksman to hold for wind, etc., a great help in the absence of wind gauges. SKEPTIC.

MICHIGAN.

JANUARY DOGGING.—A correspondent writes from Alder Bend, Clinton county, this State, under date of Jan. 16: "The woods about Chazy and Chateaugay lakes are full of deer-hounders to-day."

COUNTY LAWS.—Will our correspondents favor us with copies of county or other local laws relating to game or fish?

TEXAS.—El Paso, Jan. 13.—Wildfowl shooting is good here. The large game is growing scarce.—G. W. B.

Sea and River Fishing.

LARGE CATFISH AND PIKE.

DURING the days of the Pennsylvania Canal, Leesburg, Pa., was a famous fishing place for Pittsburgh gentlemen, and being easy of access, some splendid sport was had.

Col. Ulam kept a hotel, at which all the sportsmen stopped. The largest fish caught by any was a catfish of 100 pounds, and shortly after, by another party, one of 50 pounds. The big pike mentioned some time ago by "Little Sandy," was caught by a party from Pittsburgh, who came annually about the time the leaves began to fall to trail for pike, and loudly was their coming hailed by the boys, as it meant many a dollar for getting bait.

Among them was Col. ———, and Messrs. Douglas and Mr. Gray. They had agreed to fish till a certain hour, when the side getting the least weight of fish was to pay for the trip. On the last day the side headed by Col. ——— was badly left, a fact that made the Colonel very blue. So he got a fine lot of chubs and went up to Kepple's Point for a last trial. Floating down the slackwater in his copper boat, he hooked a monster pike just opposite where D. B. Ashbaugh now lives, and after about three hours' hard fighting safely landed him.

This was triumph enough for one day, so putting a stick through the fish's gills he shouldered him up and marched proudly into town with the tail of the fish dragging on the ground. A scale was procured, and the pike on being weighed put the Colonel's side far ahead of the others, who had, by reason of the lucky catch, to pay for the trip.

At that time this slack water was the home of a fish locally known as the "whitefish," which for table qualities was sought for far and near. It was somewhat like a bass, but smaller-mouthed and deeper through from the back. It was a magnificent biter on small minnows, but not game. I have gone out when a boy with my uncles or grandfather and had royal sport with this fish. One morning in particular I caught five while uncle was fixing his rod and line.

Here, by the way, is a good pike, too. One morning grandfather had come down to the river to wait for a packet-boat due, to apprise the captain that his wife was sick. Seeing the wake of a large fish coming toward him, he sat perfectly still, but the fish turned and went back. In a few minutes he saw it again, when it came to shore and got among some locust brush and became entangled, when the old man sprang on it, and getting one hand in its gills and the other under its body he carried it to the towing path and laid down across his fish, thus holding it until it exhausted itself. This fish when swung from his shoulder touched the ground.

These are not "fish" stories but facts that can be vouched for, and many more from this fisherman's paradise now passed away forever, by reason of the breaking of the dam. WILL MONTGOMERY.

LEECHBURG, Pa.

SNELLING HOOKS.

Editor Forest and Stream:

Under the caption of "Snell, Snood and Gimp," "J. W. T." brings up a question well worthy of a thorough discussion by anglers. The best method I have tried is as follows: Grasp the hook by the bend in a pair of pliers, and heat the tapered end of the hook in the flame of a spirit lamp till it will melt wax readily. Then give it a coating by rubbing it on a lump of shoemaker's wax. The hook should be hot enough to burn it on, so as to form a smooth, even coat of wax. Then tie on snell in the usual way with waxed silk thread and finish with shellac. An occasional coat of shellac will preserve them till worn out. They will never slip.

The object of using the pliers is not only to prevent burning the fingers, but to prevent the heat drawing the temper of the hook above where it is grasped by the pliers. N.

Editor Forest and Stream:

Will you allow me, through your columns, to return thanks to the many kind friends who have answered my queries as regards snelling, etc. Lack of time forbid my answering them personally, or rather, individually, and I trust they will accept this public acknowledgment of their kindness shown to an entire stranger. Incidentally, the locality of their replies shows the wide circulation of FOREST AND STREAM. Look at this list:

"H. C.," Ft. Spokane, W. T.; "A. K. H.," Bergen, N. J.; "P. R.," Ft. Garry, Manitoba; "M. A. R.," Yuma, Arizona; "F. K.," San Felipe, Col.; "B. A. N.," Mahlon, Iowa; "F. S. P.," Denver, Cal.; A. N. Cheney, Glens Falls, N. Y.; "Amateur," Somerset, Pa.; "W. T.," Ripon, Wis.; "R. N.," St. Johns, Newfoundland; "S. H. J.," Mankato, Minn.; "H. H.," Dalton, Ga.; "R. S. O.," Machias, Me.; "Pete," Sing Sing, N. Y.; "A. T. S.," Berne, N. C.; E. A. Leopold, Norristown, Pa.

Which proves two things. First, as I said before, that FOREST AND STREAM "spreads itself" over a great deal of ground, and secondly, that anglers, as a fraternity, are not the selfish beings that some persons take them to be.

"Shake," brothers; and I hope a kind Providence may some time allow us to "wet a line" together.

H. P. UFFORD.

CASSELTON, D. T.

SEA TROUT FISHING.

THE observant angler, as he casts his flies over the rivers of Canada which flow into the ocean, will notice a marked difference in the habits, form, and color of the trout of those waters, and the native fishermen will tell him that these are sea trout and those are river trout. The sea trout run larger in size, are more slender in form, and more silvery in color, than the river trout. In some streams, the sea trout are most numerous, in others the river, while in other waters the two may be taken side by side, rising to the fly with equal eagerness. At certain periods of the summer, the sea trout come into the mouths of the larger rivers with the tide in great schools, like mackerel, and feed as greedily, all in a school being of the same size, say from one to three pounds in weight. At these times nothing can surpass the sport afforded to the fly-fisher by the sea trout. One of the most vigorous and active of fishes, and with a pair of three-pounders on a light rod, the skill of the angler will be taxed to the utmost. English writers on angling, Davy, Francis, and Pennel, assert that the white trout or salmon trout of the tidal rivers of Scotland and Ireland, *Salmo trutta*, is one of the gamest fishes that swims, and I think that his Canadian cousin is not at all behind him.

The habits of the sea trout of Canada (*Salmo canadensis* Smith) appear to vary in different rivers. For instance, the Nouvelle, which flows into the Bay of Chalheurs, is a most beautiful stream, clear, cold, and swift, and an ideal salmon river, formerly abounding with that fish, which are now excluded by a large raft of logs near the mouth; there the sea trout alone occupy the water. They run very large, from two to five pounds; a string of fifteen which I took there in 1871, averaged two and a half pounds. In this river they lie like salmon in certain pools, and are not found elsewhere, and they take the fly under water, as a salmon does, and I found the flies with which I had taken salmon the week before in the Restigouche, to suit these trout well. Their play is peculiar, and unlike that of the river trout, and the quality of the fish is superior to that of any river or brook trout that I ever tasted, and I have eaten them from Lake Superior to Maine, and from Minnesota to Cape Cod.

In the Tabusintae, a famous river of New Brunswick, the sea trout and river trout are taken from the same pools, in about equal numbers. This is a more sluggish stream than the Nouvelle, with darker water, and the fish are smaller and more numerous. My basket, in a day's fishing, averaged half a pound. In the lower portion of the Restigouche, where it flows through open meadows among islands, the sea trout abound, though not of large size. In the upper waters, about the salmon pools, I found the river trout to prevail; in fact so numerous were they, that in casting for salmon, the big fly would often be taken by a pound trout, so that they became as much of a nusiance as I have found the chub in the Adirondacks, when casting for trout. At the mouth of a brook opposite our camp I used to cast sometimes with three flies, and was sure to hook three trout at every cast. They were small, about five to the pound, but in New Hampshire would be thought good-sized fish of good value; here they were a drag, no one would eat trout, preferring salmon; so after the first day I turned them all loose.

In the short tidal streams of Prince Edward's Island, I found sea trout in abundance in July, from four ounces to a pound in weight, and rising well to a fly. In June they are found at the river mouths in abundance and of large size.

Naturalists tell us that there is no organic difference between the Canadian sea trout and the river trout. Their teeth, bones, scales and fins are alike, and while I accept this statement, as an angler I agree with Mr. Hallock and others, that though they may be of the same "species," yet that the Canadian sea trout is a good "variety." Many writers, otherwise well informed, use the words species and variety indiscriminately, as if their meaning was the same, which is not the case. The definition by Cuvier of the term "species" is a "succession of individuals which reproduces and perpetuates itself." A "variety" is described as a "lesser distinction, which seldom endures beyond the temporary causes which occasion it."

Thus the horse and the ass are of the same genus, but of different species, and if they interbreed, their offspring, the mule, is unfertile. The race horse and the dray horse are different varieties, caused by man's devices, and their offspring is fertile. So angling writers when they mention the taking of bass, sheepshead, and other "varieties," should call them "species."

Some writers have confounded the sea trout of the British Islands, *Salmo trutta*, with the Canadian fish, but although similar in habits, they are evidently of different species. Professor Storer describes a sea trout of which he procured a single specimen in Labrador, under the name of *Salmo immaculatus* or the "unspotted trout," but this clearly differs from *S. canadensis* which has red spots like *S. fontinalis*. In "Salmonia" the European sea trout is represented as a spotted fish, growing to the weight of ten pounds, and Sir Humphrey Davy ventures the suggestion that this sea trout, *S. trutta*, is the true typical trout, from which the two or three other species of British trout have been evolved, by natural causes, difference in food, water, and other accidents. As the publication of "Salmonia" antedates by some twenty-five years that of Charles Darwin's famous book on evolution, it would seem that there are two claimants at least for the merit of the invention of the hypothesis of evolution, Lamark and Davy, prior to that of Darwin. S. C. C.

THE BEST PANFISH OF THE WEST.

Editor Forest and Stream:

In your issue of Jan. 15, your correspondent, "Jay," has struck a note that will certainly interest anglers of the West, as well as those of the Middle States, especially those who must content themselves with the sport the "newlight" (croppie) affords. For be it understood the black bass in the waters of our immediate neighborhood are few and far between.

The "newlight," *Pomoxys annularis*, seems to stand the draft made upon it better than any fish we have, some having been caught here weighing three and a half pounds. Our streams in the spring, as well as during seasons of drought, are subject continually to the ravages of seines, drag-nets, traps, and dynamite, by whites and blacks, the latter preferring the cover of the night so as to extend their nefarious work on lands that are posted. Fish laws are entirely out of the question, as it is impossible to get a grand jury in Bourbon county to indict any one for seining. People believing that when one pays one hundred dollars per acre for farm lands, and the creek runs through it, the fish belong to them, and they have a right to catch them in any manner and when they please. The only question is to catch them, the more the better, the quickest way preferred. Last fall our creeks dried up to such an extent that for hundreds of yards the creek beds were perfectly dry, and as one of our local anglers remarked at the time, "There was not enough water in the mill dam to swim a tadpole."

Yesterday, after two days of heavy rain caused a big rise in the creeks, a number of residents turned out to fish with drag nets. I examined a basket of one of the returning parties who had caught a large lot, and found a number of them weighing over a pound each.

Is it not astonishing that this delicious fish, so harassed and persecuted, should return to us every spring with swelled ranks, and go through the same "fiery ordeal" without any perceptible difference in numbers?

I do not claim that the "newlight" (croppie) is a game fish. I have used lighter tackle (of my own manufacture) than I have seen used in this community for his capture, and I believe with suitable implements he would afford more sport to those that are willing to catch him in a legitimate way than he now does. I am satisfied that Dr. Henshall has often met him near his home in Kentucky, and probably caught him on a light fly-rod with a cast of flies.

I have "held up my hands" for what he has written on the black bass, and will hold them up time and again if he will favor us with a description of the proper rod and flies for the capture of one of "the best panfish of the West."

LITTLE SANDY.

NORTH MIDDLETOWN, Ky., Jan. 15.

DRAG AND CLICK REELS.

Editor Forest and Stream:

In your last issue "Petra" requests me by name to tell him "what is the use of a drag and a click in the same reel." It is apparent that he is well aware that both subserve precisely the same purpose.

As it frequently has to others, so the use of this combination evidently appears to him pretty much like a man going quail shooting with two double-barreled shotguns, one over each shoulder. Still there is a practical difference between the drag and the click, for the former is silent, while the latter is not.

There may be some who at times, when angling, wish no tell-tale click to herald their success; while without reason for the sacrifice, they are unwilling to forego the music of its voice. I understand that this form of reel was designed to meet the wants of this class, as well as those of localities where the click and drag divide public favor.

In brief, this combination reel was made to sell.

"Petra" makes some very timely remarks in reference to correspondence among anglers in your columns. I have expressed myself before on this subject, and I now repeat that they show a deplorable lack of public spirit among the angling fraternity.

Compared with what there is to be known about the art we love so much and its appliances, how scanty is the knowledge of even the best informed. No single man can by possibility do much for its advancement, but by the united efforts of all, each contributing something, even though but little, great progress is assured. The experience of every man is not only of necessity limited, but the experience of no two men is precisely the same. Good cannot fail to follow a public interchange and comparison of these.

While as a class we are perhaps somewhat prone to theorize with too little regard for the wholesome check of practical experiment, still pure theory is better than absolute silence; since if the theorizer will not, some other may apply the test and make known the result. Anything is better than absolute stagnation.

The harvest is everywhere abundant, but, alas! the gleaners are few.

"Petra" sensibly remarks that "an excellent way to bring out correspondence is to ask questions."

Unless I am altogether mistaken, one of the chief purposes of this portion of your paper is that all who seek light on any angling subject may therein make their wants known, and that all who have light on the matter may respond.

I will therefore ask a question:

Who has had practice in working aluminum-bronze, and how does it solder, file, turn, behave between a forming-punch and die, and draw into tubing?

I am informed that a new process of production has reduced the value of aluminum from $1.25 an ounce to something like 50 cents a pound. The low specific-gravity of this metal (2.60) is offset by its softness, lack of stiffness and elasticity, solubility in alkaline solutions, and its refusal to solder. Alone, therefore, I think it merits little attention from the angler. But its alloys with copper are quite another matter. Aluminum-bronze—10 parts aluminum to 90 parts copper—is said by some authorities to be the most rigid metal known. It is of a red-gold color, tarnishes with reluctance, is somewhat lighter than brass or german-silver, and will solder. Unless there is some unexpected difficulty in working it, it should be invaluable for reels and rod-trimmings, its greater stiffness rendering it superior to german-silver, while it is, or soon will be, much cheaper.

One gentleman informs me that it is liable to crack at the solder-joint during the process of drawing into tubes; while another says it stands the much more crucial test of stretching on a mandrel perfectly well. I should be much pleased to hear from some one with extended experience in working this alloy, since both of the gentlemen alluded to gave but the result of a single isolated experiment.

Some experiments with phosphor-bronze have so occupied my scanty leisure, that I have been as yet unable to try the aluminum-bronze myself; but I hope soon to take it in hand, and then should of course like the guidance of what others have done.

I might say while on the subject, that these experiments with phosphor-bronze, while not as yet decisive, are still full of promise. I have made two reels from it, and am about to test it in ferrules. When a conclusion is reached, should it be worth publishing, you will probably hear from me.

HENRY P. WELLS.

NEW YORK, Jan. 26.

A CHALLENGE TO FLY-CASTERS.

Editor Forest and Stream:

I respectfully ask you whether there are any two men in the United States that can cast a fly further than I or my son Thomas. As I am anxious to see this challenge taken up, I am willing to throw on stream or pond, as made by nature, from two different positions; that is, we throwing with them from points chosen by them, and they in return throwing from points chosen by us, adding total casts made.

HARRY PRICHARD.

NEW YORK, Jan. 21.

THE MOST KILLING FLIES.

Editor Forest and Stream:

In a short note in your issue of Jan. 15 "Poke o'-Moonshine" touches on the point of names for artificial flies and gives the first public howl about the way in which all but the most prominent flies are named differently by different dealers. Many flies are burdened with half a dozen names; sometimes there is the slightest difference of a thread, which, as your correspondent says, a trout would never see, but it does not amount to anything. We read of flies, in almost every article on fly-fishing, which we never heard of before, and which no one but a small circle knows of. For instance Mr. Wells speaks of the "Parmachene Belle," probably a local Maine name, and in Vermont some fly-tyer may call it the "Green Mountain," while in Nevada it might be known as "the last chance."

In his article on the grayling, in the Orvis–Cheney book, Mr. Fred Mather first alludes to the evil by describing a fly, and pretending that he does not know its name, "owing to a defective memory and the vagaries of fly nomenclature," he flings a stone into the camp of fly-namers, but does not follow up the assault. "Poke-o'-Moonshine" quotes Holberton's plate of "standard flies" as the standard. Is it anything more than Holberton's standard? Do other tyers and dealers recognize it as a standard and tie and name by it? Take his royal coachman, it differs from the fly of the same name as published by Orvis. The latter's has a tail and two bunches of green and two of red on the body, while Holberton's has no tail and only one patch of each color. Holberton's "professor" has a patch of green near the head which is lacking in Orvis's plate, while the flies called "Abbey" by each differ widely.

It is not necessary to go further to show the "vagaries" of fly nomenclature which seemed apparent to Mr. Mather, although he did not care to fight the vagaries as he should. Perhaps he thinks it sufficient to hint at them and let others fight it out. We have all met the difficulty mentioned by Mr. P. O. Moonshine in your last, of sending to one dealer for a certain fly, the name of which was learned at another house, and getting something different. If a man always trades at one house and does not talk, write, or read about flies, then it makes no difference what they are called, but readers of FOREST AND STREAM want to know just what flies are meant when a writer uses their names. Whether the evil can be remedied or not it is hard to say, certainly not as long as things slip along as they are.

WHITE HACKLE.

ALBANY, N. Y., Jan. 19.

Editor Forest and Stream:

I have taken much interest in the articles under this heading, and beg leave to give my experience (limited as it may be). I have made a special study of flies, but am a believer in only a very few. My variety of trout flies can be counted upon my fingers. Last summer I spent six weeks among the headwaters of the Dead River region, Maine, experimenting with a profuse variety of flies to satisfy myself. I have found the following cast the most practical killer for all times of day and kinds of weather, viz, Reuben Wood, Lord Baltimore and red ibis, especially when the trout are of large size. If fishing late in the evening, I occasionally substitute a coachman for Lord Baltimore. I invariably use small-sized hooks and flies; am satisfied they are the best killers.

I always carry a cast made up of the following: Brown hackle, red ibis, and a fly that I have made for me, similar in every respect to the professor, with the exception of the body, which is red with gold tinsel (this fly, by the way, I use more of than any other). I find this cast takes better when the trout run small.

For bass I have found the polka, blue bass and split-winged ibis the most practical flies. In this instance large sizes.

H. B.

BOSTON, Jan. 15, 1885.

RESULTS OF UNLAWFUL FISHING.—A Neenah, Wis., paper states that it has it on good authority "that no less than 2,700 barrels of fish were shipped from Oshkosh and points on the east shore of Lake Winnebago in the year 1884. Of this vast amount of fresh fish, mainly black bass, fully two-thirds were caught illegally or contrary to the law. The result of this fish piracy is that Lake Winnebago has degenerated from its once famous reputation as a fishing resort to a mere delusion to the angler with rod and line. It has become a vital question to the interests of this whole section whether or not the old reputation shall be re-established. There would be ten summer visitors to this part of Wisconsin where now there is one. More than this. If so protected from Oshkosh fish butchers, the poor man in all this section could occasionally secure a fine mess of fish for his family where now they are dragged in by nets and shipped south to keep a few fish pirates in work and money. Let some good law be enacted and let that law be enforced to protect the interests of Oshkosh. Neenah and all this section demand it. We are glad to see many Oshkosh citizens interested in this matter, and among them Mr. G. F. Stroud. It is time something in earnest was done in this direction."

BARBLESS HOOKS.—Sing Sing, N. Y., Jan. 24.—In your issue of Jan. 22, "Petra" wants to know what kind of barbless hooks I used. When I said barbless hooks were not worth a cent, I surely did not think that the things that "Petra" has been using for the last several years would be confounded with mine. I meant a plain hook without a barb, made of very finely tempered steel, with a very sharp point. Who were the manufacturers of the hooks I don't know, but I am pretty nearly certain that the firm that made such things is bankrupt by this time, for it is four years since I used the hooks. The hook that "Petra" uses seems to have a slight savor of the pot.—PETE.

Fisheulture.

VITALITY OF CARP.

SOME time ago we recorded a case where a carp wrapped in a copy of FOREST AND STREAM had lived for many hours out of water. We now give two similar cases, taken from letters written to Professor S. F. Baird.

Wishing to examine some scale carp anatomically, says Charles W. Scudder, of the United States Fish Commission, on Jan. 2 I visited the central hatching station of the United States Fish Commission in the Armory building, and called for dead carp, as they would answer my purpose as well as live ones. Mr. J. E. Brown handed me seven or eight, which were from one to three inches in length, and which had been thrown out of the tanks as dead. These I at once put into an envelope and carried home in my pocket.

At least an hour later I removed them from the envelope and put them in a wash-bowl of water for cleansing them. I soon noticed that two of them were floating on their sides and occasionally gasping. A half hour after this, for the purpose of discovering how much vitality there might be in the two in which I had observed signs of life, I placed in the mouth of each one a drop of brandy diluted with an equal amount of water. These I returned to the bowl, and paid no further attention to them until six hours afterward. I then noticed that the two which had received the tonic showed a marked improvement, and were swimming on their sides nearly at the top of the water. I then changed the water and administered the same amount of brandy as before. On the following morning, thirteen hours after the first administration of brandy, and seven hours after the second dose, the two fish in question were apparently fully restored, and were swimming naturally and actively about the bowl. The restoration proved to be complete.

From a lot of twelve hundred carp, writes Milton P. Peirce, of Wenonah, N. J., to Prof. Baird, one of my assistants threw out one hundred and ten which he supposed to be dead. I do not think they were dead, but only torpid, for one was left floating in the tank when it was replaced in the store. A small boy called who was going on the street-cars to a distant part of the city (Philadelphia). The mechanics gave him the supposed dead carp, which he wrapped in a piece of paper and placed in his pocket to show to his chum. After reaching his destination and playing a while, the two boys passed into a room where the goldfish tank stood, when he thought of his carp. The boys thought they would give the lady of the house a surprise, and so placed the carp in the tank. An hour or two later the lady discovered a strange fish swimming in her aquarium in an erratic manner, and, upon inquiry, learned from the boys the almost incredible facts. Two weeks later she called and related them to me, saying that the carp was well, lively, eating readily, and growing rapidly.

GROWTH OF CARP.

SOME surprising evidences of the growth of the German carp have recently been seen in New York city. Last week Mr. E. G. Blackford had on his slabs, in Fulton Market, a lot of carp from the Potomac River, one of which, a leather carp, weighed over fifteen pounds, and a scale carp of thirteen pounds. The fish are some that were captured at large in the Potomac, having escaped from the Government ponds on the occasion of a freshet which backed the water of the river over the ponds and released several thousand fish of four and five inches in length. This occurred some three years ago. As there were no carp in the river previous to this there is no difficulty in tracing the origin of these fish and the date of their escape. The daily papers had notices of these fish, and many persons saw them.

Another instance of their growth was seen when the lower lake in Central Park was cleaned. Residents of the neighborhood of Fifth avenue and Fifty-ninth street expressed fear of a malaria epidemic because of the proximity of the lake in its dirty condition, and it was ordered to be cleaned. This necessitated the drawing off of the greater portion of the water, which in turn required the transfer of fish. The numerous carp removed were the results of increase from 15 imported German fish, about an inch in length, which were presented to the Park Department, by E. G. Blackford, State Fish Commissioner, and placed in the lake in 1879. Over 100 of the fish, weighing from 12 to 13 pounds, and measuring over 25 inches in length, were taken out, and the number left, consisting of minnows, all the way up to 10 or 15-inch fish, were estimated by thousands. One of the larger fish, 30 inches long and weighing 13 pounds, was placed on exhibition at a fish market on Third avenue, and is to be served at a dinner to be given by a German society. The live fish were transferred to the upper lake in the park.

The Germans place the carp above most all other fish for the table, and great numbers could be sold in New York city. There is no fish so easily raised as carp if suitable waters are given it, but cold lakes and trout ponds are fatal to it. No doubt it will produce more food to the same area of water than any known fish. Its introduction has been of great value, especially to the interior and Southwestern States.

STOCKING PENNSYLVANIA STREAMS.—Philadelphia, Jan. 23.—Twenty-one hundred California trout were received yesterday by the Pennsylvania State Fish Commissioner Spangler, who has sent them to be distributed in the following streams of this State: Bright's Run, a branch of the Bushkill; Canadensis, a branch of Broadhead's Creek; the Tobyhanna and Tunkhannock, branches of the Lehigh; Octorara and Fishing Creek in Lancaster county, and branches of the Perkiomen in Montgomery county. A number of the fish were also handed over to the Philadelphia Park Commission.—HOMO.

The Kennel.

FIXTURES.

BENCH SHOWS.

Jan. 27, 28, 29 and 30.—Annual Dog Show of the New Brunswick Poultry and Pet Stock Association. Mr. H. W. Wisson, Secretary, St. Johns, N. B.

Feb. 4 to 11, 1885.—New York Fanciers' Club, Third Annual Exhibition of non-sporting dogs, poultry and pigeons at Madison Square Garden, Feb. 4 to 11, 1885. Chas. Harker, Secretary, 62 Cortlandt street.

March 5, 1885.—World's Exposition Dog Show, New Orleans, La. Entries close Feb. 23. L. F. Whitman, Superintendent.

March 18, 19 and 20, 1885.—Second Annual Show of the New Haven Kennel Club. E. S. Porter, Secretary, New Haven, Conn.

April 7 to 10, 1885.—First Annual Dog Show N. E. Kennel Club, Music Hall, Boston. J. A. Nickerson, Secretary, 150A Tremont street.

April 21, 22 and 23.—Annual Dog Show of the St. Louis Gun Club. W. A. Albright, Secretary, St. Louis, Mo.

May 5, 6, 7 and 8, 1885.—Second Annual Dog Show of the Cincinnati Sportsman's Club, Cincinnati, O. W. A. Coster, Superintendent.

May 13, 14 and 15.—Third Annual Dog Show of the Toronto Dog Show Association. W. S. Jackson, Secretary, Toronto, Ont.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1987.**

EASTERN FIELD TRIALS CLUB.

THE annual meeting of the Eastern Field Trials Club, for the election of officers for the ensuing year, was held at the St. James Hotel, New York, last Thursday evening. It was voted to amend the constitution and by-laws, making the Board of Governors to consist of fifteen and that five shall constitute a quorum. The treasurer's report showed that the finances of the club were in a very flourishing condition. Following is a list of officers elected:

President—J. Otto Donner, New York.

Vice-Presidents—B. F. Wilson, Pittsburgh, Pa., and Elliot Smith, New York.

Secretary and Treasurer—Washington A. Coster, Flatbush, L. I.

BOARD OF GOVERNORS.

Dr. H. F. Aten, Brooklyn, N. Y.	G. DeForest Grant, New York
Dr. S. Fleet Speir, Brooklyn, N. Y.	Luther Adams, Boston, Mass.
John G. Heckscher, New York.	C. DuB. Wagstaff, Babylon, N. Y.
H. E. Hamilton, Hackensack, N. J.	D. S. Gregory, Jr., 2d, New York.
R. C. Cornell, New York.	J. W. Orth, Pittsburgh, Pa.
A. E. Godeffroy, Guymard, N. Y.	F. R. Hitchcock, New York.
	Geo. T. Leach, New York.
D. C. Bergundthal, Indianapolis, Ind.	J. E. I. Grainger, New York.

A vote of thanks was tendered the retiring president, Mr. Elliot Smith. The meeting then adjourned.

THE HIGHLAND COLLEY.

PLEASE, Mr. Printer, spell the word colley as I do, as that is the proper way, not collie, which the Saxons almost always pronounce as if spelled "coolee;" that will do to begin with. I am sorry to find that your correspondent, Mr. C. G. Harston, has mistaken me in speaking of the old Highland colley, which is quite a different animal from the Lowland, or black and tan, or black white and tan dog of that name, and I hope to make myself understood, at least I shall try to do so, if Mr. Harston's mind or mental vision is not too obtuse, I think I can hammer my meaning into him. They are not "almost any color except *green*" (the italics are mine), the latter color seems to belong entirely to certain parties who write on and judge these dogs. Now, Mr. Editor, let me tell you and your readers that I do not believe there is one Highland colley in America, and I don't think they have as yet attracted the fancy in the old country to any extent and strange as it may appear, a very able writer on dogs some years back doubted the existence of such a breed until the editor of the *Live Stock Journal*, then published at Ludgate Hill, London, issued an engraving of one of these dogs in his paper. I wish a copy of the *Live Stock* of that date could be forwarded to our editor here and I am sure the publishers of the *Live Stock* will have the warm thanks of many Highlanders.

The pure old Highland colley is an animal possessing an immense heavy and long coat. His coat sometimes is the length of seven or eight inches, and he has long hair hanging over his eyes, similar to the fancy Skye terrier, or to make it more plain to Mr. Harston, he wears his hair like the New York ladies, I hope he can comprehend that. He does not stand so high on the legs as his Lowland brother, and he is shorter and rounder in the barrel. He possesses all the fine qualities of a sheep dog, being naturally docile and sweet tempered, he never "grips" a sheep to hurt it, and will not only prevent his own flock from going astray, but guard them against all danger. The fox that attempts to steal a lamb will never live to repeat the action if this dog gets hold of him. Many a hundred times have I seen one of the breed go into a strange flock and bring out one of his own sheep which had strayed, and it was quite a common thing in my young day to send colley to the mountains alone to fetch home his own flock. Neither frost nor snow has any terrors for him; rather the reverse, for often have I seen him lying in the winter in front of the kitchen door and seeming to enjoy the covering of snowflakes which were falling upon him, and I have known him to discover sheep, under huge wreaths of snow, that would have ultimately perished had it not been for the sagacity of this trusty servant.

Not many years ago I met the shepherds in the service of Mr. Gordon, of Bevaglie, going with sheep to the winterings at the sea coast, and they had two of these dogs with them. I have not seen any of them exhibited in Scotland, but I believe some were at Inverness; if so, any one writing the secretary of the Inverness dog show would, I have no doubt, get a courteous answer. I know, as I have stated in a former

letter in FOREST AND STREAM, "that there is a fair sprinkling of these dogs throughout the Highlands of Scotland, and I think Mr. Gow, the obliging landlord of the McDonald Arms Hotel at Kinnloch Bannoch, in Perthshire, could supply some information on the subject." Now I trust after this that Mr. H. will be able to distinguish between the Highland and the bonny Scotch colley, which is a very taking dog, and has all the good qualities of his neighbor, except that he would not endure such severe hardships and bitter cold. They are not of every color either except "green," but they are of more mixed colors than the Highlander, which is either dark, pepper and salt or brown, sometimes a white blaze on face, or a white belt across the body or ring around the neck, but the "all one" color is considered the best. I thank Mr. H. for his invite to Toronto, but God save the mark, if colleys are judged there as I have seen them elsewhere in America, for certainly what I have seen was bad, I beg to decline going. Now Mr. H., why not compel every judge to produce a certificate of intelligence and capability from the commissioners of lunacy? That would go as far with me and some others as the sapient opinions of dog show committees. When really practical, reliable judges of our various breeds are appointed to act, then you may see a doggie or two on the show benches belonging to A ROVING HIGHLANDER.

ENGLISH KENNEL NOTES.

XXIII.

THE show that will open under the auspices of the Kennel Club, at the Crystal Palace, on Tuesday, will, in point of numbers, be the most important since such gatherings were first instituted. The splendid total of over 1,600 entries bears a twofold explanation. Beyond doubt it expresses the confidence of exhibitors in the Kennel Club's system and officials, and secondly it is in no small degree due to the central position of the show ground and its vicinity to the metropolis. There may be, I would insinuate, a third, and for myself confessedly great inducement, that is the self-explanatory opportunity of doing the round of London gaieties.

I think I have on a former occasion mentioned that the Collie Club marked their disapproval of the judge, a Mr. Byron, selected for their classes by the Kennel Club, by declining to give any extra prizes. This must have been the act of a committee and I am disposed to give it my approbation on the ground that they being specialists are therefore the best authorities of a judge's capacity, and if in their opinion Mr. Byron did not possess the knowledge that would enable him to properly award the prizes to such an important class, then they were doing a duty so simple that it stared them in the face.

The natural, however regretable, sequence to this act would have been a falling off in the collie entries, but this is far from being the case, as Mr. Byron has obtained the extraordinary entry of two hundred and beaten the record. Fox-terriers usually reach the highest numbers, but the collies this time beat them by about twenty entries.

I suspect the apparent inconsistency of the large entry can be accounted for in the presumption that many of the exhibitors do not trouble themselves with the doings of the subsidiary clubs, that those who do not read the papers know nothing for or against Mr. Byron—a fresh man has always a better chance than one who has already tried and blundered—and then there is a large proportion of the fancy who would have a shot at the fat prizes even under the most unlikely and shallow-minded judge, say Mr. Fred. Gresham, for instance, or any other such "one-breed man."

This incident contains many points of interest to the supporters of specialist clubs. It should be their ambition to make their influence so extensive, that when the Kennel Club proceed to elect the judges they should put themselves into communication with the specialist clubs, who, if forgetful of their own incorcate, are ever thoughtful for the breed they are united to support.

I would go much further and make a proposal that I will do the Kennel Club the honor of believing they would accept, that is for the honorary secretaries of all the specialist clubs to immediately, on appearance of the schedules, forward a list of their selected judges, from wich the Kennel Club could make their choice. It is manifest that such a plan must be beneficial to both parties. It is only open to the suspicion that it might be in time employed to further the ends of a clique. I do not fear such an event, as the members choose their mouthpiece when they elect the committee, and it would be too grave a scandal to escape the wary notice of the doggy "chiels amang us takin' notes." I apologize for that mouldy quotation, but it ran out of my pen.

The Great Dane entry of sixty dogs was as unexpected as it is gratifying to their club's zealous honorary secretary, the Rev. Gambier Bolton. Again I repeat that the secretary is the club. A specialist club will rise to pre-eminence under the sedulous labors of an active, juvenant secretary, and as easily lose vertebral power under a somnolent, laissez-faire official.

I wonder if Mr. Stephen, the Kennel Club secretary and manager of the Crystal Palace show, has had the curiosity to measure the distance from bench to bench in the galleries. The show is held at one end of the Palace and forms a horse-shoe in the gallery. Were I an exhibitor in both classes, collies and St. Bernards, which are usually benched at the two ends of the shoe, I think I should put myself in training for the event.

The long doggy correspondence in our *Daily Telegraph* on "Reason and Instinct," concluded with an hilariously witty letter from a funny dog, who signed himself "Ponto," from Barking. "Ponto" appears to be not unnaturally desirous of showing us how our dogs see us, and in the course of his observations solemnly relates a few acts of human intelligence that have come under his own notice. He says: "I once had in my possession an old lady who used to accompany me in my walks. She was in the regular habit of giving a certain crossing-sweeper a penny on Monday mornings. One day she went out without her purse, but on the following Monday she gave him twopence, recognizing from the force of habit, or instinct, or whatever you like to call it, the omission of the previous week. On another occasion I lost her in the neighborhood of Campden Hill, and though I searched up and down the streets in every direction, was unable to recover her. Returning home, what was my pleasure and surprise to find her sitting in the drawing-room. She received me with every demonstration of delight. Now how did she get home? Was it reason or instinct?"

"No man is a hero to his own valet," says the proverb. What are we to our dogs after this?

It has long been a pet theory of mine that the intelligence of a dog is not wholly unconnected with the mental caliber of his master. This I will avow, that stupid men have always stupid dogs. This is not such a ridiculous speculation as it may appear at first sight. My dog is my constant companion, in-doors and out we are together; if I am pleased his countenance mirrors my content, and his tail wags approval, so our feelings are alike; fasting or feasting we are together, I eat the meat he has the bone, thus our tastes are similar, and so on, *ad absurdum*. In this manner we might arrive at the conclusion that the dog's mind would become the reflex of his master's, and there be only the difference of speech between them—and er, *vice versa*, Ponto, perhaps, eh? So, for instance, suppose you know, we saw an advertisement from the reporter of the *Live Stock Journal* or one of his friends: "Wanted, an intelligent companion dog," we should know what they mean; ha! ha! Ponto, I am glad to make your acquaintance, give me your paw, what will you take, plain water or with a drop of Condy's fluid in it?

I remember to have heard some time ago when I was up in town that the *St. Stephen's Review* had changed hands, and that I believe it was Mr. Shirley who told me in the club the new editor was an ex-doggy man, Mr. Wm. Allison, barrister at law. The present generation of fanciers has almost forgotten his tall slight frame in the judging ring. But among us older fogies are preserved pleasant recollections of the witty and vivacious writings pregnant with sound sense and reasoning that too seldom appeared from the pen of Jester's owner. I look upon Mr. Allison and Mr. Russell Earp (the first honorary secretary of the Fox-terrier Club) as the creators of the modern type of fox-terrier.

That the doggy man's pen has not lost its cunning, and that the editor's "fancy" is as "free" as of yore is proved by the sparkling pages of his present hobby, the conservative social organ.

I am in receipt of a letter from an American mastiff breeder who desires me to enucleate the mystery of Crown Prince's paternity. Thank you, sir, one at a time; I have not yet found out "who's Griffiths." I am afraid that this august question is doomed to be added to the late Lord Dundreary's stock of "things that no fellah can understand." I confess I have read the correspondence and I affirm that the language is so plain and the assertions so flat that I am undecided which party to disbelieve. The Old English Mastiff Club seems to have the best of it for invective, and I must admit that their exuberant language is too heavy for their facts. Mr. Dalziel is equally forcible but hardly so ornate.

There is a tale told of a famous painter whose opinion had been importuned by a vainglorious amateur on the latter's pictures. After a careful and prolonged inspection the celebrity bade his young friend "Adieu" and confessed that "you beat me in frames!"

Hither again, friend Bunsby, and explain the application of the above.

It seems to be admitted that the secretary of the club did, at the meeting, ask Mr. Corsincon Dalziel if he "purposed swindling Mrs. Robinson." That may be considered purely ornamental, which Mr. Dalziel can afford to yield if he has the facts. It is now stated that a letter from Mr. Cook exists, in which he says he "believes the Shah was the sire of Crown Prince, and that nothing would change his belief," but I must tack about, for my brain is beginning to whirl.

The *Kennel Gazette* for January publishes a new list of associates; of some sixty names there are only two who have ever been heard of before.

Next Thursday will be sold at Aldridge's, in London, a large draft from Mr. Harding Cox's kennel. Among those that will come to the hammer are several well-known wire-haired fox-terriers and wavy-coated retrievers. This sale by no means signifies Mr. Cox's retirement from breeding or exhibiting. The part proprietor of the *Field* takes too great an interest in dogs to think of altogether giving them up. The notification of such a step would be received with regret by the many friends his good parts and good nature have gained him. "Little Pitchers" have long ears, though it is long since either their corn or chaff was seen in the *Country*.

In addition to the remarks I made upon the Stephen and Wyndham Carter affair, it seems to be "good form" to affect utter indifference to the latter's insults. The persons attacked are, I understand, of opinion that they can afford to ignore his acts and deeds. I have spoken to friends of Mr. W. Carter, who are reluctant to think ill of him, and still hope that he will one day realize the folly of his present reckless and unworthy conduct. LILLIBULERO.

JAN. 10, 1885.

NOTES FROM NEW ORLEANS.

Editor Forest and Stream:

I am enabled at last to give your readers some definite information in regard to the New Orleans bench show. At one time it seemed as if the affair would have to be abandoned entirely, owing to the untimely death of our old friend, Chas. Lincoln, and the inability of his executors to decide on a proper and fit person to take charge of the affair and make a success of it. With rare good judgment they have at last appointed a gentleman who, in the opinion of your correspondent, will come as near filling Mr. Lincoln's place as it was possible to find. I have had the pleasure of meeting Mr. L. F. Whitman, of Chicago, who in connection with his advantages of having practical experience at bench shows, combines the energy and push of the typical Chicagoan, and all the proper business qualifications necessary to command success. I found him this A. M. at his desk at No. 53 St. Charles street, busily engaged in answering letters, forwarding entry blanks, and dispensing all the information in his power to his numerous correspondents and visitors.

The date set for the opening is Wednesday, March 5, and entries will close on Feb. 23. In addition to the regular list of cash prizes an unprecedented quantity of special prizes have been and are daily being given. As an instance, while I was conversing with Mr. Whitman a well-known sportsman of this place stepped up and asked his acceptance of a silver cup as a special prize in the Irish setter class. Mr. W. assured me that this was the third instance of this kind that had occurred in the past twenty-four hours.

Although the date has been fixed after our carnival week, this fact need not be construed into a disappointment, for we have the big exposition going on, and besides, the 4th of March is the anniversary of the New Orleans Fire Department, and that day is always celebrated in a manner peculiar to New Orleans, and is well worth a visit from New York to witness.

Speaking of dogs reminds me of shooting. Happening to pass down St. Charles street a day or two since, I was hailed by that prince of good fellows, Leon Marthe, of No. 19 St. Charles, who called me in and wanted to show me the prospective headquarters of the visiting sportsmen who are to attend the Ligowsky Clay-Pigeon Tournament next month. Although Leon does not claim to know a shotgun from a gatling, he certainly understands the needs of a sportsman, and every detail necessary to their comfort has been provided in these superb quarters. Visitors will feel as if they are entering their private clubroom, and "I speak by the card" when I say that the lunch my friend Leon serves up when you lay down your money is ruinous to boarding houses and causes one to propound the mental conundrum: "How can he do it?" Leon does not force his hospitality on his visitors, as the sportsmen's room is separate from the bar-room. The agent of the Ligowsky Clay-Pigeon Company has not put in an appearance yet, but your readers can rest assured that the tournament will be a success. The various professional matches do not and never will command the countenance and support of our local sportsmen, and anything like hippodroming for the purpose of acquiring cheap notoriety, has always proven a failure here.

The favorite pastime among the shooting fraternity here is bat shooting, both on account of its cheapness and the skill requisite to bring the bat to grass. Like our weather, bat-shooting is very uncertain, and the expert is frequently the victim of the novice. I have just seen the agent of a new shotgun, who is making an exhibit of their goods at the ex position. He informs me that it is his intention of giving a practical illustration of the working of the new shotgun at an early date, by putting up one of the guns as a prize to be shot for. The conditions of the match are that six live bats are to be thrown by hand at one time—that is all turned loose at once—and each shooter is to fire six times at them with the prize gun. The match will undoubtedly prove a hit and bring out a large number of shooters, thus subjecting the gun to a severe test.

I notice in our morning papers that the various railroad companies intend reducing their fares very materially from the present rates to visitors to the exposition. Should any of your readers have an idea that board is high and scarce to get down here, just let him insert a 25-cent advertisement in one of the papers for room and board, and he will quickly have all such ideas dissipated. We are all justly complaining of the miserable weather vouchsafed us for the past two weeks, but console ourselves with the reflection that you all are not much better off up your way. More anon. FOXHORN.

NEW ORLEANS, January 23, 1885.

POINTER BREEDING.

Editor Forest and Stream:

"Saxon's" letter in your issue of the 10th inst., is the most remarkable production that has ever come under my notice. Prejudice is the reason of fools. If a man allows himself to be blinded by it to such an extent as to cause him to ignore the truth, he should at least be careful not to contradict himself half a dozen times over in one short letter.

"Saxon" must be joking when he appeals for "fair play" to one who, well nigh single-handed, has fought his way against innumerable odds, and through the worst elements of our army of dog ignorance. Come, old man, try again! That's going a wee bit too far. How would it look if the commander of the thousands of troops that surround General Stewart and his handful of men in the Soudan were to hand in a request for "fair play?" Somebody might admire his cheek, but the public would laugh at his folly.

Let us now direct the dissecting knife toward "Saxon's" "careful study," for that is what he tells us it is. "Several years ago Mr. Mason came to this country, bringing with him a number of dogs, among them several pointers; at least he said they were pointers." "Saxon" clearly insinuates the dogs were not pointers, and continues "The great field-trial champion, Chancellor, was one of them, if I remember rightly. After attending several bench shows, and having a walk-over for the honors with his invincibles, Mr. Mason became tired of such easy victories and longed for new worlds to conquer." How does "Saxon" reconcile his insinuation that the dogs were not pointers, with his statement that they were invincibles and had a walk-over for the honors? A little further on "Saxon" writes, "his (my) wild and intemperate denunciations of men and dogs that have incurred his displeasure, but gain him the ill will and contempt of thousands of sportsmen." How, in the name of common sense, does "Saxon" reconcile such a statement with the insinuation that my dogs were not pointers, and that they had a walk-over for the prizes? "Saxon" (not I) denounces Americans and their dogs, when he informs us that my mongrels beat the good American dogs, and that American judges were such a lot of noodles they couldn't distinguish between good-looking dogs and mongrels. When have I, Mr. Editor, ever written of American sportsmen or their dogs in any such terms? Never. "American sportsmen," says "Saxon," "love a good dog." The evidence is certainly not to be found in "Saxon's" acknowledgment that they loved my mongrels. This man is too much for me, Mr. Editor, I have turned his letter upside down and tried to read it in that way, I have also tried to read it like Hebrew, but whichever way I look at it, it beats me to make either head, tail or common sense of it. "The great field trial champion Chancellor was one of them." I now summon "Saxon" to produce evidence in support of his insinuation that I represented Chancellor a field trial winner. The dog had no field trial record whatever, and the man does not live who is able to produce one grain of evidence to show that I ever said he had. He won about thirty first prizes, and was exhibited twice in this country, winning on each occasion. Come, "Saxon," no Chicago business, I demand evidence, and that, too, without any dodging. Your *nom de plume* won't shield you, if without being able to furnish evidence, you write anything reflecting on a man's reputation or his character.

In the face of this deliberate concoction "Saxon" coolly says, "Mr. Mason should be fair in his statements." Then he proceeds as follows: "He (myself) first told us how ignorant we are; could not find a single man in America besides himself that knew a pointer when he saw one." Will "Saxon" inform us when and where I have so written or said anything of the kind? It is not in his power to do it; how then, in the face of such a falsehood, does he expect anybody to believe that he is one of the thousands of sportsmen who love a good dog, but who "love fair play more."

Now for *la crême de la crême*. I told Americans, says this foolish "Saxon," "the dogs we had imported were nothing but scrubs and mongrels and unfit to breed to." A little lower down he credits me with saying, "Faust, Bow and Keswick were pointers par excellance." Everybody knows these dogs were imported. Perhaps "Saxon" can explain the consistency of the two statements; I cannot. Has the individual's prejudice blinded him completely, or is he bereft of his reason? "Saxon" acknowledges that in my critique on the pointers at the New York show I wrote, "Jilt was the best bitch in the show." How does he reconcile my having written thus with his statement that "Mr. Mason should be fair in his statements," etc. What did the FOREST AND STREAM say of Jilt? Here it is: "In the bitch class first went to Jilt, who was perhaps deserving, although we liked Belle and Joy, both he., fully as well." Mine was the only report that said Jilt was the best bitch in the show. How then can "Saxon" insinuate that I am prejudiced against Mr. Godeffroy or his dog? I write of dogs, not their owners, and I write in the interest of the public. Neither Mr. Godeffroy nor "Saxon" can influence an opinion of mine—never did and never will. I advised owners of pointers not to breed to Croxteth, and I do so again. The reason why I could not consistently advise anybody to use him in the stud is because he has a slack back, a weak loin, a shallow chest and faulty feet, added to which he has a coarse, badly-carried tail, and begets light-eyed puppies. I would not breed to any dog that was faulty in back, loin, chest and feet. Such faulty conformation should be bred "from" not "to." Slack backs, weak loins and splay feet are difficult to breed "out." Why then endeavor to perpetuate them? They are structural faults that are easily transmitted, and whatever importance American breeders attach to them, we give them a very wide berth. Croxtoth almost invariably stamps his structural faults on his get, and my opinion of him in 1881, which was publicly expressed in 1883, has been indorsed conclusively. He has been in the public stud about six years, and up to the present time he has not sired *one* acknowledged good-looking dog. I don't say a first-class dog, but I challenge his numerous admirers to name and produce a good-looking dog by him. So far he is the sire of two good-looking bitches, Jilt and Lady Croxteth. But is "Saxon" aware that neither of these bitches is first-rate? Put Jilt or Lady Croxteth alongside my old bitch Lady Isabel (first, Birmiugham, 1876; championship, Birmingham, 1877;) or Mr. Lloyd Price's Bow Bells, and you would see what was wanting. With the exception that Bow Bells is throaty, she is near perfection, whereas both Jilt and Lady Croxteth are slack in the back, a fault of itself sufficient to prevent their ever beating first-rate specimens. Somebody will ask me if I mean to say that there was not a first-class pointer bitch on exhibition at the New York show of last spring. It is best to be frank, and I say that there was not. My old bitch, Water Lily, has never been beaten since she came to this country, four years ago, and she is acknowledged to be one of the best large-size bitches in America. Why, "Saxon," when I exhibited Water Lily at Birmingham under the judgeship of three as good men as ever went into a ring, what did she do? She took a commended card, there being seven others ahead of her, and if "Saxon" will refer to my report on the show, he will find I said she got all she deserved. I do not know of any big bitches in this country that can beat her to-day. What does all this prove? Certainly not that I am a false prophet, but that what I told your readers in my first letter to this paper (Aug. 16, 1883) was the truth, "There is, therefore, much to be done; much

that cannot be done by bragging, but which may be overcome by perseverance." "Saxon" and some others whom I could mention, cannot breed better-looking pointers than Water Lily, and yet they try to show that their theory is right and mine wrong.

"Saxon" refers to my critique on the pointers at the New York show last spring, with a view to proving that I am a false prophet, and that Croxteth is a great stock dog. What does reference to the critique show? Why, that all Croxteth's get inherit his structural faults, and that my opinion of him has been indorsed in a most substantial manner. Let us appeal to the report itself, at least so far as it relates to Croxteth's get. FOREST AND STREAM, May 22, 1884: "Drake (Croxteth—Lass), placed second, was not entitled to the honor. * * * Drake has a slack back, bad loin and faulty feet, which are failings I cannot tolerate in a pointer, or indeed, in any sporting dog." Now for No. 2: "Scout, also by Croxteth, is faulty in back, loin and feet, besides being plain in face." No. 3: "I never have seen pointer classes handled so badly as were the next two for small size dogs and bitches. Had the judge been asked to select the worst dog in the class, he could not have succeeded better than when he placed Pride (Croxteth—Royal Fan) first. He was absolutely the worst dog in the class, and should not have been noticed. He is wide in front, has crooked forelegs, with feet twisted out (as seen in the dachshund), splay feet, a weak back, and bad loins * * * The best dog in the class was Heath's Dash, a nice lemon and white of good quality. He was not even commended." The FOREST AND STREAM report, which appeared May 15, said: "The open dog class was not well handled. Pride, who won first, was in capital condition, which is about all that can be said in his favor."

In order to convince "Saxon" that I am not after all such a false prophet, I will remind him that Dash, not worth a commended card under Mr. Sterling's judgment, won first prize at the National Breeder's show (in a much better class), when adjudicated upon by a better judge, Mr. Davidson. Now for No. 4. "Vision (Croxteth—Vinnie), though by no means a bad bitch, did not deserve second prize, which was clearly won by Belle (Gregory's). Though Vision has a fair good head, neck, legs and feet, her loin is bad, as is also her tail and the carriage of her ears." No. 5. "In the bitch class, the Neversink Lodge Kennels' Jilt (Croxteth—Lass) won, and was properly placed at the head of affairs. I cheerfully admit that I never expected to see Croxteth sire so good a bitch. She is a trifle fine in muzzle and inclined to be throaty for one so young. She is also too wide in front and a trifle slack behind the shoulders, nevertheless she is a good one, and had I been judge she would have won the special for best pointer bitch in the show, as the winner, Vanity, cannot compare with her."

Now, Mr. "Saxon," you see why it is not wise to breed to a dog of Croxteth's faulty conformation. When we take into consideration the opportunities he has had, his record is anything but brilliant. He is the sire of two good-looking bitches, the best of which is not first-rate, as will be gathered from my criticism of her. It is a notable fact that Jilt, Lady Croxteth and Drake are all from the same litter and this is further evidence that very few bitches nick well with Croxteth. One of the litter is fearfully defective in back, loin and feet, whereas the other two are faulty in back. "Saxon" seems to be ignorant of the fact that every dog has a dam as well as a sire, and while not wishing to deprive Croxteth of one grain of credit due him, as the sire of the Lass litter, I ask if it would be unfair to allow the bitch some credit also, and especially so when we bear in mind how few bitches bred to Croxteth ever produce good-looking stock. Perhaps when Lady Croxteth and Jilt have puppies somebody will wonder how it is that they are not so good looking as their dam, and perhaps those who look for the characteristics of sire and dam, will find in their stead the structural faults of the grandsire. Croxteth's faulty conformation cannot be bred out at one cross, nor two either, and the day will come when these few lines will be recalled to the memory of many an owner of pointers.

If a dog has a fair good field record, people at once proceed to breed every type of bitch under the sun to him. This is a mistake, it is a blunder that will make itself felt when it may be too late to correct it. A slack-backed dog, or a bad-loined dog, or a splay-footed dog, may put in brilliant work at a field trial, but if endurance were the test, how would such animals acquit themselves? How many race horses that are wanting in bone and substance, and even faulty in the back and at other points, can gallop and gallop fast for a quarter of a mile or so? There are hundreds of them. Examine them well, and then look at such as Mr. Gretton's Isonomy. He could gallop for a week, and would be going strong and well while the others were being carried into the stable. You would breed to such a horse, and pay the one hundred guineas stud fee sooner than you would pay twenty-five guineas for the services of a "quarter mile flyer." Why?

It is said the owner of Don once came very near giving him up as a bad case. In less persevering hands the dog would, in all probability, never have been heard of, whereas he now takes rank among the best field dogs of the day. Who would have bred to him if he had been beaten in his first heat and after that retired? Who would have stopped to think that, as he comes of a rare working strain, and of a good-looking strain in the bargain, he might, if bred to suitable bitches, get better looking stock than himself? Nobody. He would have been a dead letter in the history of dogs. I would sooner breed to Don ten thousand times over than to Croxteth, although I know he is not a show dog. Why? Because his structural faults are such that can be easier bred out than Croxteth's, and he possesses many of the most important requisites to be looked for in a field dog, viz., good back, good loin, excellent legs and feet, plenty of bone and substance, besides which he comes of a family known to be both good and good-looking. His worst fault is coarseness or lack of quality. How much easier to get quality through the dam than to breed out such everlasting faults as slack backs, weak loins, splay feet, and shallow chests. Why, "Saxon," we have been striving for years to breed away from such faulty conformation, and because I, for one, refuse to turn back and encourage its wholesale production, some generous critic accuses me of denouncing "men and dogs that have incurred my displeasure." I do not ask "Saxon" and his friends to turn from the road they are on. In the most friendly manner I gave them timely warning. If a man throws himself into the water, what is the use of pulling him out until he has been in long enough to teach him better than go there again?

Have I advised "Saxon" and his friends to breed to Beaufort since that dog became my property? I think not. It is sufficient for me to know that my opinion of the dog as expressed in FOREST AND STREAM twelve months before I purchased him has been indorsed by every competent judge who has seen him. What I then wrote is a clear denial of "Saxon's" statement that I said the dogs imported into this country were scrubs. Here it is. FOREST AND STREAM, Aug. 16, 1883: "There are many good-looking dogs here, but few are ever produced equal to the imported stock, and this fact supports me in what I stated before I had been here many months, that good pointers cannot be produced unless people go to work very differently from what they are doing. No judgment seems to be used, and bitches are bred from at random to the most unsuitable sires. There is no denying this, and yet America can boast of having bred Beaufort, who is in my opinion, the best pointer living that I have seen." The dog now stands in the stud as the best pointer dog living. If "Saxon" can find one to beat him why don't he say so and let us come to business. My offer to show him for any reasonable sum against any other dog, is still open.

"Saxon" asks for evidence that Beaufort is a great stud dog. Here it is. The dog has been in the stud one year only. He sired the first, second, vhc. and hc. winners in one class at Washington, 1884. One of the papers said the class was the best ever seen in America. He sired the winning bitch and the winning puppies at the same show, also the first prize puppy at New Haven, and the first prize winner at New York, 1884. Mr. Littlejohn, I know, has refused $500 for a son of his, Fritz, who, by the way, is probably the best lemon and white pointer dog in America. Compare the FOREST AND STREAM'S critique on this dog with what the paper said of Croxteth's get. "We greatly admired Fritz, who won first. He is very good all over, with no striking faults, and does great credit to his sire, Beaufort." Tell me, "Saxon," where the dog is by Croxteth that would stand a ghost of a chance of success alongside of Fritz.

"Saxon" was joking when he said that not one of Beaufort's get has been considered good enough to start in a field trial. A very fair statement to make about a dog that has only been in the stud twelve months. How many of Croxteth's get had run in a trial twelve months after Mr. Macdona landed with him in America? Try again, "Saxon." Unfortunately I do not own any of Beaufort's get that are old enough to compete against Croxteth's; but I know where to find them, and if the owners make no objection, I will show two young dogs by him against anything "Saxon" can produce, either for money or a handsome piece of plate, $100 forfeit. Conditions—Men of honor and experience to be the judges. I am willing to leave the selection in the hands of the FOREST AND STREAM, or I shall be glad to entertain any reasonable proposal "Saxon" may wish to make. Inclosed please find my check for $100. CHARLES H. MASON.

NEW YORK, Jan. 26, 1885.

ELLIOT SMITH.

NEW YORK, Jan. 24.

A FOX-TERRIER CLUB.—*Editor Forest and Stream:* An attempt will be again made during the coming fanciers' show to organize an American fox-terrier club. The secretary of the fanciers' show, Mr. Chas. R. Harker, has with great courtesy offered every assistance should the effort come to aught. I have written personally to most of our fox-terrier men asking them to be present on the 10th prox., at Madison Square Garden, and that Mr. Harker has promised to give us every accommodation to facilitate the meeting. Now that this breed has become such a feature at our shows, it is very desirable that a standard be accepted to judge them. Looking through the exhibits at any large show in this country, you will find many prizes winners of different types.—EDWARD KELLY.

DOGS FOUND.—A correspondent writes that he knows the whereabouts of a red Irish setter that was advertised a few weeks ago, but has forgotten the owner's address. A reward of $25, and subsequently of $50, was offered. Our correspondent does not wish the reward, but will give the owner information regarding the dog if he will communicate with him through FOREST AND STREAM.

A black and white setter dog, near Newark, N. J. The owner can have same by addressing "16-Bore," care FOREST AND STREAM office, city.

THE NEW YORK FANCIERS' CLUB'S SHOW.—The managers of the New York Fanciers' Club's show, to be held at Madison Square Garden Feb. 4 to 11 have added classes for fox-terriers to the list which was published in FOREST AND STREAM, Jan. 15. The prizes are: Dogs, $10, $5, and certificate; bitches the same; puppies, $8, $4, and certificate. There will also be a special cash prize for the best litter of puppies under six months old. Entries close Jan. 31. Chas. R. Harker, Secretary, 62 Cortlandt street, New York.

RULE 12.—*Editor Forest and Stream:* I have read with much interest in your issue of to-day the correspondence between Messrs. Mason and Cornell. Doubtless the former gentleman thinks that the two letters as published are complete in themselves. They are. But had he desired to enter further into controversy with the W. K. C., he might have made to Mr. Cornell's curt reply the yet more curt rejoinder that in law fraud vitiates all rules—even Rule 12 of the W. K. C.—MEAT-HAWK (Jan. 22).

KNICKERBOCKER KENNEL CLUB.—Jersey City, N. J., Jan. 26, 1885.—*Editor Forest and Stream:* At the annual meeting of the Knickerbocker Kennel Club, held Jan. 16, 1885, the following officers were elected for the ensuing year: President, R. T. Greene; Vice-President, G. W. Waite; Corresponding Secretary, Geo. L. Wilms; Recording Secretary, L. F. Brigham; Treasurer, Wm. Hepsley; Executive Committee, M. Mills, Geo. H. Piercey and Geo. L. Wilms.—G. L. W.

MAX WENZEL'S CHIEF MISSING.—We have received a note from Mr. Max Wenzel stating that his red Irish setter dog Chief has strayed away. Anyone knowing of his whereabouts will confer a favor by communicating with Mr. Wenzel, whose address is Hoboken, N. J.

FOWLER, the Moodus, Conn., chap who once swindled so many men out of money for mythical dogs, has gone into the quack medicine stamp swindling business.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, or breeding or of death
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Satire. By J. S. Gwathmey, Brooklyn, N. Y., for liver pointer dog, whelped April 18, 1884 (champion Knickerbocker, A.K.R. 19—Peg Peg, A.K.R. 920).

Fairy Glen. By E. W. Jester, St. George's, Del., for blue belton English setter bitch, whelped Nov. 22, 1884, by his Glen Rock (A.K.R. 1616) out of Blue Belle (A.K.R. 99).

Count Fosco. By Chas. E. Taylor, Bath, Me., for black and white English setter dog, whelped June 10, 1884, by Dash III. out of Donna (Druid—Dryad).

Dr. Hersey, Honest Dave, Edgewood, Overman, Backman and Kitty Wells. By Eugene A. Austin, Providence, R. I., for English setters, five dogs and one bitch, whelped Nov. 18, 1884, by Cash Boy (Cashier—Flake) out of Katydid II. (Dash III.—Katydid).

Count Paris II. and Paris Boy. By J. S. Bailey, Boston, Mass., for black, white and tan English setter dogs, whelped Aug. 1, 1884, by Count Paris (Royal Blue—Modjeska) out of Daisy Starlight (Lelaps—Starlight).

Glen Onoko. By the Knickerbocker Kennel Club, Jersey City, N. J., for red Irish setter bitch, whelped Nov. 1, 1884, by champion Glencho out of Ruby S. (A.K.R. 512).

Count Knick and Mamie G. By the Knickerbocker Kennel Club, Jersey City, N. J., for lemon and white pointers, dog and bitch, whelped Oct. 2, 1884, by champion Knickerbocker (A.K.R. 19) out of Lady Mabel (A.K.R. 461).

Romie S. By Charles R. Squire, Troy, N. Y., for red Irish setter dog, whelped Nov. 1, 1884, by champion Glencho out of Ruby S. (A.K.R. 512).

Emeline B. By Charles R. Squire, Troy, N. Y., for red Irish setter bitch, whelped Nov. 1, 1884, by champion Glencho out of Colleen Bawn (A.K.R. 507).

Klopstock. Krön and Kleine. By C. F. Tufts, Lancaster, Mass., for rough-coated St. Bernards, two dogs and one bitch, whelped Nov. 19, 1884, by champion Hermit (A.K.R. 23) out of Bruner (A.K.R. 706).

Highland Dick. By H. F. Amsden, Boston, Mass., for black, with white on breast, English setter dog, whelped Feb. 19, 1880, by Pratt's Trim (Duke—St. Kilda) out of Smut (Pete—Queen Bess).

BRED.

☞ *See instructions at head of this column.*

Wanda—Tom. The Sans Souci Kennels' (Philadelphia, Pa.) collie bitch Wanda (A.K.R. 1924) to their Tom, Jan. 14.

Gipsy—Ober. Herbert Flint's (Haverhill, Mass.) cocker spaniel bitch Gipsy to the Cummings Cocker Spaniel Kennels' Ober (A.K.R. 855).

Beauty—Napoleon. The City View Kennels' (New Haven, Conn.) pug bitch Beauty (A.K.R. 1360) to their Napoleon, Jan. 5.

Me-Dina—Lava Rock. The Diamond State Kennels' (St. George's, Del.) English setter bitch Me-Dina (A.K.R. 824) to their Lava Rock (A.K.R. 269), Jan. 22.

Nettle—Mixture. W. H. Cookson's (Hudson, N. Y.) fox-terrier bitch Nettle (A.K.R. 1704) to John E. Thayer's Mixture (Spice—Fairy III.), Dec. 17, 1884.

Eria—Rush. Frank Rivers's (Bridgeport, Conn.) pointer bitch Eria (Rake II.—Browny) to E. Orgill's champion Rush (A.K.R. 357), Nov. 24, 1884.

Lucid—Emperor Fred. H. Hedeman's (Brooklyn, N. Y.) English setter bitch Lucid (A.K.R. 176) to E. A. Herzberg's Emperor Fred (A.K.R. 33), Jan. 8.

Birdie—Knickerbocker. Fred Smith's (Jersey City, N. J.) pointer bitch Birdie (Stocking—Lady Mab) to champion Knickerbocker (A.K.R. 19), Jan. 21.

Nun—Hermit. The Chequasset Kennels' (Lancaster, Mass.) St. Bernard bitch Nun (A.K.R. 24) to their champion Hermit (A.K.R. 23), Jan. 16.

Topsy—Young Toby. Mr. Whiteside's (West Boylston, Mass.) pug bitch Topsy to Chequasset Kennels' Young Toby (A.K.R. 473), Jan. 11.

Belle—President. L. G. Dickinson's bull-terrier bitch Belle to E. S. Porter's President (A.K.R. 1208), Jan. 4.

Onyx—Keno. John Clary & Sons' (Worcester, Mass.) mastiff bitch Onyx (A.K.R. 1769) to their Keno (A.K.R. 1766), Dec. 2, 1884.

WHELPS.

Teaser. Pug dog (A.K.R. 1097), by City View Kennels, New Haven, Conn., to J. Kleiner, same place.

Leone. Greyhound bitch, age and pedigree not given, by City View Kennels, New Haven, Conn., to John A. Doolittle, same place.

Nelson II. Black and tan collie dog (A.K.R. 1750), by A. R. Kyle, Grace Point, Mich., to Sans Souci Kennels, Philadelphia, Pa.

Lorraine. Smooth-coated St. Bernard bitch, whelped July 29, 1884 (Cæsar, A.K.R. 22—Daphne II., A.K.R. 489), by Millbrook Kennels, New York, to Dr. W. S. Webb, same place.

Bruno—Elsa whelps. Smooth-coated St. Bernard dog and bitch, age not given, by the Millbrook Kennels, New York, to W. S. Haviland, Brooklyn, N. Y.

Lava Rock. Imported English setter dog (A.K.R. 269), by the Diamond State Kennels, St. George's, Del., to E. W. Jester, same place.

Satire. Liver pointer dog, whelped April 18, 1884 (Knickerbocker—Peg Peg), by H. C. Miller, Hudson, N. Y., to J. S. Gwathmey, Brooklyn, N. Y.

Lucid. Blue belton English setter bitch (A.K.R. 176), by E. A. Herzberg, Brooklyn, N. Y., to H. Hideman, same place.

Bessie. Black, white and tan setter bitch, whelped May 4, 1884 (Dick—Daisy), by E. C. Alden, Dedham, Mass., to H. E. Twombley, Boston, Mass.

Blue Belle. Blue belton English setter bitch (A.K.R. 99), by E. W. Jester, St. George's, Del., to Pierre Lorillard, New York.

Glen Rock (A.K.R. 1616)—Blue Belle whelps. One blue belton and two lemon belton English setter bitches, whelped Nov. 22, 1884, by E. W. Jester, St. George's, Del., to Pierre Lorillard, New York.

Dashwood. Blue belton English setter dog, whelped June 10, 1884 (Dash III.—Donna), by E. W. Jester, St. George's, Del., to George F. Clark, same place.

Glen Onoko. Red Irish setter bitch, whelped Nov. 1, 1884 (Glencho—Ruby S.), by Chas R. Squire, Troy, N. Y., to the Knickerbocker Kennel Club, Jersey City, N. J.

Knickerbocker—Lady Isabel whelps. Lemon and white pointer bitches, whelped Nov. 2, 1884, by the Knickerbocker Kennel Club, Jersey City, N. J., one to Charles R. Squire, Troy, N. Y., and one to Geo. Waite, Elizabeth, N. J.

Bobolink. Black, white and tan English setter dog (A.K.R. 1167), by E. W. Jester, St. George's, Del., to A. Scherer, Fountain City, Wis.

Klopstock, Krön and Kleine. Rough coated St. Bernards, two dogs and one bitch, whelped Nov. 10, 1884 (Hermit—Brenner), by C. F. Tufts, Lancaster, Mass., to Chequasset Kennels, same place.

Ivry. Smooth-coated St. Bernard, age not given (Cæsar—Brunhild), by Chequasset Kennels, Lancaster, Mass., to J. G. B. Smith, Worcester, Mass.

Knight. Smooth-coated St. Bernard, age not given (Mentor II.—Brunhild), by Chequasset Kennels, Lancaster, Mass., to F. W. Webb, Baltimore, Md.

Sovereign. Rough-coated St. Bernard dog (A.K.R. 799), by Chequasset Kennels, Lancaster, Mass., to John Henry, New Orleans, La.

Teaser. Pug dog (A.K.R. 1937), by City View Kennels, New Haven, Conn., to J. Kleiner, same place.

WORMS IN DOGS.—One dose a cure. "Rhiwlas, Bala, North Wales, Sept. 21, 1874. I gave a Naldire's Powder to a collie on Saturday last, and in ten minutes he evacuated a tapeworm 30 yards 2 feet in length. I consider the powder effectual.—R. LLOYD PRICE." *Naldire's Worm Powders*, the great British remedy, are sold by McKesson & Robbins, 91 Fulton street, New York. Price $1.00. Manufacturers: Wright & Holdsworth, 3 Spur street, London, England.—*Adv.*

PUBLISHER'S DEPARTMENT.

AN ACCEPTED FACT.—It is well known that Humphreys' admirable homeopathic remedies have been used extensively, not only in this country, but abroad, and with the most gratifying results. And it is also well known that nine-tenths of all diseases may be cured promptly if proper means are at hand, or applied at once. Humphreys' list of homeopathic specifics contains remedies adapted to any morbid condition which it is proper for the family to treat; and especially for all those diseases whose attack is sudden, and where prompt aid is demanded. Also for those delicate ailments which it may be unpleasant to disclose to a strange physician, and yet a freedom from which contributes so much to the happiness of life. The great feature of Dr. Humphreys' system is that in the administration of medicines prepared by a skillful physician who has devoted his life to the subject, all embarrassment in the selection of the proper remedy is avoided. Moreover, they are efficient and reliable, and it is indisputable that people who habitually use them have less sickness, better health and live longer than others. The specifics may be obtained in single vials or in cases at all homeopathic and other drug stores; also from the general depot at 109 Fulton street, N. Y.—*Adv.*

Rifle and Tray Shooting.

MILITARY RIFLE SIGHTS.

Editor Forest and Stream:

The rules defining the military rifle as laid down in the regulations of both our own N. R. A. and that of Great Britain are very unsatisfactory, and it is very much to be desired that they be so modified as to be intelligible and in conformity with modern conditions.

It has been observed that our definitions are so vague as to be susceptible of almost any construction that the directors, for the time being, may see fit to put upon them, while those of Great Britain are entirely behind the times.

The definition of the rifle itself is well enough—that governing the sights being in need of revision, I therefore submit the following, in the hope that it may call forth criticism from those interested, and thus that something tangible may be evolved.

MILITARY SIGHTS.

Foresight—May be of the pattern adopted by the U. S. Government for their service rifle, or of that on the Borchardt military gun. [The British N. R. A. objected to this sight as not being strong enough to stand the rough handling of field service. The answer is that it has stood the roughest handling that our troops on the plains and many frontiersman and scouts could give it, and this it will be admitted is a pretty thorough test.]

Backsight.—The backsight must be attached to the barrel in front of the lock [In the ordinary rifle this requirement would seem to be absurd, as it could not be attached to the barrel anywhere else; but in the bolt guns, such as the Hotchkiss, Lee, etc., it might be placed behind the bolt where, though a better sight might be taken from the back position, it would interfere with the manipulation of the action.] and must comply with the following conditions:

First—To be strong enough for service purposes.

Second—To be so simple of construction that its use can be readily understood by men of ordinary intelligence already familiar with the use of the Springfield or similar rear sight. [This would preclude the use of verniers.]

Third—To be so easy of manipulation as to admit of the rapid adjustment both of elevation and wind gauge, for any range that may be required in skirmish firing. [Some of the recent so-called military sights, which are nothing more than the sporting vernier sights, only considerably complicated, are far from filling this condition. To illustrate this: Suppose a party of sharpshooters armed with rifles furnished with these sights, to be firing at an enemy 1,000 or 1,200yds. off, and to be suddenly attacked by a skirmish party at short range, a condition of affairs that might very readily occur. They would be reduced to the alternative of holding under some 10 or 15ft., in returning the fire, or be compelled to waste two or three precious minutes in adjusting their sights to the new conditions, and it is a notorious fact, that when men are under fire, it takes twice as long to perform an operation of this kind as it does under less unpleasant circumstances. In any case it will be admitted that our sharpshooters, as described above, are at a great disadvantage.]

Fourth—Aperture.—The back sight may be fitted with an aperture provided that it shall also have a notch for sighting over the bar, and that the sight can be adjusted to use either aperture or notch. [The reason for allowing the aperture is to be found in the peculiar atmospheric conditions that are frequently met with in this country. With a strong mirage the object aimed at will appear to dance along the top of the bar, and will appear so distorted that aiming becomes a matter of guess work, and the gun will never be held twice exactly alike. The aperture corrects this distortion in a great degree, and the gun can be held with reasonable accuracy on the same point for successive shots. In dark, overcast weather the object cannot be seen with sufficient distinctness through the aperture, hence the necessity of the open sight, which is also best for rapid shooting at all times.]

Fifth—Spirit Level.—A spirit lever may be employed provided that it is attached to the backsight and in such a manner that it does not interfere with the instant adjustment of the elevation and wind gauge for any range. [Several of the military sights introduced do not fill this condition. In these the spirit level must be detached from the sight altogether for ranges under 800yds. See remarks on skirmish firing.] If thought desirable the spirit level may be made detachable and when not in use may be carried in a recess made for it in the stock of the gun, similar to the patch box on the old muzzleloading rifle. [I think that there can be no valid objection to the employment of the spirit level as described above. It is so placed as to be more effective than if fastened on the front side as in the sporting rifle. It is out of harm's way so as to be little liable to damage, and if it does happen to get broken the gun is in no way disabled. While its utility, I had almost said necessity, at long range is unquestionable, I believe that most of those who object to the use of the spirit level as an unnecessary refinement have had so little experience in long range work that they fail to comprehend the great advantage to be derived from its adoption. If any of these are still unconvinced after having given it a fair trial they may readily remove it from their guns, and those who retain it will certainly not be handicapped thereby. In conclusion I think that a simple, strong and practical service sight may be constructed complying with these conditions and that shall also possess all the refinements requisite for accurate long range work. The necessity for these refinements become more apparent as the range is increased, and it is quite probable that with the improvement in the construction of this gun and its ammunition still going on, we shall see matches shot at ranges now thought impracticable, possibly 1,500 or even 2,000 yards. JAMES DUANE.

MOTT HAVEN, Jan. 25, 1885.

RANGE AND GALLERY.

NEWARK, N. J.—The first tournament for the present season opened very quietly on the range of the Frelinghuysen Club. The plan is to have a series of matches until each range in the central body has been fired over. There is little interest taken in the contests, but it is hoped that before the end of the winter something of the old-time enthusiasm will be shown. The shooting was at gallery distance, at the combined Zettler-Creedmoor target. The scores stood:

Domestic Rifle Club.	Zettler.	Creedmoor.

GALLERY SHOOTING.—The latest novelty in the pistol and rifle shooting world at Conlin's Gallery, 1,225 Broadway, cor. Thirty-first street, is the competition between the Americans and the French, at the Gastinne Renette, or Parisian target. The Americans have done well so far, and from present appearances they bid fair to defeat the best shooters of the French capital, as they have done in the English and Irish cities. Another new feature is the introduction of the .22-cal. repeating rifle and the Dr. Carver mode of shooting, at which some good work has already been accomplished. Mr. George Bird fired 25 shots in 35 seconds, making a score of 109 in a possible 125, at a reduced Creedmoor target. Mr. R. V. R. Schuyler made with the same gun 49 bullseyes out of 50 shots at the word. Mr. Pierre Lorillard, Jr., made 27 bullseyes out of 29 shots with the same gun. The following are some of the scores and fancy shots made lately at Conlin's:

Frederick Sands, at swinging target, 1in. bullseye, 49 in a possible 50.

R. V. R. Schuyler split 7 cards in 10 shots, hit 12 pipes in 13 shots, hit 11 No. 000 buckshot at the word, hit 9 pipe stems in 10 shots at the word.

Pierre Lorillard, Jr., with pistol, hit 9 pipes in 10 shots.

J. T. B. Collins, at French targets, 68 in a possible 84, at 16 metres.

Maynard Bixby split 7 cards in 10 shots, hit 11 No. 000 buckshot at the word.

W. K. Griffen split 7 cards in 10 shots, hit 8 pipe stems in 10 shots.

Chas. F. Jones split 3 cards in 6 shots with pistol.

Edward Kelly split card on first and third shot with pistol.

JAMESTOWN, N. Y., Jan. 20.—Record of shooting of the N. Y. P. & O. Club, Jan. 7, 8 and 9, distance 40 rods; rifles, any "baby cannon" under 30 pound's weight; targets of 10 shots, string measure, from center of ball hole to center of target; any sights allowed, gun to be held to the shoulder, with muzzle rest of any description, and slide blocks under breech of gun. All guns above thirty pounds as shot, to be handicapped. The following are the eight highest scores, measuring each 10-shot string by inches and sixteenths:

H. F. Hart, Rochester, N. Y.			H. V. Perry, Jamestown, N. Y.		
1st day. 3 strings, 30.02, av. 10.01			1st day..3 strings, 41.12, av. 13 14

12	195.02	16.05	11	191.03	17 06

The above shooting was done with muzzleloaders. BLANK.

BOSTON.—There was not a large attendance of riflemen at Walnut Hill to-day, but those that were there enjoyed themselves. The weather was much too inclement to admit of out-door shooting, so the shooters lowered a window at the top and shot through the opening. In this manner the day's shooting was done, and although the wind was a difficult one to control, Mr. Fellows succeeded in making a fine 83 in the victory medal match:

Practice Match—Decimal Target.

J N Johns	6 9 8 5 8 10 7 8 6 10—77

Zubiller 97, D. Lowitzki 96, A. Shaw 95.—A. LOBER, Secretary.

THE PLUGGED PISTOL AGAIN.—High Point, Mo.—*Editor Forest and Stream:* Once upon a time, when I was younger than I am now, I owned a large Remington army revolver, with which I was in the habit of amusing myself. One day I loaded it up and emptied the cylinder at a barrel on the edge of the river, 100yds. away. Not seeing any of the bullets splash the water nor kick up the dust, and not finding any marks on the barrel I was puzzled as to the whereabouts of the bullets, but on attempting to clean the pistol, found the six bullets lodged in the barrel of the pistol. I attributed the lodging to the hardness of the bullets, which were moulded from scraps of anything that would melt, such as scraps of zinc, pewter, britannia, lead, etc.—OSAGE.

THE TRAP.

BOSTON GUN CLUB.

WELLINGTON, Mass., Jan. 21.—A brilliant assembly of shooters met together at the above shoot, to carry through the programme which was of unusually attractive character, the match between Messrs. Eager and Stark producing great excitement. The wind blew strong; otherwise the day was fine and well adapted for the sport. Being looked upon as the final chance of practice for the grand tournament in New Orleans, the traps were carefully set at their hardest, the angle of elevation being kept within the limits of 15 to 20 degrees, and also solid to the trapsland, thus giving the clays their fullest flight. Prizes for the best averages through the day were taken, first, W. S. Perry; second, H. W. Eager and W. L. Davis; third, O. R. Dickey.

First event, 5 singles, 1 trap, 18yds.: Kirkwood 3, Wilbur 3, Dennis 5, Gerrish 4, Sampson 4, Allen 2, Davis 5, Gilman 5, Evans 2, Eager 4, Perry 4, Dickey 5, Alden 2, Cooper 3, Field 2, Clark 2, Gray 0, Tinker 3, Hall 3, Gilman, Dickey, Dennis and Davis first, Eager second, Cooper third, and Allen fourth.

Second event, 3 pairs doubles: Eager 6, Sampson 4, Kirkwood 4, Perry 5, Field 1, Dickey 5, Gilman 4, Wilbur 3, Allen 4, Davis 6, Dennis 6, Gerrish 3, Hall 6, Gray 3, Cooper 3, Tinker 3, Clark 3, Evans 3. Dennis first, Perry and Dickey second, Kirkwood and Allen third, Wilbur and Gerrish fourth.

Third event, 7 singles, 18yds., 1 trap: Kirkwood 6, Wilbur 3 Gilman 4, Cooper 6, Dennis 4, Allen 5, Dickey 4, Sampson 5, Gerrish 3, Tinker 5, Davis 5, Eager 4, Clark 4, Evans 3, Hall 3, Perry 7 Gray 2, Field 3. Perry first, Kirkwood and Cooper second, Sampson third, Gilman fourth.

Fourth event, 3 pair doubles, 15yds.: Eager 4, Kirkwood 1, Wilbur 4, Gerrish 5, Dennis 2, Davis 6, Perry 5, Clark 2, Gray 4, Tinker 2, Field 4, Cooper 4, Gilman 3, Dickey 6, Allen 4, Evans 3. Davis and Dickey first, Gerrish and Eager second, Field third, Gilman and Evans fourth.

Fifth event, 7 singles, 5 traps: Kirkwood 3, Wilbur 3, Gerrish 4, Eager 5, Dickey 4, Schaefer 4, Dennis 4, Perry 6, Stark 3, Cooper 5, Gilman 3, Sampson 3, Allen 5, Davis 4, Faulkner 1, Tinker 2, Gray 3. Perry first, Eager and Cooper second, Dickey, Dennis and Davis third, and Gilman fourth.

Sixth event, 3 pair doubles: Kirkwood 0, Dennis 3, Gerrish 3, Eager 3, Dickey 4, Wilbur 3, Snow 5, Black 4, Clark 4, Nichols 2, Perry 6, Cooper 4, Stark 4, Tinker 3, Field 5. Schaefer 2, Davis 4. Perry first, Snow and Field second, Stark third, Wilbur fourth.

Seventh event, 5 singles, 18yds.: Gerrish 3, Kirkwood 2, Snow 3, Allen 3, Williams 2, Faulkner 1, Smith 0, Davis 2, Gray 3, Stark 3, White 3, Black 5, Cooper 5, Nichols 3, Eager 4, Wilbur 1, Gilman 4, Alden 1, Dickey 5, Sampson 2, Dennis 2, Schaefer 3, Perry 3, Evans 2 Black, Cooper and Dickey first, Eager and Gilman second, Gerrish and Stark third, Kirkwood, Gray and Sampson fourth.

Eighth event—Special match between C. M. Stark, of Dunbarton, N. H., and H. W. Eager, of Marlboro, Mass., at 50 singles and 25 doubles; singles at 5 traps:

C. M. Stark.

Singles	1111111111010101110011101101111111111111110110—43
D'ls	10 11 11 11 11 11 11 11 01 11 11 01 10 00 11 10 10 11 01 00 11—34—77

H. W. Eager.

Singles	1101100111010111011100111011100100111001011111—34
D'ls	11 11 11 11 10 01 10 10 11 11 11 11 10 01 11 01 11 01 01 11 11 10 10 15—38—72

The match began at 1:30 and finished at 2 o'clock. Each train up to the time of shooting brought additional accessions of spectators, showing that the reputation of the shooters was well known throughout New England. Messrs. Gerrish and Perry judged, Mr. Cooper, referee. Everything passed off in an admirable manner, and although there were many partisans of both, the best of feeling existed right through. The thirty-fourth bird banked, making one-half of one per cent. for the match.

Ninth event, 2-man team match, 7 singles and 3 pair doubles each:

Singles.		Doubles.		
H W Eager	1011111—6	11	11	01—5
W S Perry	0111111—6—12	10	11	11—5—10—22
C H Dennis	0101010—3	10	10	10—3
O R Dickey	1110111—6— 9	10	10	10—3— 6—15
C H Gerrish	0100111—4	11	00	10—3
A F Cooper	1111100—5— 9	10	10	11—4— 7—16
C D Gilman	1011010—4	01	00	10—2
W L Davis	1110110—5— 9	11	11	10—5— 7—16
C M Stark	0001100—2	11	10	10—4
E W Law	0001011—3— 5	10	10	11—4— 8—13
R Schaefer	1110111—6	11	11	11—6
G A Sampson	1111101—6—12	10	00	11—3— 9—21

Eager and Perry first, Schaefer and Sampson second, Gerrish and Cooper fourth.

Tenth event, 3 pair doubles: Eager 5, Perry 5, Dennis 2, Kirkwood 2, Wilbur 3, Dickey 3, Smith 3, Faulkner 2, Davis 1, Dutton 2, Gerrish 5, Schaefer 5, Stark 4, Sampson 4, Allen 2, Snow 3, Field 3. Black 4, Evans 4, Cooper 4, Hunter 4. Eager first, Stark, Black and Evans second, Field third, Kirkwood, Faulkner and Allen fourth.

Eleventh event, 20 singles: Eager 15, Stark 14, Cooper 11, Perry 18, Dickey 17, Gerrish 12. Perry first, Dickey second. Eager third.

Twelfth event, 5 singles, 5 traps: Perry 4, Eager 3, Stark 4, Smith 3, Faulkner 4, Stanton 2, Dennis 1, Dickey 1, Black 2, Snow 5, Hunter 3, Sampson 1, Gilman 1, Davis 2, Wilbur 2, Cooper 4, Dutton 3, Allen 1, Hart 1, Gerrish 5, Field 4, Hunnewell 2, Moore 2, Schaefer 2, Kirkwood 5. Kirkwood, Snow and Gerrish first, Perry and Stark second, Eager third, Davis and Schaefer fourth.

Thirteenth event, 3 pair doubles, 20yds.: Kirkwood 3, Eager 4, Simpson 3, Snow 5, Dickey 6, Stark 3, Field 2, Perry 5, Davis 5, Gerrish 3, Black 3. Dickey first, Perry second, Eager third, Gerrish and Black fourth.

Fourteenth event, 5 singles: Kirkwood 5, Stark 5, Perry 4. Sampson 2. Black 2, Eager 3, Gerrish 3, Dickey 3, Davis 3, Hart 3. Stark first, Kirkwood and Perry second, Eager third, Black fourth.

Fifteenth event, 3 straightaways: Gerrish and Black first, Dickey second, Snow and Davis third.

This finished the regular events of the day, and when the last shooter had left the platform few would have believed that some 7 bags of shot and some 40 pounds of powder had, not long before, been hurled after the featherless doves of Cincinnati.

UNION vs. JERSEY CITY HEIGHTS.—The return match between these two clubs took place at the grounds of the former club, Spring Valley, on the 24th inst., and proved a very pleasant affair. The day opened with a very unpropitious outlook as to weather, mist, drizzle and fog, and as the Jersey boys are not much on the clay-saucer racket, very few responded—barely a half dozen, where a score were expected. But they missed a more than good time. Let a challenge come from any club in the United States or the universe at live birds for 25, 30 or 40 men a side, and the J. C. H. are ready always. The Union boys showed themselves to be equal to the occasion; met the delegation from Jersey City at the depot, and escorted them to the hotel. After a bounteous dinner at which, of course, there were many good things said and done, etc., they repaired to the grounds. The Union Club is a young club as yet, but it contains among its members some of the best disciples of the trigger and prominent citizens of its vicinity. When such a genial master of ceremonies as Col. Townsend, assisted by such efficient aids as Dr. Grindle and Tomkins are on hand, no visiting club can feel but that it is good to be there—even if they are beat. These friendly shoots even at mud saucers or glass balls are a good thing. It brings the boys together socially, and where will you find a more whole-souled or genial class of men than the lovers of the gun and dog? The J. C. H. boys had a good time, and they hope soon to see the Unions again on their own grounds at Marion, when the result as to score may be different. The following is the score in brief:

Union.	Killed.	Missed.	J. C. H.	Killed.	Missed.
Tomkins	7	3	J Von Lengerke	8	2
Jersey	6	4	Heritage	5	2
Fisher	7	3	Van Brunt	7	3
Van Riper	6	4	Baker	7	3
Christopher	7	3	Yerrington	5	5
Blackledge	6	4	Lichtenberg	7	3
	39	21		42	18

—JACOBSTAFF.

CANARSIE, Long Island, Jan. 19.—Glass-ball match, between the Parkville Gun Club, of Parkville, L. I., and the Canarsie Gun Club, of Canarsie, at 20 balls each, 18yds. rise, revolving traps. Mr. James Clark, who shot with the Parkville club, did very well considering that this was his first attempt. After the match we all repaired to the oyster stews, which the Canarsie boys had prepared. Another match will take place Jan. 23. Score:

Parkville.	Canarsie.

CHARLESTOWN, Md.—The second match between Charlestown and Principio Gun Clubs was shot at the latter place on Tuesday, 20th inst. The Charlestown club was crippled, owing to the absence of one of its best shots, but managed to beat its opponents one ball. Richardson made the highest score, breaking some of his balls a distance of 60yds. Our club can now justly claim the championship of the county. Conditions; 15 glass balls, 21yds., Card's rotating trap:

Principio Team.	Charlestown Team.

NARRAGANSETT GUN CLUB.—Weekly shoot, Jan. 2, notwithstanding the terribly cold weather a goodly number were present to contest. Valentine won first, a keg of powder, and Barney, of the Watchemoket Gun Club, second, half dozen napkin rings. The high wind and extreme cold tended materially to reduce the scores which were as follows:

B Valentine	1111111101111110101011010100—22
G Barney	1111010111111010111111000100—21

NEW ORLEANS, Jan. 23.—Capt. Bogardus returned to-day to the city from his home in Illinois, whither he went a few days ago to take his wife. The Captain says he will at once get to work practicing for his match with Andy Meaders, and in order to facilitate his practice as well as create some interest in clay-pigeon shooting among our local shots, he will put up to be shot for a valuable silver cup which he has won, which he will shoot for against six of the local marksmen. The conditions will be, he to kill 150 clay-pigeons and his six opponents to kill the same number, that is, each man to kill twenty-five; there is to be 18yds. rise, the birds to be sprung from the fourth notch. The terms of the Bogardus—Meaders match have been definitely determined. It will occur on Feb. 7 and 8, for $250, the winner to take all the gate money. The birds will be clay-pigeons, 100 singles at 18yds. rise, and 50 pairs of doubles at 15yds. rise. Capt. Meaders sent his forfeit money of $50 to New Orleans last Saturday and will leave for New Orleans on the evening of the 4th. At his last practice at the Fair Grounds he made a record of 90 out of 100 singles and 79 out of 100 doubles, the birds being sprung from five traps. This latter was a better record than was made by the winner of the Chicago cup last year, who won $1,400 on a record of 68 out of 100 doubles.

JERSEY CITY, N. J., Jan. 24.—A trap and handle match between Wilms and Hethrington against Piercey and McNeil, all of New Jersey Gun Club, was decided Jan. 22, at their grounds at Marion, N. J. Each furnished for each other the best birds that could be got, and they proved all each party hoped for. Assisted by a strong wind, the boys got many an unlooked for "goose egg." Conditions were 10 birds each, 25yds. rise, ground traps, one barrel:

Piercy	110*000*1111—6	Wilbus	0011000*100—3
McNeil	1110011101—7—13	Hethringtou	1001110100—5—8

* Dead out of bounds.

THE CLAY-PIGEON TOURNAMENT.—Cincinnati, O.—*Editor Forest and Stream:* The O. & M. Railway, by courtesy of the well-known sportsman, Gen. W. B. Shattuc, has placed a special through sleeping car at the disposal of sportsmen of this section to attend the above tournament. The train will leave here Saturday, Feb. 7, at 7 P. M., from the Grand Union Depot. Fare from Cincinnati for the round trip $13, good for 40 days; if returned within 15 days, a rebate of $5 will be allowed. Sleeper extra at $2 per night. All sportsmen who intend to go by way of Cincinnati should secure a berth now, either per Al. Bandle, 260 Main street, or per Julius Reis, 68 West Third street. Tickets to be obtained by addressing the latter.

"TRAP AND TRIGGER" is the name of a new paper started in Cincinnati, O., devoted to the general interests of sportsmen and to give special attention, we presume, to the subjects named. The first number makes a very creditable appearance.

Yachting.

FIXTURES.

June 20.—Hull Y. C., Pennant Matches.
July 11.—Hull Y. C., Cruise.
July 18.—Hull Y. C., Club Race.
July 25.—Hull Y. C., Ladies' Day.
Aug. 1.—Hull Y. C., Club Race.
Aug. 15.—Hull Y. C., Open Race
Sept. 5.—Hull Y. C., Champion Race.
Sept. 19.—Hull Y. C., Champion Race.

RACE FIXTURES FOR THE YEAR.

LIKE the first crocus from under the snow, very welcome, but not quite justified by the thermometer, comes the announcement of the fixtures of the Hull Y. C. for 1885, which heads our columns this week. Whatever excuse there may be in the season and the demands of other duties and amusements, all of our yacht clubs should, for their own sake, speedily follow the example of the Hull Y. C. and settle on the dates for the main events of the season. We have spoken to the same effect each year; but most of them are content to leave the matter until the last possible moment, by which time they are sure to interfere with some other event. About New York, the principal event of the season is the regatta week of the three largest clubs in June, and an early selection of dates by them will allow the smaller clubs to arrange their races so that they will not conflict. After June, the races at the Sound ports might be arranged with some reference to each other, as a step in the direction of the custom of making the rounds each season. Most of our yachts cruise East every summer, and with a little system and co-operation, races might easily be arranged at Larchmont, New Haven, New London, Greenport and other points, ending with the week in August at Newport, where the Eastern fleet, after a similar round, would join the New York yachts. Such a system would be much better than the club cruises now made each year, as the race day in each port would be the occasion for a general turn out of the local yachts, some of which would participate and accompany the fleet further.

Canoeists, bicyclers, and the patrons of other less prominent sports have realized the many advantages to be gained by union and co-operation, and have each formed a national association, with one system of rules for all clubs. The first in particular, a sport now but fifteen years old in America, has within five years formed a national association with an admirable system of government, has enlisted nearly a thousand members, and has adopted a thorough and systematic classification for its boats, which, with its sailing rules, is accepted as a standard by every canoeist in the country, and the canoeists are to-day further advanced in the matters of measurement and government, after five years, than our yacht clubs promise to be in the next decade. Yachtsmen may some day see a similar movement in yachting, a uniform system of measurement for all clubs, a general government to decide disputed questions, and several series of races, each open to and entered by all yachts within a reasonable distance. It will probably be some time before such an end is reached, but in the meantime it is within the power of every club to hasten that time by such an early arrangement of dates each year, settled as far as possible so as to permit of entries from other clubs, and we hope soon to have a long list to add to that of the Hull Y. C.

A SCHEME FOR CLUB QUARTERS.

IT is with great pleasure that I notice the formation of a new club devoted to a field not yet occupied in New York waters. The proposal to call into life an association dependent upon canoes, sneakboxes and small cruisers in general is an undertaking which deserves the heartiest support from your paper and co-operation from all boat owners. The time has arrived when small boats should assert their dignity through the wide-reaching influence of united action for the common benefit. In the hands of the right men, animated by the right spirit, there is a bright and beneficial career of prosperity ahead for a well-devised scheme upon which to combine small boats of any and all character. They can be numbered by the hundred in these latitudes, and as yet their light shines but under a bushel for lack of headquarters and the propagation of their kind through common action. We have no sympathy with open ballast shifters, for they are a bane to yachting in small boats, increasing the cost of construction and surrounding their sailing with all manner of hindrances, as well as fostering mistaken methods and ideals. Let such imitation yachting shift for itself. The sooner it comes to a natural end the better for the real sport which will survive. Yachting about New York has no need more urgent than a collective life, under which small craft may pool their issues and pull together for that recognition which is at present denied them for the very want of a habitation and a name, an existence as a powerful body instead of acting with desultory effect in individual capacity. Those whose heart is with the sport, in the sport, need not to be told of the absorbing interest which the designing and personal management of a small boat is certain to foster in every one the least addicted to muscular exercise, and corresponding ambition to learn and excel in the studious side the vast realm of nautical art and science offers to the earnest devotee. The manly aspect of yachting as well as the appreciation of the basic lore upon which the pastime is built, has made wonderful strides in America during five or more years past. Adepts, specialists, experts, have risen in swarms, and their influence has already given to yachting on a large scale a discriminating standard widely accepted as the law in such matters. But in the fleet of small yachts we have lagged. We have not yet laid out a course to be pursued with an eye to systematic advancement. Example is an all-powerful teacher in every walk of life, and example, intelligent example, by the leaders for the majority to accept, is still wanting in that chapter of sailorizing of which the small boat is the exponent. The small boat of the day is a despised article of furniture, with neither rank nor dignity conceded. She flourishes in a haphazard sort of way by permission, but fails to command the respect and attention her special adaptability to the end entitles her to claim.

I assume the objects of yachting are to be summed up in the development of health and strength to the body and the senses brought into play; and, second, in directing thought upon a path of investigation and experiment in all the branches relating to the build and the subsequent mastery of a tool of our own creation. There are those who endeavor to frown down or ridicule such a declaration, claiming in turn that yachting should be approached from the standpoint of a lounger attempting to while away time, profiting at most from the fresh sea air incidental to dawdling about afloat; a reputable substitute merely for the more disreputable occupation of hanging round the street corners, or perhaps an agreeable variation upon billiards and tippling. But I have never found those advancing such notions to be yachtsmen themselves or imbued with the masculine Olympian spirit which rejoices in athletic achievements, and prides itself upon physical prowess in competition. In countries where yachting has more fully ripened in its greater age than with us, that high measure has long been accepted which interprets the sport as an occupation for hardy men, ambitious to meet and conquer nature in all her wiles, unruly and turbulent the same as when wreathed in smiles of sunshine, with riplets musically lapping the bilge. And here in America time is certain to pilot us up to the same goal which insists upon recognizing a standard of bodily vigor and mental thoroughness as essential to the full realization of a diversion we should gladly hail as a chance to acquire and display drastic courage and intellectual pre-eminence.

The best evidence to hand which proves these views to be in accord with those of the thinking half of the yachting world is the success attained by FOREST AND STREAM. In spite of its policy of siding with a style of boat unpopular in earlier days, your paper has won the support of the masses, including even those whose views it most opposed. Espousing the cause of yachting as a dignified pursuit for manly men, you have distanced rivals who sought to climb into the public's affection by pandering to the effeminate, the purely social or picnic aspect, and whose labors have tended to degrade the sport from the plane of brawn and brain to the lower level of physical indolence and languid mental vacuity. We, in America, are not one whit behind other nations in muscle or mind, and we have the same aspirations in common with all possessed of strength to body and force of character. Emulation is our second nature. Those who proclaim American yachtsmen a crew of old hens incapable of worthier aim than to loll about forever under an awning, or drift from port to port in trifling weather, shirking that which involves a bold contest and a spice of hazardous adventure, know little how to estimate at full the stamina and pluck of our race. Persons who write all our yachtsmen down as sickly, puny kids, frightened at a salty dusting, ready to dive for the cabin or come to for the day the instant the plug is out overhead, are libellers of a people whose nerve and aggressive impulse have brought a continent underway. There may be some who yacht as old women, who don men's togs by an oversight of nature in bringing them forth. There are others, however, more than an offset, who are not only men is their outline structure, but in their tissue as well. Great Scott! They to yacht in the same way? Dawdle, dawdle, all time long, up the Sound and down the Sound, up and down again? Never! Not much. But the enemy is active in the camp. He is doing his best to befog the public mind, to hold up a counterfeit presentment of what the sport is or ought to be. He is piping the same old chicken-hearted tune. It is from the cowards who flinch at the mere mention of the work and self-denial, which ought to constitute the prime delights of yachting, that prosperity in the future has most to fear. Against these Bourbous and their womanish interpretation, it behooves the small-boat men to combine, so that in unity they may show their strength, and proffer to the public an example of what true yachting really is, and how it can be pursued upon a tithe of the outlay for large vessels, with gratification in full even to overflowing. Hence an honest effort to create a new club in which small boats shall be the biggest, and not merely a rag, tag and bobtail to vessels overawing them in pretensions, should find a quick and hearty response from all who have yachted in little craft, and from those who hang their affections by preference upon nominal tonnage, or expect some day to bend sail and twiddle the stick aboard a small thing which shall be thoroughly good, what there is of her.

Three things are necessary to the success of a club—headquarters, a safe anchorage and a policy.

HEADQUARTERS.—For this purpose nothing can equal an old hulk, a brig or a schooner, with lower masts standing, reasonably sound in her timbers and coppered if possible, with some of her ground tackle and old gear still on board. At auction or special occasion a suitable vessel, whose career in trade has been brought to a close through old age, can be bought for a song. As she stands, after cleaning and painting the hold she will serve the purpose. The cabins would constitute the room for general meeting. A port would be cut in the side, and a staging with an easy ascent moored alongside. This, with a companion ladder leading up to the deck, would do duty as a landing for yawls and punts pulling off to the yachts, and also as a convenience to canoeists and others, as they could lift their portable property out upon the staging and walk it up the incline, through the port in the vessel's side, landing the canoes in the hold as a boat house. The expenditure of a small sum would provide large and roomy "tops" at the masthead, these tops to be say 6x10ft., braced below from the mast and encircled by a light rail of stanchions and lifelines or by a combination of gas pipe. The tops would afford a magnificent view of the waters surrounding and the race course for the boats. Exercise and proficiency in "going aloft" would be acquired in climbing the shrouds, which should be rattled down ship fashion. Stump topmasts or poles could be fidded in the caps, from which burgee and signals may be displayed. The deck itself suffices for a promenade and the collection of guests, for dancing, music, shuffle board or other games, especially if an awning be provided. The hold has space for lockers and boats. Spars, sails, etc., can be conveniently stowed therein during winter. If additional funds can be expended, a forecastle should be added for smoking room, bachelors' quarters, or if the club be ambitious, a drawing room for the designing of yachts and model library. The quarters can at any time be enlarged by flush decking with light scantling and plank, giving a second story to the structure, or a mansard roof can be thrown across from rail to rail. If a small beginning is contemplated, the first headquarters call for nothing larger than an old smack or a North River sloop. The chief advantages of this plan are self-evident. First, the cost of purchase would be considerably less than erecting a regular house on shore. No title or lease to real estate is required. No local taxation. And above all, the mobility of the whole concern. The floating quarters may be towed and moored to any spot desired, and shifted as occasion requires. The shores about New York Bay are so rapidly being turned to commercial use that a permanent structure would soon have to be abandoned or transported at great risk and expense. The hulk may be simply anchored and shifted about from place to place as an experiment, until a satisfactory location has been met. When, for example, one line of ferry-boats raises the fare and another offers lower rates, all hands clap on the windlass, hail the nearest tug, and in an hour you have escaped the grip of monopoly to more congenial climes. The prevailing winds of the season might also induce a change for convenience. Furthermore, the quarters would be nautical in aspect and in harmony with Corinthian sentiments. The hulk would also bring her purchase price any time if sold for old iron and copper. The one thing to be remembered is that she should be tight in the bottom to avoid the expense of recaulking below waterline. The topsides will take care of themselves, with a periodical coat of paint, on which, by the way, the title of the club should appear in bold letters. As a connecting link with the shore, a light staging of plank can easily be erected, both plank and the "bents" for its support being portable in character. Or perhaps the hulk could be tied up to a wharf.

ANCHORAGE.—Following out the plan of having the whole rig shifting in nature, the anchorage should be made to suit. Where no sheltered water is to be found, not even a cove, which can be sufficiently closed by mooring the hulk across the mouth, an artificial basin must be constructed. To this end invest in some old canal boats and moore to best advantage. Two spaced out ahead of the hulk, with the intervening breaks closed by floating booms fast to the boats will go a long way toward accomplishing the end, especially if some wharf or dock can be worked in to help out the scheme. If not too much exposed, a line of "booms" will suffice. A red light should indicate the entrance at night. By mooring the boat's head and stern with lines from ringbolts or stakes, a large fleet could find shelter in very small harbor. The boats could be cast loose and carefully sculled through the outlet, and should come to outside, lower away and warp or scull in, to avoid rushing headlong into the crowd. A lifeline rove outside the canal boats would be of assistance to lay hold of after rounding up, and also for hauling in. This artificial breakwater presents further opportunities for stowage, promenade, etc., a plank and manrope connecting the various links in the chain.

POLICY.—Few clubs have any policy at all. They exist along in a haphazard sort of way, just as likely to die in a day as to continue for a century. A little bickering or feud splits up the whole concern, or upon the withdrawal of a few leaders the rest wither away. All because clubs are not built upon a foundation more solid than that of ordinary friendship and sympathy for the time being. With few notable exceptions, the clubs in New York do nothing to deserve recognition, and they have no clear title to existence. Hence the precarious life they lead, and the paucity of yachts and members. About the chief attraction they present lies in the social or yachting status supposed to be represented by the club burgee. To pay $25 or so a year for that little piece of vanity may be well enough for the *nouveaux riches* asking to gain recognition in the world of society to which the club members belong, but it is not apt to draw many yachtsmen of the real sort. Beyond this, one or two tame races, and the club's account with its members is finished. The New York Y. C. supplies some inducement in the possession of agreeable city rooms for winter use. So it has at least an acceptable habitation on shore. But then it offers nothing for the summer, and nothing handy on the beach. The American Y. C. has done better, with a rendezvous on Charles Island and town rooms for the inclement season. This same concern has lately taken the lead in enterprise and live action with lectures and other innovations of a practical kind to keep things going all the year round. The Atlantic is quite practical, thanks to a few of its leaders. That club has at its service as fine a harbor as any in the world, besides summer grounds and a snug house on the property. A harbor is not to be sneezed at in summer, and in winter it becomes a safe place to lay up. The club holds forth more than abstract inducements, and therefore has prospered. But the quarters are distant and difficult of access in winter, and so six months in the year constitute a big gap during which club life is extinct except in name. This ought not to be. In the shifting hulk I have described a desolate period is bridged by simply towing her to some convenient pier and club life goes along all the year round without break, needless to say, immensely to the advantage of the club in every respect. Other organizations have sought to return an equivalent for the fees paid in, but so far not with alarming success. Now the very first object of a club should be to make itself a necessity and not merely an apocryphical adjunct to yachting life. It should offer attractions, the need of which all yachtsmen sorely feel. A new club especially should outline a course which would bring all hands into its net, and not do more to repulse than to attract. Not levy contributions for a more or less nebulous existence, but start out with a well-defined programme and live up to it as far as funds will allow. The first and most important step in the way of quarters I have described. Headquarters accessible twelve months in the year, with as few horse-car and ferryboat circumlocutions as possible. Next in order these quarters should be made tempting, captivating. Once its sweets have been tasted, the novice ought never to find himself able to relinquish. Every man is curious and inquisitive, and does not like to be distanced by others. Judicious play upon this failing is the key to building up a big and popular club, and doing the community great good in winning from frivolity and probable vice many a man who might otherwise have gone wrong. The policy should partake of a paternal interest in the welfare of Corinthians. The routine should lure them on, and the facilities and appliances of the concern should make them willing victims, until numbers alone invest the club with a dignity and power widespread and beneficial, and which will lift the ownership of small boats to the same level in public opinion now granted to the possessors of large yachts only. The library calls for attention from the outset. Not only the current yachting publications of this and other countries, but also the daily and evening papers should be found on the cabin table. A collection of nautical works and allied material should be accumulated, giving to the student a selection from the elementary up to the higher realms of art and science. Photos, litbos, and prints of yachts of all nations, as well as designs and models within reach ought to be supplied for the general good. In this respect, the New York Y. C. and the American Y. C. have set an example worth copying. Even home and foreign journals of mechanics and naval engineering, as well as illustrated and art publications, would contribute much to enhance the attractions. Reading and writing materials without stint would draw members to the club many an evening for the conveniences afforded, and in this manner acquaintance, a comparison of notes and observation, and wholesome discussion ensues, calling into being an *esprit de corps* to cement the union on a firm basis. Gaming and liquors should be eschewed, as the club is not instituted to serve as a private still where gin can be had at cost, or chips for a stake on tick, though possibly billiards and checkers might be permitted. To give further point to the routine, lectures on nautical matters could easily be arranged, as some one is always to be found who can discourse on topics with which the rest are not as familiar. Specialists could be impressed to dilate upon astronomy, navigation, construction and design, upon war and mercantile shipping, practical seamanship, boat service, treatment of drowned, etc., without end. Popular topics, such as a rehearsal of a long cruise, a voyage abroad, personal reminiscences and the like, would furnish variety to the proceedings which should be announced for every week. A large blackboard, the magic lantern, or the products of the amateur lens would aid in elucidation. Directions in photography alone afford a rich and interesting field to an audience of Corinthians. The display of all sorts of inventions and their collection could form the basis for a museum of yachting and boating appliances and fittings. Something of this sort should be underway every week, and twice a week would be still better to keep up the continuity of yachting thought at little expense beyond the cabin lamp and oil stove for heating. Instruction in plain drawing by one of the members who is an adept would soon enable zealous members to draft boats to their heart's content, and to understand similar work by others. It would make accurate critics where we now meet with wild guessing. The cost to the club need be but nominal. A pair of trestles, a long pine sawing across, some paper and schoolboy instruments are enough for the purpose, and many a disciple would spend a more rational evening generating cycloids, wave areas, or balancing rigs, than if left alone to spend his cash yawing wide about the city streets. Then, again, a portion of the hold or the forecastle, supplied with a capenter's bench and a kit of tools, might see models cut out of the block with dexterity for trial in spring, and open another phase in the routine of which banker, merchant, lawyer or clerk could avail himself for recreation in the pursuit of some hobby as to lines and type of hull. For a trifling sum an old tar could be on hand two or three times a week to give a course of instructions in practical knotting and splicing, in bending sail, furling, reefing and repairing, upon some dummy spars rigged up between decks, to which gentlemen of any age or calling could become parties. Visitors might be admitted to these gatherings to carry to their friends the new dispensation of yachting Corinthian as a most commendable occupation for any and all. Who will say that such a scheme would not redound to the club's growth in numbers and resources to an extent not yet dreamed! A thousand enrolled on its books would not be an estimate beyond the probabilities, and that can be attained by a few who chose to put their heads together and follow the line I have indicated. Surely there is a policy worth exploiting. There are many men to-day with time hanging heavily on their hands and with money to boot. A few hundred advanced from their pockets would set the ball in motion and accomplish more good for this generation, gathering in converts right and left from a wayward life to a fresh and honorable field, than all the impracticable schemes in which piety and humbug are the chief ingredients. But it is needless to consider this proposition from the standpoint of a benefactor to his race. A club upon the lines I have described, called into being solely from the interest the owners of small boats have in themselves and their property, would spread like wildfire, grow rich and potent beyond expectation, while at the same time supplying those accessories to yachting which, as individuals, boat owners can never hope to possess. A few words should be added in reference to the summer season. Besides a spring and fall match, open to all comers, club races should be held every fortnight, boats winning the majority in the season to receive some token or purse in appreciation. Cruising in squadron should form quite a feature. Start to be made Saturday, P. M, and return by Sunday, P. M. or by Monday morning, in time for business in the city. When funds have accumulated, they may be invested in an able craft of small rig, a sort of public hack, in which beginners can be taught or left to shift for themselves. Thus casual visitors would be induced to take to the water, and add fresh blood to the great band of Corinthians. Encourage everybody, encourage everything which leads to an appreciation of a life afloat in any and all of its reputable phases. Promote the manly and brainy side of the sport, and scout all that would fain consign an ennobling pastime to contemptible trifling, to a trashy counterfeit upon the genuine article, or to a mere gamble among the crews as in the sandbag races.

Upon this topic more might be written, but if the foregoing helps to shed light in dark places, it will not have been produced *in vain*.

C. P. KUNHARDT.

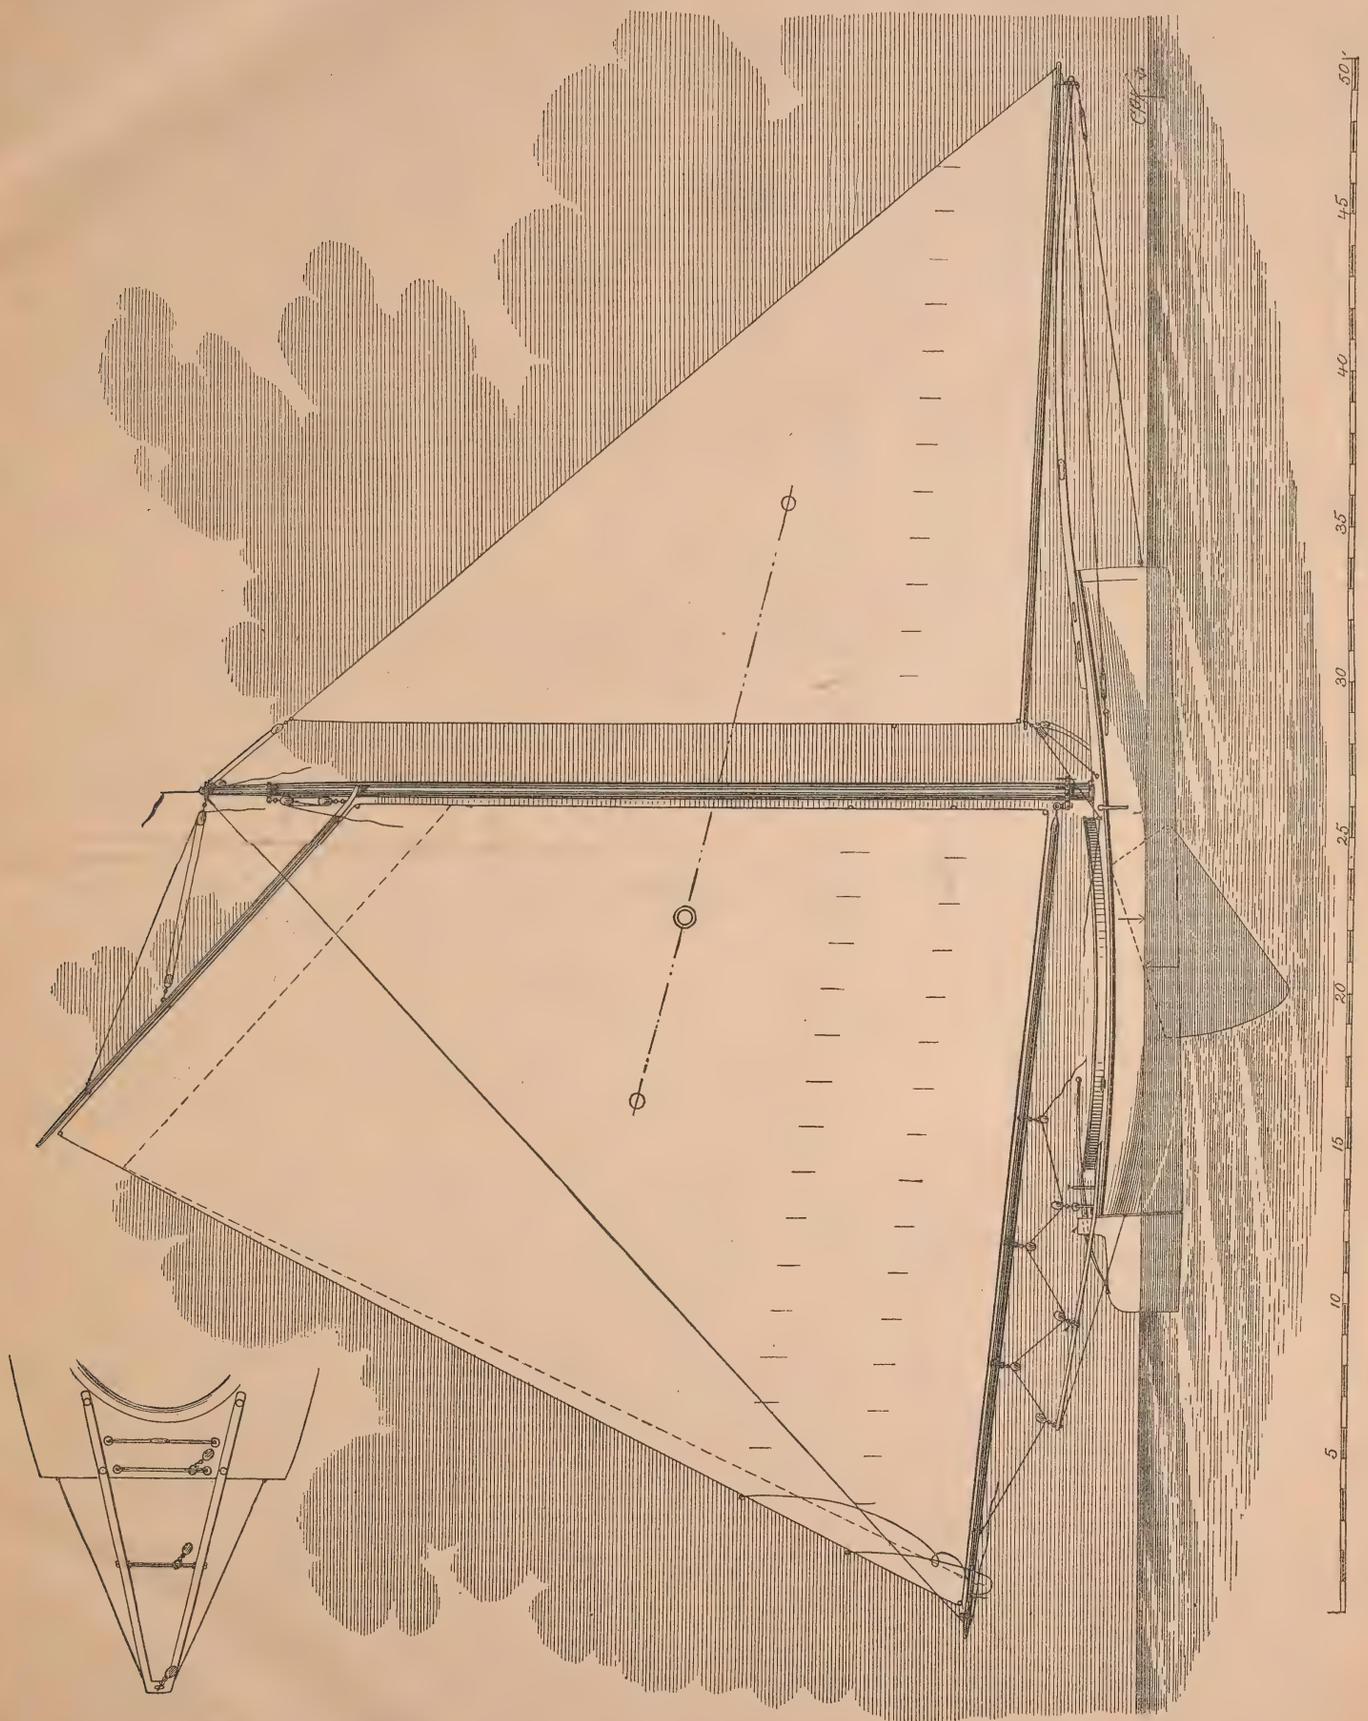
THE SAIL PLAN OF THE CRUISER.

THE accompanying sail plan shows the rig of the open boat Cruiser, whose lines were given in the FOREST AND STREAM of Dec. 25. The larger sail shown is carried only with 20 to 25 bags to windward in ordinary weather, but the mainsail alone is sometimes used as a cat rig, the mast being then stepped 20in. from the bow. With this cat rig five men, but no ballast, are carried; but with a good breeze some ballast is needed, unless a reef is taken in, the latter usually being preferable.

The smaller mainsail is the one usually carried with sloop rig, being the one originally fitted for her. With it she carries stationary ballast and a limited crew, or if the weather is very light, a crew of five only, the boat being lightened as much as possible, even the bottom boards being removed. This same mainsail is also used in cat races, but is too small for ordinary weather. All her sloop races but one in 1884, were sailed with this mainsail. The dimensions of sails and spars for this rig are: boom, 25ft.; gaff, 15ft.; mast, truck to heel, 28ft. 8in.; deck to hounds, 24ft. 3in.; bowsprit, outboard, 14ft. 6in.; jibboom, 21ft.; hoist of mainsail, 19ft. 6in.; luff of jib, 33ft.; hoist, 23ft.

The dimensions of the large rig are: Boom, 26ft.; gaff, 14ft. 6in.; mast, heel to truck, 31ft.; deck to hounds, 26ft.; bowsprit outboard, 16ft.; jibboom, 21ft.; hoist of mainsail, 22ft. 6in.; luff of jib, 33ft.; hoist of jib, 24ft. With this rig, the total area of which is 799.5ft. (mainsail 527 and jib 272.5), the center of effort is 19in. forward of the center of lateral resistance, and with the cat rig it is 7in. forward. The sheet, for smaller sails and cat rig, leads from boom to a double block on the traveler, thence through a single block on the boom down through second sheave of traveler block, and is belayed on a cleat carried on a second traveler spanning the tiller. When on the wind the sheet is led through a snatch block on the boom, near its middle. In the larger rig an outrigger is used, as shown.

Cruiser has proved herself one of the fastest boats of her type in all weathers, having won races in her every-day rig, when her competitors were compelled to carry smaller sails and more ballast. She works well with two-reefed mainsail and full jib, two-reefed mainsail and no jib, or with full mainsail and reefed jib. Besides her races, she has sailed to New London and back twice, to Newport and back once and to Fire Island and back twice, and has never been capsized, a most enviable record for a boat of her class.



CUTTER PRINCIPLES "WAY DOWN EAST."

OUR correspondence from all quarters shows a steady growth in public favor of those principles for which we have so long contended. We note elsewhere in a letter from Cleveland, a change in the direction of iron keel and double head rig, in one of their sloops; and the following extract tells the result of a similar change made last year in a yacht at Portland, Maine:

"It may be satisfactory to you to know that the 'Yacht Doctrine' preached by FOREST AND STREAM is having a good influence in this vicinity. I hear a great deal of talk about increased depth and bal last well down. Last spring I altered my sloop to cutter rig, less hoist, double headsail, etc., and I wouldn't think for a moment of going back to the old rig. My boat is 31.8 in all and draws 5.10, and with her present rig can be handled almost like a rowboat. The benefit and practical working of the cutter rig, as compared with the sloop was well demonstrated on the night of July 5, 1884. We ran 12 or 14 miles off this coast and from about 9 P. M. till 4 next morning experienced one of the worst summer gales known in this vicinity for years. Three reefs in mainsail, staysail reefed, topmast housed, everything inboard (how different from the old sloop) and notwithstanding one of the party prayed and then swore we never would see daylight, we arrived in Boothbay, that noon, July 6, in good order. My boat was liked so well last season in her new rig, that from the inquiries made I think others will make the change this season. B."

THE COST OF SNEAKBOXES.

—Mr. N. H. Bishop, the traveler and cruiser, to whose exertions the A. C. A. owes its inception and organization, has found a new field of missionary labor among the sneakboxes of Barnegat. Mr. Bishop has gone to work with his usual energy to stir up the local builders and induce them to improve the sneakbox as a cruising boat. He writes in regard to prices: "I have not seen a well built 12ft. box on these bays that can be bought for less than $45 to $50, and I should add in improvements at least $20 to fit them for cruising. Second-hand boats, 12ft. long, can be bought for $25, and even less. We have cheap boxes which would run under a head sea, yet the best box is a true climber, always sliding upward. A 16ft. box, of best construction, will cost, when completely fitted, about $125."

SAIL PLAN OF OPEN BOAT CRUISER.

AWAKE AT LAST.

SINCE the speed of the cutter has been proved beyond question, the opponents of the type have fallen back on the other details of safety, accommodation and sea-going powers, admitting their speed, but deriding them as racing machines and not yachts. For a long time the FOREST AND STREAM has stood alone in combating such ideas, which were only too readily accepted in this country, supported, as they were, almost unanimously by other journals.

As fast as our yachtsmen have become better acquainted with the real qualities of the boats, their ideas have changed, until many are ready to recognize the cutter as a bona fide cruiser as well as racer. The daily press, however, has held out for a long time against this view, but at last even they have begun to weaken, and now we are glad to welcome the first to flop over entirely, the New York *Herald*, which discourses as follows of the latest English yacht. After this it will be in order for the others to follow suit. Who will be next:

"It is easy to talk of these English yachts as mere racing machines, but many of them are much more than that. Lieutenant Henn, of the royal navy, whom we hope to have the pleasure of welcoming, is the owner of the Galatea, now on the stocks, and a gallant sportsmen. He has sufficient confidence in his craft to cross the Atlantic in her, and to bring his wife with him. He will extend his cruise to the West Indies, and is firmly convinced that his vessel will be quite equal to any emergency that the moody Atlantic may present. This does not look as if English yachts were built for speed alone without regard for neither safety nor comfort, that their preference for depth rather than breadth is a mere fanaticism, and that they allow their sailing masters to assume the perils, while they remain on shore to assume the honors of a race. This, however, is largely twaddle. It is time to recognize the fact that even we have much to learn on these matters, and that the ideal yacht is neither in British, nor yet in American waters, but in the future. We must not forget, either, that it will be no national calamity if the Cup shall be carried off. If it can be fairly carried off it ought to be. We do not desire a reputation which we do not deserve. To be beaten in an honorable contest will do us good. It will still further stimulate our interest in a fascinating sport, and during the next few years our yachtsmen will cross the ocean to recover the prize. At any rate we will accept the challenge in the true spirit of chivalry, and if we lose the race we will say, as the Frenchmen did at Fontenoy, '*Après vous, Messieurs les Anglais.*"

ELECTIONS OF OFFICERS.

Brooklyn Y. C.—The following officers for 1885 were elected at the last meeting, on Jan. 14: Commodore, F. Beames; Vice-Commodore, J. P. Tribken: Rear Commodore, Geo. P. West; Measurer, John M. Sawyer: Surgeon, Dr. W. J. Gilfillan; President, Samuel M. Whittlessey; Secretary, Wm. M. Moorhouse; Treasurer, Thos. R. Brown; Judge Advocate, W. C. Allen; Trustees, Charles W. Blosser, Charles Vanderburgh and R. C. Hopkins.

East River Y. C.—Commodore, J. Schusseli: Vice Commodore, H. G. Peabody; Secretary, H. T. Lewis; Treasurer, E. Grissim; Measurer, J. J. Driscoll: Sergeant-at-Arms, Oscar Joebach.

Lynn Y. C.—Jan. 6. Commodore, E. C. Neal; Vice-Commodore, E. H. Taylor; Fleet Captain, F. S. Newhall; Secretary, W. S. Newhall; Treasurer, J. W. Atwill; Measurer, C. B. Taylor; Trustees, J. W. Haines, F. W. Martin, J. F. Lee. Regatta Committee, W. B. Newhall, W. M. Rand, W. Hawkes, C. H. Lockhart, H. P. Armstead.

Pavonia Y. C.—Commodore, R. Puhlman; Vice-Commodore, F. Schumacher; Secretary, O. W. Stiebeling; Treasurer, H. H. Holmes; Measurer, J. Kreymeyer; Sergeant-at-Arms, W. Willis; Trustees, J. Wittpen, T. Lowery, C. Steurer, T. Sullivan, M. Connelly. The club will build a new and larger club house this spring.

YACHTING IN CLEVELAND.—*Editor Forest and Stream:* Your correspondent did not quite cover all the ground in his letter to you, published in the FOREST AND STREAM some time ago. The sloop Rover, which made such a good showing in the last 4th of July regatta, and which has also held the champion flag of Cleveland, will come out next summer with an iron shoe of 3,000 pounds. She will also have two jibs instead of one. The owners of the C. R. Davis were greatly encouraged by her work last summer, and intend to make some telling improvements on her. The owners of the Kids have sold their old boat and are building a cutter after lines published in the FOREST AND STREAM. The Gardner challenge cup will probably be won next 4th of July for the first time by a Cleveland boat. The Cora, of Chicago, is now owned here and will most likely win the cup. Yachting will receive a new impetus here by the proposed extension of the breakwater to the eastward of the piers.—BRASS.

OCEAN QUEEN.—Mr. R. T. Bush, of the steam yacht Falcon, has given to Poillon Bros. the contract for hull, spars and iron work of a large schooner yacht, to be named Ocean Queen. She will be 130ft. long, 26ft. beam, 12ft. depth of hold, with rockered keel, and is designed for a staunch, able cruiser, fitted to make a cruise around the world, which her owner expects to do if business permits. The accommodations will include a main cabin 24ft. long, besides seven staterooms. The tonnage of the Ocean Queen will be nearly 400 tons, making her the second largest schooner in America.

STEAM LAUNCHES.—All interested in this class of boats should send for the circular of Mr. E. E. Roberts, whose advertisement appears on another page. Mr. Roberts has been engaged for some years in the construction of steam launches of various kinds, and having made a specialty of them, he has been successful in turning out some fine little craft.

BOSTON NOTES.—Lawley & Son have the 35ft. cutter building for Mr. C. W. Jones ready for decking, while Mr. Binney's 26ft. cutter is now in frame. Alterations are now in progress on board the compromise sloop Thetis. Huron is entirely replanked, and will be nearly completed this week.

SAILS AND TENTS.—We are in receipt of a new and very complete catalogue of yacht sails, tents, flags and everything in the canvas line, just issued by S. Heinmenway, 60 South street. It will be a great aid to the buyer, and all intending purchasers of canvas goods should send for a copy.

ANOTHER SLOOP MODEL.—Mr. Kirby, of Rye, writes us that he has a new model for a sloop to defend the Cup, similar to his former boats, but larger. She would be 89ft. over all, 80ft waterline, 23ft. 6in. beam, 9ft. 6in. deep and 7ft. draft.

MANNING'S YACHT AGENCY.—This well known firm will issue a new edition of their circular in a week or two, with list of yachts for sale.

THIRTY CENTS A WEEK, at age 25, buys a life policy for $1,000 in the Travelers, of Hartford, Conn. Cheapest first-class goods in the market! Apply to any agent, or the home office at Hartford.—*Adv.*

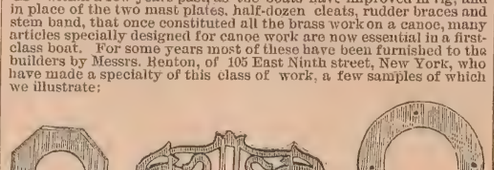
Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

L. M. H., Franklin, Del. Co., N. Y.—Is there any law in this State forbiding the catching of pickerel through the ice with tipups, if so, when does it close? Ans. There is no State law protecting pickerel at any time, nor forbidding their capture at any season.

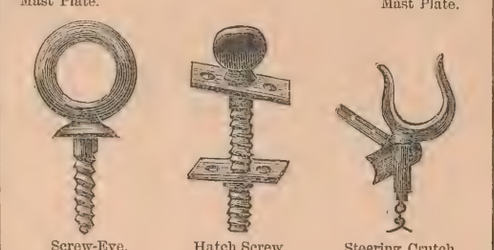
PETER POTTER, Pittsfied, Mass.—1. What is best works on trout raising? 2. Have an artificial pond about seven acres, excellent spring water. Would it be better to try young trout to stock or attempt raising? Ans. 1. "Domesticated Trout," by Livingston Stone, Charlestown, N. H. 2. It is cheaper to try eggs if you have facilities for hatching.

J. W. M., New York.—For general fishing, salt water and fresh, there is a rod made called a "general rod," having a hollow butt containing parts to make it either a stout, stiff bass rod, or a longer and more flexible rod for lighter fishing. They are necessarily heavier than rods made for one purpose. These rods are of ash and lancewood, and cost from fifteen to thirty dollars, according to mountings.



CANADIAN.—The proportions of length and breadth vary in different classes. The most serviceable dimensions will be 15ft.×30ins. Write to C. A. Nedé, Schuylerville, N. Y., for copy of "A. C. A. Book," and see the FOREST AND STREAM, Oct. 9, 1884, for full dimensions. The measurements are extreme length and extreme breadth, the latter not including beading. There will be a meet at Grindstone Island, beginning on July 24, 1885.

THE HOME INSURANCE COMPANY.—The statement of the Home Insurance Company for January, 1885, presents some interesting statistics. This is the sixty-third semi-annual statement, and shows the condition of the company on the first day of the present month. By this statement it is seen that the cash assets of the company amount to $7,395,090.55. Of this sum, $3,847,565 constitute a reserve premium fund, while the net surplus amounts to $1,141,726.91. The exhibit is one of which the company may be proud.



Canoeing.

CANOE FITTINGS.

THE number and variety of fittings for canoes has greatly increased within a few years past, as the boats have improved in rig, and in place of the two mast plates, half-dozen cleats, rudder braces and stem band, that once constituted all the brass work on a canoe, many articles specially designed for canoe work are now essential in a first-class boat. For some years most of these have been furnished to the builders by Messrs. Renton, of 105 East Ninth street, New York, who have made a specialty of this class of work, a few samples of which we illustrate:

Mast Plate. Rudder Yoke. Mast Plate.

Screw-Eye. Hatch Screw. Steering Crutch.

The mast plates, scew-eyes, rudder yokes, and hatch screws are made in various sizes and patterns to suit different models. Messrs. Renton also manufacture the rocker cleat, now generally used by canoeists, besides many other devices. Another department of their business is that of yacht and boat brasswork, of which they manufacture a large line. They have the right for New York State for the Waterwitch oar-lock, an entirely new device, by which the oar is held fast to the boat, but can be moved in any direction for rowing or sculling with perfect freedom. Besides brasswork, the firm also build boats and canoes of all descriptions for rowing, sailing, cruising, hunting and fishing. Their new catalogue, now in press, will contain cuts and descriptions of the many different articles made by them, and will be a useful hand-book for canoeists and boating men.

TORONTO C. C.

THE Toronto C. C. held its annual meeting at Com. Neilson's office on Friday, the 9th inst. at 8 P.M. The following officers were elected for 1885: Commodore, Robert Tyson; Vice-Commodore, John L. Kerr; Secretary and Treasurer, Frank M. Nicholson. Regatta Committee, Norman B. Dick and Arthur H. Mason. These five form the executive committee. Major E. Leigh was first elected commodore, but he declined the honor. The annual subscription was increased to five dollars.

Mr. Fred Mason presented to the club a new challenge cup to be raced for by Class IV. canoes. He also presented to the club three large flags bearing the sailing signal of the T. C. C.—a large red disc—to be used on the buoys in races.

The challenge cup now held by Mr. Neilson is to be competed for during the coming year in combined paddling and sailing races. The all-round sailing cup now held by Mr. Kerr will be sailed for as before. Each cup is to become the property of the first man who wins it five times.

The first Saturday in each month is to be set apart for a joint cruise, longer or shorter, as the case may be. No races are to be held on these days.

It was unanimously decided that the new rule of the A. C. A. requiring contestants in sailing races to carry their A. C. A. number at the peak of the mainsail, should not be allowed to interfere with the carrying of the T. C. C.'s own sailing signal—the red disc—in racing and cruising at A. C. A. meets.

Arrangements have been completed for a club-house for the T. C. C. It has long been felt by the older members that a rallying place would prove a powerful lever in increasing the membership of the club and generally improving its position. Last fall Mr. John Clindinning built a house on his property which he offered to the club, and now I have to report that a satisfactory arrangement has been made. Possession will be taken soon.

The house is 13×46, two stories. On the lower floor are racks for twenty-four canoes. There is a good wharf and a railroad from far end of house to the water. Sail racks are provided for all canoes. On the second flat there is, first, a locker room, 10×22, with at present seventeen lockers and room for more. A narrow hall leads past the locker room to the club room, 12.6×24, nicely finished in alternate strips of stained and plain narrow sheeting. The ceiling is also of narrow sheeting, painted white. A door leads from this room to a small balcony, where members can lounge in the summer evenings or bring their lady friends to see a race. In every way the new house promises to be a great convenience and a source of strength to the T. C. C. It is hoped all canoeists visiting Toronto will not fail to look us up, and we will try and make it interesting for them.

Clindinning has just finished two new canoes on the model of the Sapphire. Length, 14ft. 6in.; beam, 32½in.; depth, 10in.; and 3in. round of deck. The depth is three-quarters of an inch less than the Sapphire, but otherwise exactly similar. One is fitted with an Atwood board, the other has a box which the purchaser can have fitted with any weight of board he may prefer. Each is completely fitted with everything but sails, having deck tiller, foot steering gear, with wires under deck, Tredwen hatches, etc., etc. Both are finished with Spanish cedar deck, and the workmanship is as usual, first-class. We hope they will be purchased by members of the T. C. C.

Mr. Fred Mason, owner of the Whimbrel, has decided that in future he will take no one's dust, or spray rather, so he has ordered from Clindinning a new craft able to show her sternpost, either in sailing or paddling, to any Class IV. canoe in the club. Her dimensions will be 15×30, 9½ or 10in. deep, Child's board and Mohican mainsail. Hatches are to be similar to those described by Mr. Stephens in his new American cruising canoe design. Material, black walnut stem and sternpost, pine keel, oak timbers, planking white cedar, deck and upper streak of Spanish cedar. This new canoe will, no doubt, be a decided acquisition to the club.

The new commodore, Mr. Tyson, is said to be at work on a fan mainsail of such awful dimensions, that it is understood the holders of the different sailing cups will, as soon as they see it, hand over their trophies, without venturing to sail for them. Some of the members say the Isabel is to be fitted with a lead keel of several tons to enable her to carry her spread.

The skippers of the Sadie N. and the Evora are reported to be negotiating with a large cotton mill with a view to procuring enough of their product to make slightly larger sails. BOREAS.

NOTES FROM THE EXPOSITION.

Editor Forest and Stream:

I had hoped that I might have been prepared to send you some canoe items by this time, but I have been quite a busy man with one thing and another, and have not had time to collect them. However, I'll pick 'em up one of these days and send them along. Of course, I see our friend C. S. H. Buchanan frequently. As he is also an exhibitor, I run across him every day. Mr. Chas. P. Nichols, A. C. A., of Salem, Mass. C. C., is also here, and I have the pleasure of a chat with him quite frequently. I was pleasantly surprised a few days ago, by a call from Mr. J. A. Hepburn (A. C. A.), of Toledo, Ohio. We made a little cruise together through the various thoroughfares of this gigantic show. Of course, we talked canoe and canoeing, and at my suggestion he will go in heartily for the success of a meet at Ballast Island in July next. Com. C. K. Munroe made me a New Year's call at my anchorage, and we held a "camp-fire," while the wind outside the harbor was blowing a gale. The captain of the Psyche remained in the Crescent City but a few days, much to my disappointment. However, I am in hopes of seeing him again later on in the season. Yesterday A. M., as I was hanging about the space devoted to the exhibit of Rushton's canoes and the Child's board, Reade W. Bailey, the secretary of the Pittsburgh C. C., put in an appearance. I was not altogether unprepared for this visit, as I had received, a few days ago, a letter from him mailed at Memphis, Tenn., stating that he was making the trip down the river from the Smoky City to New Orleans in the pilot house of a towing steamer. Since my last sight of him (hanging his length up to windward in the Katrina, on Eel Bay) I doubt if he has added to his length "over all," but his "beam" has been spread to such an extent that he looks as though he was outside the limits. We canoed it for an hour or two in company, and then I gave him his course and left him. Toward night he rounded to and came to anchor at Post QQ, 47, of the main building, where I am to be found during the Exposition. Sorry that I could not have had a longer visit with him, but as the steam er was to return North to-day, he was forced to deny himself the pleasure of an extended trip through the Exposition. I have not had a chance to do any sailing yet, the weather has been altogether too disagreeable for a comfortable cruise. Haven't even got the sails rigged on the canoe yet. Have had two or three short paddles in the vicinity of the boat house, but like Rip Van Winkle's drinks, "they don't count." As soon as the weather gets settled, I propose to initiate two or three youngsters in the art of canoeing. I'll look around and send you some canoe items in my next.

With regards to all the paddlers,

NEW ORLEANS, Jan. 15, 1885. AURORA.

THE HUDSON RIVER MEET.

AFTER the courteous invitation of "Dominie," conveyed in your columns, it would seem to be the proper thing to decide upon Plum Point for the local meet next spring. So far as I can learn the New York and Hudson River canoeists are in favor of such a decision. Such of the "brethren" as may wish to combine cruise with meet, might do so by assembling at some point north of Newburgh, previously settled upon through the medium of your columns. One or two days could thus be devoted to cruising, and one or two days to the meet, thereby securing to all whichever plan may meet their wishes. I have no doubt that a small party of the Mohicans will make some such short cruise, and they would undoubtedly welcome the companionship of any of the "craft."

ALBANY, Jan. 21. ROBERT SHAW OLIVER, Com. A. C. A.

ELECTION OF OFFICERS.

Bayonne C. C.—Jan. 12. Commodore, Geo. W. Heard; Vice-Commodore, L. W. Burke; Secretary, F. B. Collins. The club has now ten active members.

St. Lawrence C. C.—Commodore, J. H. Rushton; Vice-Commodore, Will Kip; Secretary and Treasurer, F. W. Scribner; Measurer, J. W. Rushton. Thirteen members.

Buffalo C. C.—Election Jan. 7. Captain, F. E. Wood; Mate, R. W. Gilbert; Purser, C. P. Forbush. All communications should be addressed to C. P. Forbush, care D. L. & W. Express, Buffalo, N. Y.

Minneapolis C. C.—President, A. B. Taylor; Vice-President, E. H. Moulton: Treasurer, Geo. Harrison; Secretary, Samuel Hill. The club has lately been incorporated under the name of the Minnetonka Club.

Rondout C. C.—Election Jan. 20. Commodore, H. S. Crispell; Vice-Commodore, C. V. A. Decker; Secretary and Treasurer, Gilford Hasbrouck. Membership fourteen.

THE WESTERN CANOEISTS AND THE A. C. A.

I HAVE read with much interest the various communications on the subject of a Western meet. Let there be one, and a large one, by all means. So large, that at the A. C. A. annual meet next summer we may recoguize the fact that our Western brothers are a large and enterprising body, worthy of special recognition, and that an annual Western meet is to be a settled fact. Then it will be soon enough to carry out the idea of "L." in modified form for instance. Abolish office of rear-commodore and create three vice-commodores, who shall represent East, North and West. The special duties of these officers to be to preside at local meets in their neighborhood, organize them, and using their influence in popularizing them. No extra officers, in my opinion, are necessary, as one secretary can easily attend to all A. C. A. matters. Any assistance required by vice-commodores at local meets can readily be obtained by them. Let East, North and West send a good representation to the A. C. A. annual meet headed by the respective vice-commodores, and prepared to submit candidates for that office for ensuing year, and let the representation comprise the winners of local meet races if possible, and we shall add much to the emulation and interest in the A. C. A. contests. ROBERT SHAW OLIVER, Com. A. C. A.

ALBANY, Jan. 21.

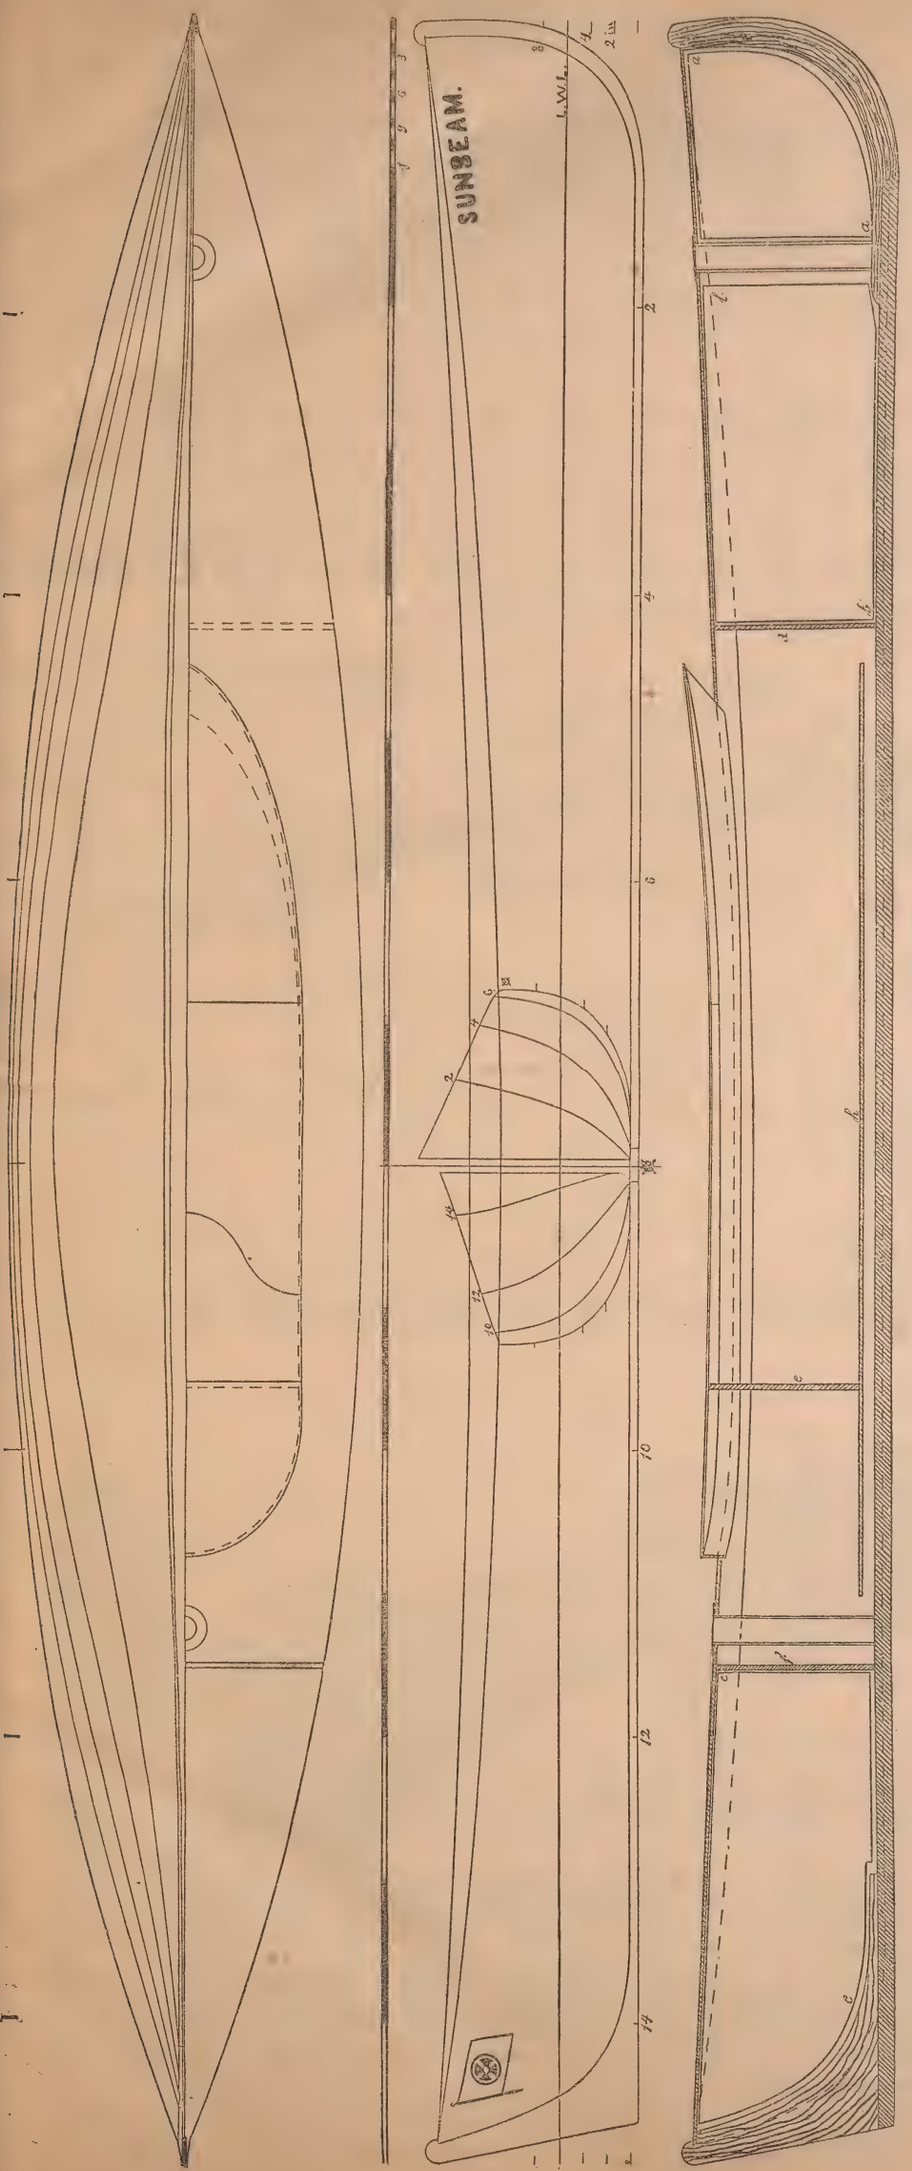
A CANOE CLUB IN BROOKLYN.

Editor Forest and Stream:

"Why has Brooklyn no canoe club?" is a conundrum that has been frequently propounded, but never very satisfactorily answered. There are quite a number of enthusiastic canoeists resident in the City of Churches, but they have either cast their lot with the New York or Knickerbocker clubs or have remained "unattached."

For those connected with either of the clubs the enjoyment of the sport has been at the expense of much lost time in going and returning, the New York club house being an hour and a half and the Knickerbocker club house even further distant from a majority of these members.

When we began to look into the matter seriously, and found that we had excellent water on the Brooklyn shore in the vicinity of Bay Ridge, where we could secure accommodations for a club house, and this within easy reach of our City Hall, our Western brothers and the long-talked-of Brooklyn C. C. A meeting was held on Jan. 12 at the residence of Mr. J. F. Newman, and our organization was completed, the founders of the club being R. J. Wilkin, J. F. Newman, J. H. Hull, M. V. Brokaw, Frederick Read, T. G. Budington, W. J. Root, H. R. Averill, Charles Gould and William Whitlock. The president of the Constitution Club kindly placed the rooms of that club at our service for our meetings, which we intend shall be held at least once a month.



It is freely admitted by rowing men that the popularity of the shell boat in this vicinity is sadly on the wane. There are also a great many men fond of sailing who do not feel that they care to maintain a large boat and a connection with one of the established yacht clubs. To these men the canoe will offer all the benefits of exercise as also the pleasures of sailing, and no doubt many of them will be glad to avail themselves of the advantages we shall offer.

We believe that from the sources mentioned, together with those gentlemen already interested in the sport, we shall be able eventually to recruit a good sized club, starting as we do with ten members, all canoe owners but one, and with a fleet of ten canoes. J. F. N.

INSURANCE OF CANOES AGAINST FIRE AND WATER.—Albany, Jan. 19, 1885.—The Continental Insurance Company, of the city of New York, has insured the canoes of the Mohican C. C. at the rate of two per cent., against fire and marine risks, subject to the legal averages. Its policy permits a canoe "to be employed in the general freighting business and to navigate the inland lakes, rivers and canals of the State of New York, the harbor of New York city, the East River, etc." A special clause in canoe insurance policies allows the owner of an insured canoe "to attend canoe meets and make excursions, provided no risky voyages are undertaken." Under "risky voyages" trips down Niagara Falls or across the Atlantic, round Cape Hatteras or Cape Horn are understood. Application for the insurance of a canoe in this company, whose general manager in this city of Albany tells me, he wrote the first canoe policy, must be made through the said general manager, Mr. Chas. H. Van Allen, 82 State street. His company are, however, not yet prepared or willing to insure the canoe of every applicant, because they consider it necessary, for their own interest, to have some satisfactory information concerning the applicant, who must be an A. C. A. man. The legal averages above referred to mean that according to the law for such cases provided, the canoe must have been injured at least one-eighth of one per cent. of its insured value before the company pays.—FERNOW.

LEFT THIS TIME.—A member of a certain canoe club, whose modest boast it is that they "seldom, if ever, get left," has devised a new scheme for the salvage of property in case of a capsize. He screws to one of his hatches a small reel on which is wound a fine strong line. Previous to capsizing, he makes fast to the end of his line his ballast bags, specie, frying pan, watch, and any other heavy articles. During a cruise last summer, an excellent opportunity occurred to test the new invention. A capsize indeed took place, and the programme was carried out to the letter. All heavy articles were made fast, the line paid out, and buoyed by the hatch. Next the canoeist succeeded in righting his boat, boarding her and bailing out, by which time help had arrived from the shore in the shape of a native in a rowboat, who kindly volunteered to pick up such articles as were floating about. When order was restored on board, the native pulled up alongside and restored the articles, including the hatch. "Hullo!" exclaimed the canoeist, "where are the rest of the things?" "What things," answered the native, "I ain't seen none." "Why, didn't you see a cord tied to that hatch?" "Ya'as, but I couldn't pull it in, so I cut it." The ingenious canoeist said a warm farewell to the native, and paddled on to the nearest point whence he could telegraph to New York for a submarine diver.

WATERPROOFING MIXTURE.—A correspondent sends the following: Boiled oil, one quart; soft soap, one ounce, and beeswax one ounce, the whole to be boiled until reduced to three-quarters of its quantity when mixed. The cloth treated with this mixture answers well for life-saving apparatus.—F. M. S.

15×30 CRUISING CANOE SUNBEAM.

SUNBEAM.

DURING the seven years that have elapsed since Mr. Everson built the first Shadow canoe for Ex-Com. Alden, he has built almost exclusively after that model, in some cases altering the length, and also improving the details to keep up with the practice of canoeists, but still retaining all the main features of the original Shadow.

One of Mr. Everson's best customers has been Mr. J. F. Newman, secretary of the New York C. C., who has had five Shadow canoes at various times. Mr. Newman, who is not a racing man, spends a portion of every summer in cruising, usually to or from the meets, and his camp outfit is noted as one of the most complete at any of them.

After several seasons in the Shadow, he decided that the model was capable of improvement in many respects, and after planning such a disposition of the space as experience had shown to be desirable, he explained to Mr. Everson wherein he considered the model deficient, and what he wished to obtain in a new boat, leaving to the latter all the details of designing and building the hull, with the result that the new canoe, now nearly completed, will no doubt prove as popular with the experienced canoeist of to-day as her predecessor was with the beginners seven years since.

This new craft, to which her owner has given the name Sunbeam, differs greatly from the older boat, the bow is less curved, no tumble home, less rake to sternpost, deeper amidships, while all the details of bulkheads, floorboards, stepping of mast, etc., are changed. The dimensions decided on by Mr. Newman were 15×30, with 11in. depth in place of 9½ in the Shadow, and although intended solely for cruising, the dimensions and lines are precisely the ones which promise to become popular under the new average rules for races, and we predict that the model will become as well-known as a prize winner as it will as a cruiser. The lines of the boat throughout are fairer than in the Shadow, the breadth on deck near the ends being greater especially aft, while the bow is very fine. The after body is a little fuller, the ends differing more than in the Shadow. The dimensions are:

	Feet.	Inches.
Length	15	00
Beam	2	6
Depth amidships		11
Sheer at bow 7in., at stern		5½
Crown of deck		2
Distance from foreside of stem to—		
Mainmast	1	8
Bulkhead	4	3
Fore end of well	4	10
After end of well	10	9
Sliding bulkhead	9	6
Mizzenmast	11	3
After bulkhead	11	6

Forward of the mainmast is a small sealed tank *a a* of sheet brass, filling the space in the bow. Aft of this is a tank of heavier brass, *b b*, opening by a metal hatch on deck, the details of which are not yet completed. This tank will be absolutely water-tight, offering a dry receptacle for stores, as well as security against sinkage, while abaft it is a wooden bulkhead.

The well will be 6ft.×19in., with a flaring coaming, the after portion being divided off by a sliding bulkhead *e* in the usual manner. In the well and under the floor *h* is a Child's centerboard, not shown in the drawing, the after end being 8ft. 5in. from the bow. Abaft the mizzen mast is another bulkhead, *f*, and still aft is another tank, *c c*, also opening from the deck with the same metal hatch as forward. This arrangement gives one sealed tank and two that can be effectually closed, as security against sinking, while the two larger ones give, with the other space below deck, ample room for storage of clothing and stores.

The masts are placed more in accordance with modern practice, the mainmast being but 20in. from bow instead of 3ft. 6in., as was once customary. The centerboard is not shown in the drawings, as the keel is suited for any style of board, Child's, Atwood, Crouch, or of the ordinary type. It is 1¼in. thick and 4in. wide inside, thus giving room for slot and trunk. The stem and stern are each sided 1in., planking (5 to a side) ¼in. thick, decks of Spanish cedar ¼in. thick, timbers ⅜×5-16in., spaced 9in.

The floor boards will be raised flush with the top of the trunk, to make a level floor for sleeping. The outfit and details will be as complete as in Mr. Newman's previous craft. The rig will consist of two balance lugs, although the Mohican sail will also be tried.

In beauty and fairness of lines, the Sunbeam is far ahead of her older sister, as well of the majority of canoes. With her deep midship section and good floor, coupled with her extra length, she should prove a fast paddler as well as a good sailer, and the model will no doubt be well represented on the average record of 1885. Since beginning the Sunbeam another has been ordered and nearly completed, and a third will be finished as soon as possible, to the order of a New York canoeist, to be used as a racing craft under A. C. A. rules.

CANOEING IN OREGON.—The Oneonta C. C., of Portland, Oregon, has had an addition to its fleet in the shape of a handsome Shadow canoe, built by an amateur, Mr. Will H. Walker, from the drawings and descriptions published in the FOREST AND STREAM. She is built of Port Orford white cedar, ribs, stem and frame of Eastern oak, and deck of Spanish cedar. Her name is Arline, and she will this year fly the Vice-Commodore's pennant of the Oneonta C. C.

NEWBURGH.—Mr. Smith writes that the ice is not yet safe on the river, but that as soon as it is he will lay out a new three mile triangle above Plum Point, and a half mile course.

THE A. C. A. FLAGSHIP.—Mr. Rushton is now finishing a 14x31 canoe for Commodore Oliver. She is of the Mohican No. 2 model, with 95ft. of sail.

CANOE MEETS IN 1885.—We have considerable correspondence on this subject, which lack of space compels us to lay over until next week.

GOLDEN STAR C. C.—The name of this club, given as Golden Saw in our issue of Jan. 15, should be as above.

CANINE CARRIERS.

A VERY common thing on all the Connecticut railroad lines is for accommodation train men to throw newspapers off the trains at or near the houses of subscribers living on the line of the road at a distance from the stations, says the Hartford *Times*. Frequently they are thrown overboard at a road crossing, perhaps a considerable distance away, but there are quite as many cases where a dexterous whirl from the platform sends the paper directly into the owner's yard, and he is saved a long walk, and in bad weather a disagreeabe one. In many instances dogs have been trained to watch for cars and get these papers, and country dogs, it is noticed, take quite an active interest in the affair. After yawning arouud all day with nothing more interesting than to bark at an occassional passing wagon, Towser must enjoy the approaching rumble of the train, the snatch at the paper as it comes whirling toward him, and the trot homeward burdened with news and responsibility. Over on the Naugatuck road some one has had the curiosity to inquire into this matter of dog messengers. Mr. Philip McLean, proprietor of the Gate House on the Thomaston road, has a dog who goes a mile and a half every morning to meet the train. The paper was formerly thrown off by the brakeman on the last car, and there the dog watched for it. Lately it has been thrown from the baggage car. The dog appeared angry at the change, barked furiously and waited sullenly for some time before going on his errand. He has not yet become reconciled to the new way of delivering his paper. Below Derby a dog has acted for several years as newsboy for a number of families. The papers are thrown out of the cars under full speed. Whether one or a large number of them, the dog is able to lug them off, making good time back. Another dog who has become a veteran as newsboy and cannot now, from age and rheumatism, get down to the cars, has in some way managed to trani a younger dog to do his work. Edward Osborne, residing below Naugatuck, has a dog who regularly meets the early morning train. The house is a mile away from the railroad, and the dog never leaves on his errand until he hears the train whistle at Beacon Falls station. Then he starts on a run and waits at the same spot always, with his nose poked between the panels of a fence, and his keen eyes watching for the flying paper. A story is told of one dog that was first taught to bring a certain New Haven paper, and when his master changed to another, could not be induced to carry the new one. This is unlikely. Another story is that the late Senator William Brown of Waterbury had a pet dog that could readily distinguish the whistles of the New England engines from those of the Naugatuck, though running on a parallel track at the same time, side by side. The faithful dog always found his train and car, and stood in waiting for the Hartford *Times*, which he carried home to his mater for many years.

DOG TRAINING;

—BY—

S. T. HAMMOND, KENNEL EDITOR OF FOREST AND STREAM.

FOR SALE AT THIS OFFICE PRICE $1.00.

Explanatory and Suggestive.

FOR THE CASUAL READER.

Arma virumque cano—"Arms and the man I sing." And, indeed, it would take the genius of a Virgil and the roll of Latin hexameters fitly to tell the deeds of this man, whose arms are shotgun and fishing rod. Go where you will, he is there. You run into him on the crowded city street, encounter him on cars and steamboats; he perches atop the country stage, bestrides the burro, and doubles up like a jacknife in the kanim. Seek out the most distant, most tortuous streams, his line has been wet in their waters; penetrate into the wilderness, the tin can of the sportsman's camp is yet further on. He goes for game—if the fates shall send anything within reach of his ammunition; for fish—if by good fortune a trout shall rise to his fly or descend to his worm. But, good luck or bad luck, game or no game, fish or no fish—fun always, fresh air, ozone, quicker pulse beat, brighter eye, more elastic step, all the multitudinous rewards, which, after all, outweigh the biggest "bags," and tip up the longest "strings." Is it not true that only a poet could tell his deeds as they ought to be told? Perhaps so. Perhaps not. He can usually tell them himself. And he does, with a thousand different pens, in a thousand different ways.

—You may read it in the FOREST AND STREAM.

And that is better than if it were put into verse between book covers.

One who does not understand these things might imagine that after being told so often, this story of the man—him with the rod and gun—might in the end become hackneyed. But it is not so. Why? Well for pretty much the same reason, we venture to say, that the fields themselves and the woods and the lakes and the streams never become hackneyed. However that may be, one thing is certain. Our columns every week, and month after month, give ample proof that there is still an abundance to tell of what is seen and what is done afield and on angling waters; and that hosts of people still delight to read the telling, our subscription books show with ever increasing emphasis. The FOREST AND STREAM is in the best sense

A Journal of Recreation.

It tells of the recreation found by busy men, in out-door, open-air life. It *is* recreation to these same men and to others. Explain it how you will, this recreation found in the pages of the FOREST AND STREAM is different from the diversion afforded by other papers. Why? Because (it may be answered again) the recreations of field and stream are always ten times more potent for good than are those found in almost any other way.

Look through the pages and you will see that the departments include a pretty large field. It is a wide scope of subjects. But if you look carefully you will see that the paper, from front cover to back cover is homogeneous. What is in it belongs in it. There is not the mistake of trying to foist upon the reader, who is interested in angling and shooting, a lot of stuff about horse racing or base ball or prize fights. There is no sawdust-ring odor. Everything is redolent of the woods. There are plenty of other papers devoted to the other subjects. If you are interested in them, you need hardly spend time to read the rest of this explanatory advertisement. The FOREST AND STREAM'S field is broad, but it is not broad enough to take in all creation. The editors are perfectly contented with the scope of the paper as it is at present. And now

A Word About 1885.

For fifty-two weeks of the year 1885 we propose to publish the FOREST AND STREAM, and to fill each number with the same rich abundance and variety of reading that may be found in this present number or in any one of the five hundred numbers that have gone before it.

There will be the same delightful accounts of the adventures and misadventures of the *Sportsman Tourist*, and whether the "tour" be across a continent or only across the pasture lot into the woods beyond, the story in either case will be well worth the time it takes to read it. We shall have, now and then, a description of such excursions in foreign lands, but for the most part these columns will deal with what is seen and done in our own country, for that, after all, is what the readers of FOREST AND STREAM are rightly presumed to be most interested in.

The *Natural History* columns will give attention to varied forms of animal life, more particularly such as may come under the observation of sportsmen in their rambles. This department of the FOREST AND STREAM we believe to hold a place altogether unique. It is neither the dime-museum sort of un-natural history affected by the newspapers, nor the abstruse, fine-spun and terribly dry lucubrations of the scientific associations. It is intelligent talk about animal life, intended for intelligent readers.

In the *Shooting* and *Angling* columns (we need hardly say it) will be accounts of hunting excursions and fishing trips—with luck, good, bad and indifferent; discussions about matters mechanical, ethical, sentimental, fanciful and practical; some, after much debating, will be settled; others will be left (and the reader with them) at the end just where they were at the beginning.

The *Kennel* will give in 1885 (as it has given in 1884) the earliest, most accurate and the only unbiased reports of shows and trials, and it will be the endeavor of the editors to maintain for the FOREST AND STREAM in this special branch the position it now holds away in advance of anything else published in this country.

The *Yachting* columns are in charge of an expert, whose highest ambition will be to keep these departments in the place already won for them in the recognized lead of journalism. Though the *Canoeing* interest of the country is of comparatively recent growth, the FOREST AND STREAM fully appreciating its importance, has provided for those who sail or paddle a (pretty generous) corner, which is so full of practical suggestions and recountings of cruising experiences, that a canoeist might almost as well try to get along without a paddle as without the paper in his mail every week.

In a word—this is what we started out to say—in 1885 the FOREST AND STREAM will be newsy, bright, wholesome—a journal of out-door recreation.

Terms:—$4 per year, $2 six mos., 10cts. per copy. Sold everywhere. Make orders payable,

FOREST AND STREAM PUB. CO., 39 Park Row, N. Y.

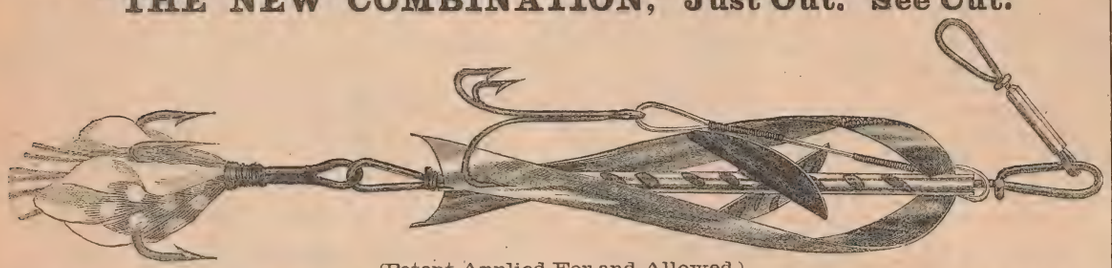
Whitney--Kennedy Repeating Rifle.

The Strongest and Best.



Many thousands in use. Greatly superior to any other Magazine Rifle yet made. The solid metal in line of fire at time of discharge renders the Kennedy ABSOLUTELY SAFE.

These rifles are made .38-cal. 40 gr., .44-cal. 40 gr., .45-cal. 60 gr., .45-cal. 75 gr., and .50-cal. 95 gr. (Express), using the same ammunition as other magazine rifles. Catalogues and price lists on application to the manufacturers.

WHITNEY ARMS CO., New Haven, Conn.

CHAPMAN'S BAITS STILL AHEAD!

"THE NEW COMBINATION," Just Out. See Cut.

(Patent Applied For and Allowed.)

In Three Sizes for PIKE, PICKEREL, BASS, TROUT & MUSCALONGE.

Read the Testimonials:

Chicago & Northwestern Railroad Depot, CHICAGO, Ill., Jan. 12, 1885.

W. D. Chapman & Son, Theresa, N. Y.:

As an old fisherman who has used your baits for the past twenty-five years, allow me to congratulate you on the success of your New Combination Bait for trout, muscalonge and bass.

It is very attractive, as the record of catches in Wisconsin last fall will show. I consider it the best bait in its different sizes made, and predict for it the largest sale of any bait ever made.

Yours truly, A. G. RYTHER.

Chicago & Northwestern Railroad Company, MILWAUKEE, Wis., Jan. 1, 1885.

W. D. Chapman & Son, Theresa, N. Y.:

I take pleasure in testifying to the great merits of your New Combination Muscalonge Bait.

I gave them a good trial the 1st of last November and caught thirteen muscalonge in two and one-half days' fishing, without the loss of a fish, and two of the thirteen weighed over twenty pounds each. You will have a large demand for these baits; sportsmen must have them.

Yours very truly, JOHN S. GEORGE.

To introduce these Baits at once, we will send by mail upon receipt of price:

No. 1.—Largest size, for Salmon, Trout and Muscalonge, $1.50. **No. 2.**—See cut, for Pickerel, Pike, Bass and Trout, $1.25.
No. 3.—Sure death to Bass, $1.00. All three sizes to one address, $3.50. **Try them at once.**

Catalogue and Price List to Dealers. Send Business Card. Catalogue to Sportsmen, without prices. 100 kinds of Baits.

MENTION THIS PAPER AND ADDRESS

For Sale.

FOR SALE.

The ever reliable river St. Marguerite, the chief tributary of the Saguenay, descending from a lake far north of Chicoutimi, and famous for its salmon and sea trout fisheries, with all the proprietor's riparian rights, is now offered for sale. The St. Marguerite is distant 15 miles from Tadousac by water, or 10 miles over land. The riparian rights cover a distance of 30 miles, which is sub-divided into six sections, 5 miles apart. At each section are erected one commodious Gothic cottage, men's house, ice house, etc., etc. Each section has the control of six to eight salmon pools. Parties desirous of forming a club to secure the rights of the above valuable salmon stream, can so arrange it whereby twenty-four rods could have equal rights and splendid sport. For further particulars apply to WILLIS RUSSELL, Proprietor, Quebec, Canada, or to Messrs. GRANT BROS., 2 Exchange Court, New York City. jan8,7t

FOR SALE.—A SELECTED COPY, FIRST IMpressions, of "The Game Fishes of America." Price $40. Address G. F. A., office Forest and Stream. jan29,2t

Trained Ferrets For Sale.

The finest rat and rabbit hunters in the world. Any size, weight or color. All thoroughly trained to the whistle. For sale at ADOLPH ISAACSEN'S, 92 Fulton street, N. Y. jan29,1t

For Sale Cheap.

Argus has been awarded prizes under the following judges:—John Davidson, Major J. M. Taylor, Harry Malcolm, James Watson, W. J. Munson.

Stud Fee, $25.00.

STUD FOX-TERRIER

Champion Raby Tyrant,

(K.C.S.B. 11,179.)

Pupped October, 1880. Weight 16½ pounds.

Raby Tyrant is a white dog, with an even marked rich black and tan head. He is a thoroughly game and stylish terrier, possessing a beautifully shaped long punishing head, with perfect drop ears, small eye, rare neck and shoulders, deep chest, well ribbed and muscular quarters, short, straight legs, excellent feet, great bone and substance, with an exceptionally hard and dense coat.

Raby Tyrant is without doubt one of the most successful terriers of the present day. He has been exhibited 67 times, 33 different judges having adjudicated upon him, and has won 47. First 10 cups and specials; 12 second and 2 third prizes. His breeding is undeniable, combining as he does the choicest and most valuable blood that can be obtained. At the stud Raby Tyrant is proving himself eminently successful.

Fee, $15.00.

JOHN E. THAYER, Hillside Kennels, Lancaster, Mass.

Scotland Kennel Collies.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. Newsdealers in the United Kingdom may order through Davies & Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, London, Eng.

ANSWERS TO CORRESPONDENTS.

FOREST FIRES.

THE question of preventing fires in the Adirondacks is curiously complicated by the over-production of coarse lumber, which for many years has been going on in Michigan, Wisconsin and Minnesota. While there remained in those States within reach of the mills a plenty of logs the business was very lucrative, especially to those who bought their standing timber at the absurdly cheap Government price, because the rapid settlement of the prairies and the exhaustion of the pine of the Eastern States made an almost limitless demand for good lumber. The tariff of $2 per thousand excluding, or greatly hindering, Canadian competition, the "pine barons" for a time had things their own way and waxed fat.

But they could not prevent others joining in this intoxicating hunt for the last pine tree, and so greatly were the number and capacity of competing mills increased, that even if there had been an inexhaustible supply of good logs, no available market could absorb the enormous supply. But as there was no such supply, before long good logs grew scarce; the quality and price ran down; and it was necessary to drive mills all the harder to make them pay. The recent invention of logging railroads—by which good trees growing so far from streams that they could not get them out with teams, are quickly and cheaply conveyed to the mills—has, it is true, helped for a time to keep up the quality. But of course, a forest exhausted by a method which reaches all the good trees in it, is more thoroughly denuded in the end. And even this device has not served to keep up the quality and prices.

The result has been that the market has been gorged with lumber, most of it so poor that it is not fit for anything except the coarsest uses, and is dear at any price. But after the good pine of the Adirondacks was exhausted, the poorer pine and the spruce and hemlock that remained had to compete with this flood of low-grade Western lumber, and yielded so little profit that the lumbermen of that region say that they cannot afford to remove the debris of logging. At the conference held last summer at Saratoga, between the Forest Commission appointed by the Comptroller, and the lumbermen, few of them would admit, although some did, the indisputable fact that this rubbish must be removed if fires are to be kept out. A similar effort to prove that two and two do not make four, was made at the meeting of the American Forestry Congress, held later in the season at the same place.

The increasing scarcity and value of good white pine may yet prove the salvation of the Adirondack woods. A competent German forester, Secretary Fernow, of the American Forestry Congress, asserts that in all the tracts which have not been burned over, good pine can easily be produced in abundance in place of the coarser conifers now found there, and that even most of the burned tracts on North Creek, if vigorously taken in hand at once, can be reclothed with valuable trees.

Good timber is certain to be scarce and high-priced. The State lands are interspersed all through those belonging to private parties. If scientific re-afforesting upon a scale large enough to be profitable were commenced on State lands, private proprietors might be led to adopt the same methods. In that case the North Woods would yield a permanent support to a large population, and at the same time afford the best of hunting, fishing and recreation to the increasing throngs of summer pilgrims.

GO TO THE SUPERVISORS.

IN New York State the Boards of County Supervisors have authority to make local regulations for the additional protection of game and fish. This authority is vested in them by Chapter 212, Law of 1879, as amended April 25, 1884. A correspondent suggests—and a most sensible suggestion it is—that those who desire changes in the game laws to suit their local needs, should go to the Supervisors for such changes instead of going to the Legislature. In numerous instances this has been done, and local laws have been secured, which might not have been granted at Albany.

Great bodies move slowly. It is much easier to put a measure through the Board of Supervisors than through the two chambers at Albany. Game law alterations are not there looked on with much favor. Game bills are neglected and lost sight of. Sometimes because of their multiplicity and contradictory provisions they are regarded as nuisances. The Senate and Assembly can be expected to know little of the local needs of the particular section a bill relates to. If the law is enacted at all it is a chance measure.

But the Supervisors can be made to understand just what is desired; they can hear and intelligently weigh the evidence for and against the measure; and they are presumed to be personally interested in the matter.

For local law go to the county Supervisors.

THE MICHIGAN SPARROW BILL.—Representative Barry's bill in the Michigan Legislature, which provides for the killing and extermination of the English sparrow, and removes protection from them, has passed the Committee of the Whole, and will undoubtedly become a law. These vermin have multiplied in enormous numbers in Michigan, until they have become an intolerable nuisance in the cities and are beginning to annoy the farmers not a little. The sentimental sympathy aroused by the resolution introduced by Mr. H. B. Roney in the Michigan Sportsmen's Association five or six years ago, which removed protection, provided extermination, and permitted sparrows to be shot from a trap, has given place to a more rational view of the question, as the nuisance has already assumed the proportions then predicted.

R. H. KEANE, known widely as an expert long-range shot and an enthusiastic rifleman, died on Saturday morning last, at the residence of a sister in Lexington, Ky. He was for some years prominent in connection with the small bore practice at Creedmoor, and as a director of the N. R. A. was always in favor of pushing the sport into popular appreciation. As president of the Amateur Rifle Club he sent several teams to Canada to meet the Hamilton long-range shooters. It was under his administration that the Bodine team was sent to Dollymount and there defeated the Irish riflemen for the last time in 1880. Mr. Keane was born in Arkansas in 1845, but for nearly twenty years past had made New York his residence.

THE NATIONAL ASSOCIATION, which has been talked of, will in all probability take shape at the International Clay-pigeon Tournament at New Orleans. Something of the plan and purpose of the proposed society is explained in our Trap columns; and our next issue will contain the complete draft of the constitution and by-laws.

A DEADLY UPAS TREE, under the branches of which the luckless traveler faints and dies, is the latest invention of the fellow who writes all the lies about Florida. That there are in this country great forests of trees, beneath whose blessed branches are to be found strength in place of weakness, health in place of sickness, and peace in place of pain, is no lie, but an every-day certain reality, tested by scores and hundreds. And while the sensational newspaper editor is paying the Florida liar and his tribe to devise new upas horrors for the diseased appetites of his readers, the FOREST AND STREAM is week after week bearing its messages of the pines and balsams.

THE DOGS' RECORD.—Some months ago a correspondent proposed that the dogs should have a roll of honor, wherein should be written each canine golden deed. Last Thursday night, on Staten Island, a Newfoundland dog named Jumbo found a man overcome by the cold, summoned assistance and saved the man's life. Jumbo belongs to the Staten Island police force. On the same evening, in New York, a pet dog, Julia, gave a midnight fire alarm to her mistress, Mrs. Maria Pollard, widow of the historian, E. A. Pollard; and roused the tenants of a burning house just in time for them to escape.

WHO IS RESPONSIBLE?—The game dealers try to make it appear that they are obliged to sit supinely down on their own stalls and take all the game outside parties send to them. We have repeatedly said that it is quite within their power to stop the shipment of game to themselves whenever the stock on hand is as large as can be disposed of in the lawful season. It will be seen by reference to another column that this is precisely the view taken by so experienced a gentleman as Mr. Charles E. Whitehead, the counsel of the New York Association. It is the only common-sense view for any one to take.

SURE SUCCESS will crown the effort to get a non-hounding law in New York, provided each reader of this journal, resident in the State, will use his individual influence to that end We hear of letters written to Albany which have elicited favorable responses. Why should not every member of the Senate and every member of the Assembly receive from some one person or a number of persons in his district an expression of opinion on this topic?

NEW YORK STATE GAME PROTECTORS.—We have received several of the reports sent by the game protectors to the Fish Commission. They are valuable documents, inasmuch as they show the progress of the work and the state of public opinion. In our next issue we shall give an abstract of these documents.

"WELL, YOU SEE, I JUST WENT FOR HIM WITH A CLUB," as the valiant sportsman said, when he was telling an admiring audience how he killed his big buck in an Adirondack lake. The law ought so to be changed that such fellows cannot "go for" the swimming deer "with clubs."

LAWFUL TO SHOOT DOGS.—If the bill against hounding deer in the Adirondacks should be passed, a provision should be made declaring it lawful to shoot all dogs found chasing deer. The guides and Adirondack residents will see to it that such a measure if enforced.

MICHIGAN SPORTSMEN'S ASSOCIATION.—The annual meeting of the Michigan Sportsmen's Association at Lansing, which was to have been held last Tuesday, has been postponed to next Tuesday, Feb. 10, at 7 o'clock P. M.

THE PRESS OF THE STATE is very generally in favor of a law forbidding the hounding of deer in New York. See the newspaper comments on the FOREST AND STREAM petition.

CANADIAN SPORTSMEN are complaining because the Government leases marsh lands to private clubs instead of suitably providing game protection for the general public.

ROCHESTER, N. Y., has a humane sportsman who advocates hounding deer. He thinks that the bucks ought to be killed to prevent them from killing each other.

THE PETITIONS should be returned to this office at the earliest convenience of those who have them in charge.

STOP DEER HOUNDING, and at the same time many deer will be saved from the market-hunter's rifle and club.

THROUGH TWO-OCEAN PASS.

II.—LOOKING INTO THE CAÑON.

THE next morning two or three of the horses and mules were missing, which it took some little time to find, so the preparations for the start were by no means hurried. Ours was not the only party that had lost stock, and every few moments a rider would gallop up to the camp and inquire if we had seen such and such horses. When the train was nearly ready, Mr. Davis suggested that he and I should ride on ahead and catch some fish from the little stream on which we were to camp. The suggestion was accepted, and we were soon riding on a long, swinging lope up the East Fork of the Firehole River.

There were a goodly number of people in the Basin. Stages clattered along with their freight of Eastern tourists, bound for the Falls or the Lake, the slower but more comfortable wagons of the campers moved along in a leisurely fashion, and every now and then a little group of two or three horsemen with one or two pack animals would meet us, all bound for the wonderful Geyser Basins. For a few miles the road follows up the valley of the East Fork. In dry weather it is an excellent one, but after a rain the soft bottom becomes badly cut up by wagon wheels. The ascent on to the plateau, from which the drainage flows into the Yellowstone, is steep and hard for loaded teams, and in spring, when the snows are melting, must be very difficult. It lies through the green timber all the way, and the trees stand so close together that no view is to be had of the valley below. The plateau above is timbered, and as we approached an open spot we saw through the trees a pale, misty blue appearance of the atmosphere, almost like that made by a thin smoke rising from a partially burned out forest fire, but the bright blue sky above our heads showed no sign of smoke, and after riding a short distance further we suddenly passed out of the woods and were on the borders of Mary Lake, whose blue waters we had been watching through the tree trunks. It is a tiny lake, on the very crest of the mountain, surrounded by the timber, and without any outlet. Soon afterward we rode out into the open country, and although spending some little time in examining a number of hot sulphur springs near the road, reached Alum Creek not long after noon.

Following the stream up for about a mile, we tied our horses at the edge of the timber and set to work to catch some fish. The creek was but a foot or two in width, and flowed between banks two or three feet high, so that, with my nine-ounce rod, I was somewhat at a disadvantage, for it was impossible to cast in such a stream in the high wind that was blowing. Mr. Davis, however, with his young spruce tree, short line and grasshopper bait, was catching fish about as fast as he could bait his hook. Meanwhile, the elk gnats had gathered in force, and their persistence and ferocity almost drove me crazy. After walking a mile or two and only catching half a dozen fish, I ascended a point of bluff where there was a good breeze blowing, and the gnats would so be at a disadvantage, and here, in the shade of a noble pine, I sat for a while and enviously watched my more successful companion. Further up the stream, as I could see from here, were some old beaver dams and several pools of open water, where it would be possible to cast. Proceeding to these pools, I had some excellent fishing, though all the trout taken were little fellows, running from six to eight inches in length and weighing about five to the pound. From these pools I took twenty-eight fish in a short time, and then about 4 o'clock turned back toward the horses. In the meantime, Stewart, the chief packer, had come across the hill from the camp and wet his line. On reaching camp we found that Mr. Davis had eighty-seven fish, Stewart eighteen, and I had thirty-five; enough for at least two meals for the hungry company.

The camp was pleasantly situated on a level bit of grass, between the timbered hill behind and the swiftly-flowing stream in front, with a broad meadow near at hand, over which were scattered the feeding animals. About the cheerful camp-fire after dinner, we lounged and smoked and chatted, and discussed the plans for the morrow, until the crescent moon slowly sinking in the west, warned us that it was time to seek our blankets.

From our camp on Alum Creek to the Lake is sixteen miles, and to the Falls twelve. The latter were too near to be passed by. Long before the mules were packed, therefore, I started alone to visit them. The road is a good one, and passes along over the undulating sage brush prairie near a considerable group of hot springs, whose curiously colored waters, and trickling rills of steaming water constantly tempted one to stop and examine them.

The day was overcast and lowering, threatening rain. I regretted that it was not bright, for, remembering the wealth of coloring of the Cañon, I thought that it would be much more beautiful in the sunshine than in shadow.

Before reaching the Yellowstone River a number of streams are crossed, some of which have wide miry bottoms over which good corduroy roads have been built. On all these streams are to be seen places where camps have been made, old fire-places, and wooden picket pins still standing in the ground, and the ubiquitous tin can and beer bottle—painful evidences of civilization, from which at the present day it seems hopeless to attempt to escape.

Not long before reaching the river, Crater Hills, or as it was once called, Sulphur Mountain, was passed; a great barren white hill, full of hot springs and sulphur vents. About these last, much sulphur has been deposited, and many fragments of the bright yellow mineral are strewn over the ground. Once or twice I noticed where two or three blades of grass had fallen across one of the vents, and on their slender heads most delicate crystals of sulphur had collected. One of the largest springs is near, and just south, of the road at the foot of the hill. It is six or eight feet in diameter, and is almost constantly in a state of ebullition. The water was thrown sometimes to a height of eight or ten feet, not in jets, but by impulses from the center of the pool, so that the spray was sent outward in all directions.

The road down toward the Falls is a fairly good one, but not having been repaired for a year or more, was in some places in rather bad condition. Innumerable little springs trickle from the hillside above it, and where they cross the road make muddy places, which soon become what are aptly called "chuck holes." The time to work these roads is in the very early summer, after the snows have for the most part melted, and the freshets have accomplished their work of destruction. Repairs should be made then; that is, just before the travel in the Park begins, so that the tourist may pass over good roads. If the mending is done in the autumn, the water which falls in the spring destroys the repairs and leaves the roads in a condition but little better than if they had not been worked. The meagreness of the Congressional appropriations for the care of the Park and the late date at which these are available, has made it hitherto impracticable to repair the roads at the proper season of the year, but it is hoped that before long there will be a change for the better in this respect.

After following the river for two or three miles, the white tents of the Improvement Company are passed, and after climbing over the high hill beyond them, the roar of the Falls salutes the ear. At the base of the hill are seen the rapids which are just above the Upper Falls, and here the dark green river is patched with great dancing masses of snowy foam. The thunder of the rushing waters becomes louder, and a few moments' ride brings one to the Upper Falls. The mighty mass of dark water glides rather than plunges into the depths below, and is broken up into white foam and then spray just below the crest of the cataract. The height of the fall is one hundred and ten feet, and the clouds of white vapor which rise from its base obscure the view as one peers down into the abyss where the tossing, restless waters leap and whirl with a never ceasing motion. On the left rises the steep slope of the timbered mountain; on the right the more nearly vertical wall of the Grand Cañon of the Yellowstone, while before us are glimpses of the glories of that cañon.

Leaving the Upper Falls I followed the trail north along the river, and was soon opposite the Great Falls. These are 310 feet in height, and this, taken in connection with the tremendous volume of water which passes over them, renders the sight a most impressive one. Perhaps I cannot do better than to transcribe the graphic description of these falls by Colonel Wm. Ludlow, United States Engineers. He says:

"Close at hand, the river narrowed in its bed to a width of some seventy feet and with a depth of four or five feet, through the pure deep green of which the hardly wavering outlines of the brown boulders beneath are distinctly visible, springs to the crest with an intensity of motion that makes its clear depths fairly seem to quiver. Just before making the plunge, the stream is again contracted, and the waters are thrown in from both sides toward the center, so that two bold, rounded prominences or buttresses, as it were, are formed where green and white commingle. Lying prostrate, and looking down into the depth, with the cold breath of the Cañon fanning the face, one can see that these ribs continue downward, the whole mass of the fall gradually breaking into spray against the air, until lost in the vast cloud of vapor that hides its lowest third, and out of which comes up a mighty roar that shakes the hills and communicates a strange vibration to the nerves. From far below this cloud emerges a narrow, green ribbon, winding and twisting, in which the river is hardly recognizable, so dwarfed is it and creeping with so oily and sluggish a current, as though its fall had stunned it. On either hand, the walls of the Cañon curve back from the plunging torrent, and rise weltering with moisture to the level of the fall, again ascending 500 or 600 feet to the pine-fringed margin of the Cañon; pinnacles and towers projecting far into the space between, and seeming to overhang their bases."

But stupendous as is this mighty torrent, it is but one feature of the grand scene. A cañon a thousand feet deep and perhaps twice as wide, extends to the northward for miles. Its sides are curiously sculptured and carven into fantastic forms. Sometimes a vertical cliff supports a number of lofty cones of rock, ranged side by side upon some horizontal ledge along its face, or a narrow buttress may rise from the river's level in a series of pinnacles and turrets overtopping one another, until the summit of the Cañon wall is reached. Here that wall is so nearly perpendicular that it seems as though a stone dropped from the edge of the cliff would fall at once into the water of the river; there the decomposing rock has been eaten away above, until a soft talus rises half way to the top in a steep slope. But, after all, the glory of the Cañon is in its color. The walls glow with a vivid, intense radiance which is no less wonderful than beautiful. Browns and reds, and pinks and yellows, and delicate grays and pure white, have painted these hard rocks with a wealth and richness of coloring which cannot be described in words; and although I had imagined that I remembered the Cañon well, I was fairly startled by its majesty and its beauty of coloring, for the exquisite variety, delicacy and blending of the tints had passed from my mind. A general impression of the variety and brilliancy of the scene remained, but now looked upon again, it was a real surprise.

For hours I remained on the mountain-side, riding up and down the Cañon, and, from the top of one projecting rock pinnacle after another, contemplating the wonderful scene before me. On the other side of the river could be seen the level grass plateau, which represents the general level of the country, dotted here and there with groups of graceful pines; beyond in the distance were mountain peaks. The great gash cut in the earth at my feet and splashed with the multitude of colors, which glowed as the sunlight touched them, or when clouds obscured the sky, grew dull, stretched away north and south until lost in the bend of the river. At the foot of the Great Falls the sky was reflected in the mist which hung there, as if a bit of heaven's own azure had been brought down to earth to add to the beauty of the scene.

Far below my perch, on the summits of several of the rocky towers that had not yielded to the erosive effects of the air and water, were a number of ospreys' nests, and about them the birds still lingered, though their broods had long been gone. Hawks were perched on the nests, or on the rocks near at hand, while others, like black specks, sailed over the waters far below, or balanced themselves with half-opened wings on the dead pine trees that here and there clung to the sides of the Cañon. Now and then a bird would rise high in air above the water, and on motionless pinion, turning his head from side to side as he examined me with his keen eye, swing close by my seat, scrutinizing me closely to discover if possible who the stranger was. The little sparrow hawks too seemed to like the Cañon, and flitted about on nervous wing, and sometimes with a glass I could detect far below on the river's edge a dipper moving about with restless flight. Ever the dull roar of the cataract sounded in my ears, and mingled with its hollow murmur were the piercing melancholy screams of the fish hawks, reminding one of the sad, wailing cry of the sea gulls along the surf-beaten seashore.

[TO BE CONTINUED.]

TOPOGRAPHY OF THE YELLOWSTONE PARK.

WE stated last week the changes proposed to be made in the boundaries of the Yellowstone National Park, and urged upon Congress the importance of considering without delay the subject of the bill's passage. By a reference to the map of the region which we publish to-day, our readers can see just what those changes are and just how much is to be taken from and added to the Park. The light dotted lines running north and south and east and west, and meeting in the upper left hand corner of the map, are the north and west boundaries of the Park as it stands to-day, the heavily dotted lines just within these lighter ones are the north and west boundaries of the Territory of Wyoming. Should the bill now under consideration become a law, the western boundary of the Park will be the one hundred and eleventh meridian, the northern boundary will follow the forty-fifth parallel to the north bank of the Yellowstone River, thence it will follow the north or east bank of that river to the mouth of the East Fork of the Yellowstone, thence up the East Fork to the meridian of 110° 10', or about the mouth of Soda Butte Creek, and thence due east to the meridian of 109° 30'. From the point where this east and west line intersects the meridian of 109° 30', the eastern boundary runs due south to the parallel of 44°, thence due west along that parallel to its point of intersection with the meridian of 111°, and thence due north to the starting point. By following the lines indicated, as can readily be done on the map, each reader can see for himself just how the present reservation is to be modified. He will see, too, that so far as its natural wonders are concerned, it loses little or nothing by the reduction on the west and north, while the increase in size on the east and south adds to it a great deal of scenery that is incomparably grand and beautiful, besides taking in several groups of hot springs and the wonderful Two-Ocean Pass.

The greatest of all the advantages to be gained by the change is the addition of the considerable extent of forest land which protects the sources of the Yellowstone and the Snake River. No one can look upon this map without perceiving that the country which it covers is one abounding in water. Lakes, rivers, creeks, brooks and springs are innumerable here. Through the spring and early summer they collect and store up the moisture from the rains and melting snows—all the precipitation of this great region—and in summer and fall they give it forth again, to be carried on by the great rivers to fertilize the dry regions east and west of the mountains. The soil here is rich and black, composed of decaying vegetation, and forms a sponge which soaks up and holds the moisture, giving it forth gradually as it is needed.

Suppose, now, that this territory were to be denuded of its timbers. It matters little, so far as the final results are concerned, whether the destroying agent were fire, kindled through carelessness, or the axe of the lumberman. But suppose the timber gone, this would be the result: The

SKETCH MAP OF THE YELLOWSTONE NATIONAL PARK.

COMPILED FROM THE LATEST GOVERNMENT SURVEYS.

heavy rains in spring and the wash of the melting snows would, in a year or two, carry away all of the forest floor, which at present acts as a kind of reservoir for these waters, and deposit it in the stream beds, or in the lakes through which the streams flow. Thereafter, when the water fell, it would no longer be received by this sponge and held for a little while. It would fall upon the hard, dry mountain side, and at once rush down toward the main channel, swelling the river beyond its banks at one season of the year, while in a dry time its tributaries would carry no water and the main river would be reduced to half its present volume. This would be the beginning of the evil. How far it would go no one can tell; but if we may judge from the experience of European countries with certain streams, its results would be most lamentable. Certainly a stream which is beyond its banks for three months in the year, and half dry for the remainder, will not be of great benefit to a farmer who desires to use it for irrigation.

We have always regarded this question of forest preservation as the most important of those included in the subject of Park protection. It has a direct bearing on the prosperity of a very considerable section of our agricultural domain, and therefore deserves serious consideration and prompt attention.

The protection of the Western large game is a matter which deeply interests all sportsmen, and not less all those who have devoted any attention to natural history. The fate of the buffalo on the plains, of the moose in New York State and of the elk in the region between the Hudson River and the Mississippi, should teach us a lesson. It took but a few years to exterminate the buffalo, and unless a halt is speedily called, a few years more will see the elk as scarce as the buffalo is to-day.

It is a notorious fact that more or less hunting constantly goes on in the Park, notwithstanding the regulations prohibiting it. Last summer elk meat was sold openly there, and if any question was raised as to where it was killed, the seller would laughingly reply, "Oh, it came from the Hoodoo country," a region just without the Park. There is now in the country to be included in the Park an abundance of elk and deer—enough to stock the region and to keep it supplied for all time, if only they are efficiently protected. We have reason to believe also that there are a few bison within its borders, though it may be doubted whether there are enough of these to establish a permanent herd there. All these animals must be protected in the most stringent manner by a law which shall not only be such in name, but shall be rigidly enforced.

This bill for the protection of the Park should be passed at once. If it fails to become a law at this session, the work of protection will be delayed for a whole year. Next summer, when tourists go to the Park, those of them who are lawless can override the regulations as they have done in the past. They can kill game, smash down the geyser craters, and fire the forests; and in the absence of any forms of law, it will be impossible to punish them.

It is therefore a matter of great importance that the bill should at once be taken up and passed by the House. This done, it is believed—though we are without positive information on the subject—that Senator Vest will urge its passage by the Senate, and by prompt action on all hands the matter may be carried through. It is certain that if this is not done a great amount of destruction will be wrought during the coming summer. The bill is without objectionable features, is encountering no opposition, and is wholly outside of the domain of politics. It is simply a measure for the public good. Why shall it not be passed?

The Sportsman Tourist.

UNCLE LISHA'S SHOP.

VII.

AFTER the soft snowfall the grip of winter tightened with sharper weather, and it was a nipping night when Lisha's friends, the creaking of whose coming footsteps he heard twenty rods away, again entered the shop. Each as he came in made his way quickly to the ruddy, roaring stove, and hardly one failed to shrug his shoulders with a shivering "booh!" rub his hands, stamp his feet, and proclaim in some form or words that the night was cold, as if that was something which needed every man's testimony to establish as a fact.

Joseph Hill remarked, as he rubbed his ears, that "the skeeters bit." The inquirer stared at him and asked, "Bit who?" and said he hadn't "seen no skeeters sen September."

Another said, "Tell ye what, it's pretty cold," as if he was the original discoverer of this condition of the atmosphere.

Pelatiah asked Sam Lovel, "'s this col' 'nough for ye, Samwel?" and Sam answered as he fanned himself with his fur cap, "Cold 'nough? No. I want it cold 'nough to freeze the blaze of a match tew a pipe. I'm most melted, 'n' wish 't I could set top o' Tater Hill 'n hour er tew 'n' cool off." Pelatiah said "Sho!" and "guessed he was a jokin'."

Solon Briggs's opinion was that it was "congealous, and that the muckery would prawberbly condescend to twenty-four below jehu, I wou' say, below zeno, afore mornin'." And Antoine, hugging himself, declared that it was "bien froid," which, after Canuck fashion, he pronounced "ban fret," and then translated, "Col' lak a dev, bah gosh; more he was Canada, yas, sah." And so encouraging one another, they became firmly settled in the belief that the night was indeed a cold one, and Lisha, as he opened the stove door, using the corner of his apron for a holder, and fed the little demon a bellyful of white birch, gave it as his opinion, that "if the wind riz it would be a reg'lar rip snorter."

"And naow," said Solon, when Lisha had established himself in the polished leathern seat of his bench, "arfter the preluminary remarks 'at yew made at aour prevarious meetin', it is confidentially espected 'at yew will perceed to dilate your narrowtyve."

"Yas," Antoine urged, "you goin' fill up you promise, don't it, Onc' Lasha, hein?"

"Wal, boys, 'f I must I must. I s'pose," said Lisha, pulling hard at his pipe between words, "but I hain't no gret at tellin' stories. Ye see"—after some silent back tracking of memory—' 'twas 'baout Noer Chase; he was the fust one in taown 't hed a pleasure waggin, 'n' they uster call it Noer's Ark. He'd ben sellick man three fo' years, 'n' sot in the leegislatur' onct—cousin t' Jerushy, tew—'n' orter ben in better business 'n' goin' crustin', but he went, 'n' more 'n onct. So one March the' was the alfiredest crust 'n' he hedn't nothin' to dew much, 'n' s' he, 'I guess I'll hassome fun, s' he. So he got him a club, an' put on his snowshoes an' put 'er fer a basin up in the maountain where he knowed the' was some deer a yardin'. I know the ezack spot, an' so do you, Samwill. Right up where the east branch o' Stuuny brook heads. He got Amos Jones to go 'long with him, 'n' they got there an' faound the deer, twenty on 'em or more, a yardin' 'raound in the little spruces, 'n' all poorer 'n wood. Wal, they scahtered 'em aout an' went at 'em. Amos he seen Noer knock down ten on 'em and cut the' thruts, 'n' then he telled 'im for to stop, t' that was 'nough. But Noer he laughed 'n' said he was jis' beginnin' to hassome fun; 'n' then he put arter a doe that was heavy with fa'n, 'n' as he run up 'longside on her, she stumbled in the crust, her laigs all a bleedin', an' rolled up 'er eyes turrible pitiful tow-wards him, an' gin a beseechin' kind of a blaat. An' Amos he hollered aout to Noer t' let 'er 'lone, but Noer he on'y laughed 'n' said haow 't he was goin' ter kill tew to one shot, 'n' he gin 'er a lick on the head with his club 'fore Amos co'ld git tew him."

"Damn 'im!" growled Sam.

"Amos didn't hardly never cuss, but I s'pose he ripped aout then 'n' gin it to Noer hot 'n' heavy, 'n' said he was a good min' to sarve him 's he'd sarved the doe; 'n' jis then he happened to see that Noer was standin' 'long side o' the doe, right onderneath an onlucky tree, 'n' then he said he knowed suthin' 'ould happen tew him, 'n' tol' 'im so. But Noer on'y laughed at 'im, 'n' called 'im a sup'stitious chickin-hearted ole granny, an' took aout his knife to cut the doe's thrut. Amos couldn't stan' it to see no more sech murderin', 'n' so he cleared aout and went hum. Wal, Noer finished the doe, 'n' then took arter a yullin' buck next. The buck started daown the maountin', 'n' bein' putty light he skinned it 'long putty good jog, so 's 't Noer couldn't ketch up with 'im s' easy 's he hed with t'other ones. So Noer 'gin to git mad 'n' doubled his jumps, 'n' went tearin' daown hill lickerty split, 'n' hed mos' ketched up to the deer, when the toe of his snowshoe ketched int' the limb of a blowed doawn tree, an' he fell, kerlummux! 'n' struck his laig on another limb on 't an' broke his laig."

"Good!" cried Sam.

"His laig pained him onmassyfully, 'n' like 'nough he hurt his head tew, for he went inter a swound, I s'pose," continued Lisha, after nodding to Sam, "an' he lay quite a spell 'fore he come tew, 'n' 'twas mos' night. Fust thing, he tried to git up; but he couldn't make it aout till he got holt of a saplin' an' pulled hisself up, 'n' then he couldn't take a step. An' while he stood there a considerin', that 'ere doe appeared right afore him, lookin' at him jest as she did when he run her daown! He said, 'Shoo!' but she didn't stir a mite, and then he reached daown an' picked up his club an' hove it at 'er, 'n' he said it went through her jes' 's if she'd ben a puff o' smoke, an' went a scootin' over the crust twenty rods daown the hill, 'n' she never stirred! He tried to walk agin, but he couldn't step a step, an' then he goddaown on all fours an' crawled 's well 's he could towwards the clearin's, an' that ere doe kep allers jes' so fur ahead on him, allers lookin' at him jest as she did afore he knocked her in the head. An' when it begin to grow duskish the' was a wolf set up a yowlin' behind him as he snailed along a groanin' an' a sweatin' like a man a mowin', an' not goin' more 'n a rod in five minutes, 'n' then tew more wolves jined in a yowlin' so clus tew him 't his toes tickled, 'n' when he looked over his shoulder he could see the dum'd critters a shoolin' 'long arter him like black shadders, 'n' every naow 'n' then sittin' up on their rumps an' yowlin' for more to jine 'em. An' all the time that 'ere doe kep' jes' so fur ahead on him, allers a lookin' at him jes' so mournful. Bimebye arter dark, he got to the clearin' 'n' he couldn't go no furder, so he sot his back agin a tree 'n' sot there an' hollered with his club in his hand, for he'd picked it up in his crawlin', an' there he sot, 'n' there the wolves sot, an' right betwixt 'em stood the doe, which the wolves never took no more noticte on her 'n' of a shadder. Arter a while—seemed 's 'ough 't was a week t' Noer—somebody hearn the rumpus, wolves a yowlin' an' man a hollerin', an Aar'n Gove an' Moses Hanson 'n' mongst 'em, rallied aout an' went up an' faound him an' fetched him hum. They got a darkter an' sot his laig, but he was sick for three months, 'n' many a time, they said, he seen that 'ere doe a lookin' in 't the winder 'n' hearn the wolves a yowlin' raound the haouse, but the' could none o' the rest on 'em see her nor hear the wolves. Bimebye he got better, an' so 's 't he could git aout raound. An' then his son, the on'y one 't he had, went off t' the fur West a trappin' an' a tradin' for furs an' skins, an' got killed by Injins, an' then his oldest darter run away with a nigger, an' wus yit, his other darter married an Irishmun, an' wust of all, so Noer said, Amos Jones come up to see him, an' said, 'I tole yer so!' Then Noer got wus an' run int' the consumption, 'n' arter lingerin' an' lingerin', he died."

"All of which," said Sam Lovel, "sarved him right, and," lifting to his lips the broken handled pitcher of stale water that stood on a shelf in the corner, seldom replenished but never quite empty, "here's a hopesin' that all crusters may forever meet the same fate. Amen!"

"Haow long," put in the inquirer, "haow long did Noer Chase hev the consumption?"

"Ten year," Lisha replied.

"Was that all?" said the inquirer.

"I don't b'lieve," said Pelatiah, wiping his nose with his right hand mitten, "'at ever I'll crust hunt a deer 's long 's I live and breathe."

"I don't b'lieve ye will nuther," said Sam, "not in these parts, for ye won't hev the chance. But I wanter tell ye one thing, Peltier, the nex' wust thing to crustin' deer is snarin' patridges! One day in the fall I was huntin' up through yer father's woods, an' I come acrost a leetle low brush fence with snares sot in the gaps. I tore it all daown, an' one gret cock patridge 't I faound a hangin' by the neck I hove off int' the woods for the foxes t' eat. You sot them snares, Peltier, 'n' you hadn't ort t' done it. Every time I find any sech contraption, I'll spile it, no matter who sot it. 'Xceptin' ugly and mischevious critters 'at won't let ye hunt 'em no ways decent, give all God's creeturs a fair chance. Foller 'em up an' shoot 'em ef ye can, in the times 't they'd ort to be shot, but not no other times. Not no nestin' good birds nor breedin' an' sucklin' beasts that 's wuth a savin'. Then when ye die, 'f you've ben honest an' decent to folks, ye won't hev nothin' to torment ye. Naow, Peltier, you remember what I tell ye, an' don't ye never snare no more patridges, or less ye 'll hav an ole hen patridge a lookin' at ye jest as that 'ere doe did at Noer Chase."

"As true 's I live, Samwill, I won't never again."

"Ez for Noer Chase, which I remember him well as a consumptuous invalidge in the days of my youthful indolescense," Solon Briggs remarked; "it is my o-pinion that his fate was a just contribution for his predatorious onrightiousness."

"Wal, sah," said Antoine, who had long been waiting to put in a word, "dem Anglish offic'y in Canada when he go huntin' 'long wid Injin keel moose mos' same like Noel; fin' 'em in yard, run it daown, shoot it, carree off horn, litly bit meat, skin, maybe, leave it rest of it for wolf. Show horn, 'Horrah! Ah keel it moose!' Ah come porty near keel one of dat offic'y tam Papineau war, me wish ah have, bah gosh!"

"I've hear'd on it, Ann Twine. He chased ye an' you run, an' he follored till he putty nigh broke his wind. He run a narrer chance of his life, sartin."

"Ah, Onc' Lasha, who tole it you dat lies, hein?"

"I dunno 's I know, Uncle Lisher; seems 'ogh I did tew, but guess 't I don't," said Joseph Hill, "jes ezackly what an 'onlucky tree' is. Dunno but I did know onct, but I've kinder forgot."

"Wal," said Lisha, "what some calls an onlucky tree an' thinks is, is a sca'se kind of a tree, half way 'twixt a cat spruce an' a pitch pine. The leaves is longer 'n a spruce 'n' shorter 'n a pine, an' the branches grows scraggider 'n any spruce. They haint no size—never seen one more'n ten inches 't the butt. They haint no good, 'n' I d' know 's they be any hurt, but some folks thinks they be, an' you couldn't git 'em to go a-nigh one for nuthin'. Think if they dew the' 'll suthin' dreffful happen to 'em or some o' their folks. I p'sume the' haint nothin' of it. 'N' naow I guess it's 'baout time to shet up shop—an' maouths."

CAMP FLOTSAM.

XIII.—A SUMMER IDYL.

THE camp had reached a period in its existence when its inmates were inclined to let the sun beat them daily in rising by several hours, and when fairly aroused and fortified by a breakfast, nothing seemed further from their thoughts than fishing. One member set about the construction of a hammock, another in devising a sail for the boat; but taken altogether, there was more loafing than working. The dreams of many a winter's night, born amid storm and ice and sleet; dreams of summer isles, with shores of sand, and cliff and far in-running coves, of shimmering waters stretching far away, and vexed by no oar save our own; all these were realized, and we were content

> ——"to live and lie reclined
> On the hills, like gods together, careless of mankind."

The infusion of new blood was necessary to awaken the dormant energies of the camp. While everything was at loose ends the arrival of Truthful James at Battersea was announced by George late one night, and straightway the camp was in a tremor of excitement. In the early morning the discoverer of Loughborough stood on the bluff before the tents and received the greetings and welcome of the camp. It was on one of the early days of August, and he brought to us the first faint odors from the campaign in the States, the full essence of which saluted the public nostril a few weeks later. But the bundle of rods and the tackle box beside him indicated the barrier which he had placed between himself and principalities and powers, office present or office to come.

> "So Scipio to the soft Cumæan shore
> Retiring, tasted joy he never knew before."

An angler who had cast over many waters, skilled in all that pertains to the craft, a sharer in all of its enthusiasms, in a few moments he roused the camp from its lethargy and saw the last symptoms of its fever vanish, and thenceforward found it ready at all times to enter the lists with him in generous rivalry. A short cruise on the morning of his arrival was taken and we were rewarded with a dozen small-mouths, after which, while stretched in comfort on the banks, we listened to news a month old and gravely passed judgment on the affairs of two continents. Next the details of a vigorous campaign were perfected, and Sabattis was interviewed and himself and boat engaged for the benefit of the newcomer.

Truthful James brought with him much besides the gentle patience and accomplishments of the angler. Through the long noonings were woven webs traced with the pencils, chisels and pens of those who have painted and carved and sung for us of the later time, and with whose colorings and forms he reared a new world, one that could neither be drowned by flood nor destroyed by fire.

Early after breakfast on the morning succeeding his arrival we armed and made ready for the fray. The rays of the sun were scorching, and Truthful James, unused to the fiery exposure, improvised a muslin shield for the protection of his face. When he had finished it, with its two round holes for eyes, and donned it, he was a fearful sight. Across the border he would have been taken for a Ku-Klux, but here, one happening to encounter him and his guide in some lonely cove among the islands, would have fled terror-stricken, believing that he had met the infernal boatman of the Styx while transporting Hades-ward one of the damned.

When we set out Sabattis started to go around the island that his ghost-like master might cast over his favorite grounds of last year, while we turned directly up the lake, intending to work the point opposite Griffin Island until they should join us. When about half a mile from camp we found that the landing net had been left behind, and we turned back to get it. When we rounded the point we found that the other boat had made a circuit of the island and was ahead of us on the way up the lake. We followed and trolled with a gang of flies, with which we took now and then a lubberly big-mouth. While trolling through a narrow channel between a small rocky island and one of the large ones, the rod came near being snatched from our hands by the force of a strike which sent up a sheet of water some forty feet astern. The boat was put broadside on as a rush followed, and another sheet of water suddenly went skyward, when suddenly everything at the other end of the line came to a standstill. The boat was slowly backed and the line reeled in until we came to a stake which stood with its top a couple of feet below the surface, and around which a single loop had been deftly cast just where the leader was attached to the line, and beyond this there was—nothing. A twelve-foot leader, the flies and fish were each conspicuous by their absence.

Under such circumstances there are two things which ought always to be done. The first is to settle the weight of the fish; the other is to arrange a new gang. The former was satisfactorily accomplished by fixing the weight at four pounds and a half, but repairing damages was not such an easy matter, for upon setting about it we found that our fly-book had been left at camp. On such occasions there are several things, either of which it is proper to do. One is to criticise the action of the fish and your own stupidity, "according," as Sam Weller said, "to the taste of the speller." The unwritten work of the angler provides a ritual for such emergencies which is usually followed by the initiated. Fortunately a bucket of perch bait had been put in the boat before setting out, so there was no necessity for turning back. Slowly and sadly we followed the lead of the white mask, which, facing astern, looked like a death's head, grinning derision at our ill luck. Three miles further on we all came to anchor in Cady's Bay, under the shade of the well wooded cliff on its southern shore.

We were in for an old-fashioned fish, to sit down and watch the floating "bobbers" and to talk and dream between bites. The prospect was by no means unpleasant, and so with Truthful James close alongside on the starboard, we settled down to the enjoyment of our summer idyl. And it was an idyl. Somewhere from beyond the range of hills in front came the mellow tinkle of a cowbell, a few sheep were scrambling among the rocks on the hillside, while on the summit, starkly outlined against the sky, a horse was answering with his neighs to the call of his owner, a long drawn monotonous "c—o boy, c—o boy." No signs of human dwelling place were visible, but just below us, on the slope within the cove, a stone chimney and the ruins of a log barn told of a life lived here away from its kind. To such dwellers in these byways, wars and rumors of wars are naught, and whether the dominion be a colony, an empire, or a republic is to them a matter of indifference, though in some supreme hour they may help make food for powder in a cause waged by a master whom they know not, nor for what.

That day we lived over again our youth. The shadows drifted as of old across the water, which mirrored back the ghostly forms of birches and the somber pines; a muskrat was angling along the shore below, and a pair of squirrels were chattering in the trees above. The blue and green dragon fly poised in air and settled on our tips and floats with all his olden persistency, the wild bee hummed about us, while now and then the festive mosquito piped his song in our ears. We sat the long afternoon through, and until the croak of the frogs in the coves warned us of the supper hour, called back the memory of the homeward tramp across the pasture, through the swale and the open meadow to the farmhouse, with its cheery light gleaming through the open door, called up the vision of boyish hands holding aloft the string to now sainted mothers; of the welcome kiss, the royal supper, and—we lifted anchor and moved campward, a couple of graybeards, two boys once more. The fountain of youth is no vagary, though Ponce de Leon found it not.

The heart of Sabattis, too, was glad, for the day to him was a lucky one. We had taken fifty odd bass, and the household of the guide, the camp and the hamlet were well supplied with brain food. We made the five miles to camp in the red after glow of the Canadian sunset, which bathed the granite hillsides, the green islands and the water in the hues of the western sky. We shot into the long shadows at the landing, which were soon lighted up by the blaze of the camp-fire, and then, gathered about the range, we watched the frying of the fish and the bacon, the browning of the sliced potatoes, and the steaming of the coffee, until nature could endure it no longer, and we heaped them all upon the table and fell to. There was considerable dozing over pipes before we sought our blankets, and once within them, we heard not a sound until daylight.

The anticipated cloud of glory was beginning to gather over the camp. Before the week was out every one was surrounded with a halo, and there were indications of a fight for the front seat, when the sceptre unexpectedly passed into other hands. One morning while Truthful James with his boatman was trolling down the lake, the Madame, taking

George, started on a quest of her own. When she returned she was bearing a bass which weighed just five pounds, her only catch, but which she alone had played and landed. Stopping only long enough to display her trophy, she started off to the shoal at Garden Island, a half a mile away. In a few minutes we heard shout after shout across the water from the boat, and we knew that unusual sport was being had. Truthful James returned with a fine catch, but the boat at the island kept its place. It took repeated signals from the camp to bring it in, and when at last it came to the landing, there was a call for us to "come and weigh." There were fourteen small-mouths in the boat, and of these, two weighed three pounds and fourteen ounces apiece. This little episode put a quietus on the belligerent members who were striving for the lead, and as no one came up to the Madame's score during the camp, she was yielded the front seat.

By this time the achievements of the camp had gone abroad; they had crossed the border, skirted the North Woods and been wafted down the valleys of the Mohawk and the Hudson and through the "southern tier." In one of the counties of the latter they had set a lawyer and an editor agog, and the one, leaving "his quillets, his cases, his tenures and his tricks," and the other his "ads" and ems, started in search of the elysium where grew the golden fruit, determined to climb the tree and shake it. Two months of the campaign had converted the editor into a vessel of wrath, and he believed that the election of his candidate would usher in an era in which every week would have ten days, the pint measure hold a quart, "the three-hoop'd pot would have ten hoops, and it would be felony to drink small beer." He came to us charged with several conundrums concerning the tariff, revenue, wages and duty on the raw material. Illustrative of the latter, he brought some samples of the same in bottles—free of duty. The proper restoratives were applied, he was made to swear allegiance to the Queen and to limit his politics to discussions of the raw material aforesaid.

Thus all issues were happily pooled, and we heard no more of protection, prohibition, or the Tallapoosa, until the day when we set foot in the land which was suffering the infliction of listening to the pros and cons of the ins and outs—of plumed and plumeless knights, blatherskites and mugwumps.

WAWAYANDA.

RAMBLES THROUGH NEWFOUNDLAND.

VII.

FROM out a blinding snowstorm that had overtaken us in our passage of a tract of "barrens" and marshes, we had come into the shelter of a "var" (fir) forest where stood a cozy "tilt." Sheltered though we were by the densely branched fir trees of the "droke," yet the storm sung about us, and sometimes flung a large quantity of drift down by our camp. Every cove, every settlement in Newfoundland has its record of persons "lost in the drift." Around hundreds of miles of the inhabited coast there is no road, and in winter time no means of communication save by a foot path, which takes the traveler across dreary stretches of barrens upon which there is not a tree. Sometimes after he has set out the storm breaks upon him, but he believes that he will be able to keep the path, guided by poles stuck at intervals of three or four hundred yards along his way. But with a terrific wind and a blinding, smothering drift perhaps in your face, and in which you cannot see objects sometimes ten paces away, it will be seen that one of these poles becomes a difficult object to find; the poor traveler misses the path and loses the poles, wanders away in the overwhelming storm, till his strength fails him, and he falls down and perishes. I know personally of seven or eight such cases as these.

We removed the snow that had gathered about the squat little building, and presently the axes of the guide and the trader made a muffled ringing upon the whitings. For myself I was curious to see the inside of the domicile for sportsmen wayfarers, and creeping in observed, on striking a taper, two couches upon the floor, and one like a bunk midway along the further side of the camp. It must have been long since the camp had been used, for the fir branches forming the couches were gamboge instead of green, but would serve the excellent purpose of producing a quick fire.

While the rest were chopping down and "junking up" some of the gleaming whitings, I kindled a fire, but was nonplussed about water. We were very hungry, and it would take long for the snow to melt. The trader learnt the difficulty, and told me that "just there forninst the tilt, half a gunshot down, there's a first-rate little gully, a pure spring." Taking the kettle I went in search of the stream. I stumbled about among the trees for a minute or two without success, and then thought what a fool I was, as I certainly was, not to have put snow in the kettle and made an end of the matter. But "there's a destiny," etc.; that which I sought I found not, that which I did not seek I found, or rather I saw: to wit, upon a rampike with gnarled limbs a large flock of willow grouse sitting tamely as chickens, with their ruffled feathers, not five paces distant from me.

I forgot of course about the immediate demand for a meal, returned hastily to the camp, threw down the kettle, telling the trader to attend to it, and took my gun down toward the richly-laden rampike. I found the flock as I had left them, sitting with ruffled feathers, in mopish fashion, looking stupid as owls. The etiquette of sportsmanship which insists upon flushing the game, and that brands the shooting of a perched bird as murder was not strong enough to overcome my desire to "make a great show" of game before my companions, to whom the rules of sportsmanship seemed absurd wherever they departed from the utilitarian, the utility of all sport being to them to get meat. Therefore I began to do the murders. I knocked two down with my right barrel from their perch on the lowest limb. Then I knocked off another with the other barrel. My occupation now seemed to me to be about as honorable and as manly as to attack a human antagonist while he is sleeping. But I swallowed my remorse and recharged my piece, the birds sitting utterly regardless of my preparations, and supremely oblivious to the noise or the smell of the powder. I shall not, however, dwell on the discreditable scene. I shot them all; and the only gleam of respectability lent to my proceedings was the fact that a hawk came upon the scenes. He swooped and circled through the wood with vicious, glaring eye, wheeling round and round where I had committed the crimes. At last as he darted off, I suppose bidding the place good by, I shot him.

Just then, astounded by the sound of firing that I had perpetrated, the trader and the guide arrived breathless with their guns. The former, with his piece at full cock, in an excited manner asked: "Where are they?" I pointed to the pile of grouse, and to my proud, prone hawk, which every now and again would kick, flap one wing, and vomit his heart's blood upon the snow.

The number of dead, not the merit of the shooting, counting with these coast dwellers, they looked at me for a little while in mute admiration, and then the guide muttered to my cozy friend in the pea-jacket: "He's de best shot dat's ever come to dese parts."

Now we had some good cheese and deliciously smoked bacon, but I had too much the huntsman's instinct in me to be satisfied with the flesh of swine, palatable though it was, after many months in the chimney side soaking in the pungent, slightly acrid smoke of the fir and spruce; so two or three of the birds were prepared and set cooking for supper. That no discrepancy may seem in this fairly accurate record of my ramblings, I may state that the four grouse which we had brought campward from the rampike slaughter spot of the day before had tired the carrier, as he was otherwise heavily laden, and he buried them in the snow, certain, as he afterward told me, that we would find "all the meat we wanted" nearer the camp.

I was tired with my long tramp through the heavy snow, and hungry though I was, I drowsed before the spluttering, bright, breezy fire, while the meal was preparing. The mode of cooking was this: The trader took the iron ramrod from his musket and impaled the birds upon it. As the birds became brown and dry, particles of butter were dropped upon them, a tin plate being set underneath to receive the drippings. Salt and pepper were also applied, and in about three-quarters of an hour we had served up grilled grouse, which made as delicious a repast as ever gladdened a palate. I have always imagined in eating the willow grouse that I got the flavor of the hills and plains, and undoubtedly the flesh of this bird borrows a delicious tang from some of the browse buds and berries that it feeds upon.

Our camp was extremely comfortable. At the side where were our sleeping berths it was water-tight, but around where the rude chimney pierced the roof the melting snow upon the rafters dripped through. The chimney drew capitally, and we played "forty-fives," the only game of repute among the fishermen, for a couple of hours, the while we indulged mildly in the trader's excellent schnapps. While I think a little stimulant in the camp after a severe day's tramping makes retrospection and the whole situation delightful, I affirm that over-indulgence will demoralize, blur and make disappointing any expedition whatsoever. It is a great mistake, unless compelled by fatigue, or at the midday meal, to touch stimulants during the day while tramping. A glass of brandy in the morning while tramping will put me, so long as the effect lasts, into a state of abnormal ecstacy over everything I see about me; but when that fictitious lift fails, everything that so brief a time before transported, palls upon me, and I fall into the deeps of gloom. No; the stimulant is pernicious at such time, nor is such an agent needed to excite one's imagination, and increase his love for nature in the wilderness. Any man whose health is good and who has had a refreshing sleep in camp, finds on putting out upon his tramp in the morning no need for artificial stimulants. There is to him a joy in every bush and tree, a loveliness and an exhilaration in all things about him, and he enjoys the silent welcome that every hill and grove and stream seem to give him in a higher and more enduring degree than when wrought to exaggerated admiration and rhapsody by wine. The most delicious intoxication that I have ever felt is when a soft wind in the free wilderness blew upon me, filling my lungs and my veins with its impulse and bringing me tongueless messages from every inanimate thing.

After the forty-fives were played—I had overcome my sleepiness—I took "Masterman Ready" out of my bag, and straightway my companions, two of whom had never heard "a story out of a book afore," pressed me to read. I did so, omitting the portions that lacked movement, for I lost my hold upon my auditors the moment that I became prosy. But I did not read long; we were all tired, the book which they supposed would have something more astounding than Jack the Giant Killer did not prove interesting at all; so we were soon all snoring upon our couches of freshly-broken fir boughs, whose wholesome, balsamic perfume made a sort of incense not less delightful for the brain as one drifted off into the soft, smooth land of dreams than it did to the keen nostril.

In the night was heard the howl of a wolf near our camp as if looking for its companions. In the fresh snow a short distance from the tilt we found the tracks of a single wolf, which we judged to be that of the sorrowful straying. Our tramp lay through deep snow, through groves of dismal larch (juniper, as the rest called it), districts of spruce and fir, and sometimes through a "droke" of naked birches. We had snowshoes, or rackets, as my companions called them. Here and there upon the snow we found squat a flock of willow grouse, but I had to curb my passion for firing, as I was informed that we might at any time now come upon a flock of deer, and that they were so "yarry" that the sound would scare them off. But I was not to be suppressed in this way. I shot several pairs which I buried in the snow, though I had scant belief that I should ever fetch them away.

Our route lay across a land dip which formed a small river basin. Through this ran a black, deep stream, which seemed to get its first installment from under a hill that lay at its northern end. From a point where the stream banks were precipitous, we saw down in the dark water and below a projecting boulder, two animals which seemed like two old-fashioned dinner pots bottom up. I did not know what the animals were, but I was informed that they were otter. From behind a clump of firs which stood in nice range I fired at one as it was about landing. It crawled back immediately into the water, but I could see from its motives that it was wounded. My dog sprang down the precipice and plunged into the stream. Then I saw the water beaten about into foam from a struggle, and I was no little discomfited to see that my Cæsar was not getting the best of it. The poor brute was howling piteously, and as his head disappeared a second time under the water, I descended the bank to his rescue, but when I reached the bottom he had effected his liberation, and I found him bleeding upon the snow with a piece as large as a Mexican dollar bitten out of his neck. He had, I convinced myself, entered the fray with too little regard for the prowess of his barbarous adversary, and had set about "landing him" as he would a duck, and paid for his contempt and carelessness. I leveled at the wounded otter, which had in the meanwhile been endeavoring as rapidly as his wounds would permit to get out of sight, but while my finger was on the trigger, the trader asked me to fire carefully or I would "riddle her skin," and to "give it to him in the head." This I did, and the whilom pugilist floated past sodden and bleeding. We hooked the animal ashore with a stout fir pole, for Cæsar could not be induced again to grapple with an enemy of whom he had such painful recollections. The others complimented the trader on being a "first rate skinner," and in acknowledgment he took out his penknife, and very speedily divested the otter of his covering. I may as well add that I had the skin subsequently made into a cap and a pair of gloves. In the back of the right one I have often showed a hole, it was made by one of Cæsar's teeth.

We now set out for the main "deer lead" lying along the isthmus, connecting Avalon with the more bulky portion of the island. The native Newfoundland deer is the caribou or reindeer, a specimen superior to those of Lapland or Norway, and sometimes weighing as much as six hundred pounds. These deer inhabit the interior of the island not in hundreds but in thousands; some who have seen their armies in the marching season think in hundreds of thousands. The interior being a wilderness, they find no interruption save now and again—once in fifty years—when an explorer pushes his way across the region which through the summer they make their home. The marching time of the herds is as regular as the seasons. When snow covers the ground in the northwestern portion of the island, they turn their faces toward the south, and by steady marches along the leads, reach the southeastern or less severe part of the island, where through the winter months they can get browse and lichens. Some of those who have been camped near the main lead in the marching time have left on record that the deer do not move in very large bodies, for that would prevent them from being able to graze freely, but that they march in herds of from twenty to a couple of hundred, that one such body is connected with another by means of a sort of picket, and that each detachment is led by a tall stag. What a glorious sight for the huntsman from his eminence, to see body after body of these bright-eyed, nimble-footed animals, bending their course in true, parallel lines, either toward the north or the south, with the regularity and the order of masses of soldiers! Such a sight has often been seen. For days and for weeks this innumerable multitude has been seen passing along over sweeps of barren and sodden marsh, winding around the base of steep hills, and pausing for a few moments here and there to crop a mouthful of browse or mosses. In the summer they bring forth and rear their young along the shoulders of the airy uplands of the northern part of the island. They do not resort at this season to the best feeding grounds, probably to escape the mosquitoes, which are so numerous in the low-lying districts.

Although the interior of the island contains such numerous herds of deer, comparatively few are shot by the inhabitants who do not live near the passage ground. The herds do not come nearer than thirty miles of the coast, for they have learnt that there lives their enemy. This is a fact, strange enough, of which but few of the Newfoundland gunners seem to be aware. Hence winter after winter from nearly every settlement a party goes into the country for a deer-hunting expedition; but they seldom go more than twelve miles inland, hardly ever twenty. Sometimes a party of three or four get three or four deer, sometimes a half dozen; but in these later years they frequently do not even see a deer. The impression, therefore, is that "deer are getting scarcer," but they are really not. They are simply receding from the intruders with their old-fashioned, but deadly balls. There is, however, good reason why the gunners do not go far "into the country" for deer; all the game killed they must carry on their backs, and venison shouldered for thirty miles through heavy snow would be more than earned. It seems to me that it will some day, as it should have done long ago, occur to these coast dwellers that the reindeer may be trained to harness, as he is by the Norwegian and the Lap, and made to draw sledges to the resort ground of the herds. In Lapland the deer will draw 200-pounds weight, and his trotting speed is ten miles an hour, a rate which he can maintain for seven or eight hours. Harness two or three of these deer to as many sleds, and the hunter can drive with much fleetness to any point he may desire, and returning, bring a carcass upon his sled.

The herds that we were expecting to find were those which had passed from the north, in the fall, to the Peninsula of Avalon, and which would now commence their northward march. I do not think, though other writers whose opinions I much respect hold the opposite opinion, that any considerable proportion of the caribou in the island pass to the Avalon Peninsula in the fall, although I am satisfied that many thousands of them go there. The isthmus between the bottom of Placentia Bay and the opposite bay is not, I think, more than three miles wide, and parties of deer stalkers have frequently posted themselves by all the leads during the marching season. Their testimony as to the number passing up and down ought to be conclusive, and they having seen nothing like the numbers that others have observed on the march further north, where only a few of the parallel leads could be kept in view.

It was the expectation of the trader that after the storm was over, fine weather would follow, and as we went along upon our snowshoes the snow-laden branches of the trees dripped merrily. "This sort of weather will turn their heads to the norrid," he observed as he looked out on the soft, cobalt-colored sky. "Sometimes, howsomever, they get out o' their reckoning. I have often seen flocks turn back toward the sou'west when the weather was hard and the snow deep. One fine day in these parts doesn't make a spring. But the soft weather has set in this time, and there'll be rain yet afore midnight." He seemed to have gathered the latter belief from the fact that troops of jays appeared along the edge of the "tucks" by which our route lay, and were so tame that I struck one with the muzzle of my gun.

Having left the ridges we made through a low-lying tract in the direction of our tilt, being wearied with the day's tramping, and not in the best of spirits at having failed to see any deer. "Here's a hare's footin's," said one of the party pointing to fresh tracks leading around a clump of crooked scrub fir about an acre in area. I was anxious to shoot an Arctic hare, so I made ready. "A starn chase is a long chase," the trader remarked as he saw me go off. I inquired what he meant, but he simply said, "Wait till we see if he begins to double on you." There was just the single track in the snow when I set out around the clump. I made rapid speed, but could see no sign of the game, although the others, who were now abroad over the marshes after grouse, had assured me that it was not in the bush. Presently I discovered two tracks, and when I had made another circuit of the bush I saw a third. Then I turned around and said, "I shall meet you my lad," but never a glimpse did I catch. I found a fourth track now but it was

going the opposite way. I then concluded that the Arctic hare has not ears for nothing; that he must have heard me coming rather than seen me, and turned when satisfied of my proximity. I then stood for a moment resolving some method of circumventing the wily game, and I thought of a plan, very simple. I took out the ramrod of my gun, stuck it in the snow by the hare's tracks and hung my crimson comforter upon it. "That will make no noise," I chuckled to myself, "and it will be a sight for this unsophisticated animal. So I set out again, and when I had nearly completed my circuit moved cautiously. Presently this unseeable thing that had been making the footprints was in sight, about twenty yards distant, sitting upon its haunches, and with ears thrust out looking with all the intentness and wonderment of its nature upon the ramrod and the crimson scarf. "Hallo, sir," I said, as I presented. He made a quick motion, and was on the spring into covert when I lodged the load, which had so long been hungering for him, into his side. I carried away my prize with as much pride and pleasure as if it had been the head of the proudest stag in the wilderness.

When my companions left me engaged in the "starn chase," they thought I would have continued till overpowered with disgust. "How did you get him?" they asked in surprise. "Why, I traveled round and round for a time without seeing him, then I knew that it was simply a question of speed between us, and judging that I could run the faster of the two, I set out at top speed. After three circuits I ran him down, and shot him as, in a state of exhaustion, he was trying to crawl under the bushes." They swallowed the story, and looked upon me as a sort of dare devil prodigy. I may say that if the townsman find an invariable freshness in the rustic, the rustic is also sure either to find or to look for a greenness of a certain kind in the citizen. Ignorance of certain facts, which are known to him by experience, or gathered from the experience of others, stamps the incomer with the dandy clothes and fine linen as a legitimate subject for quiet fun. If the citizen can good-naturedly turn the tables, he becomes a hero; if he cannot, he will always be regarded as a legitimate subject for a certain species of their wit and cleverness. Had I come away exhausted from the hare chase, they would have laughed and jibed me compassionately. This was a new way of getting the game, and they simply looked with distended eyes while I told my lie. It was not till the next morning that I stated the fact, when they all felt and looked defeated and ashamed. I had, very naturally, adopted the obvious expedient, and it was the same as they would have adopted; but they had reserved the information for my benefit till after my defeat had been assured. J. W. Collins.

Natural History.

HORNS OF THE FEMALE CARIBOU.

Editor Forest and Stream:

Owing to my absence from the city, I have only just read Mr. Chamberlain's letter, published in your issue of the 8th inst. I am sure that Mr. Chamberlain and I are both anxious only to get at the truth of the interesting question brought up by this discussion, and the best way to do this is to collect all the authorities on the subject, and after this has been done to take what testimony we can from the trustworthy caribou hunters of to-day. I notice the references given by Mr. Chamberlain in his last letter, and can only add to them two or three, namely: Griffith's "Cuvier's Animal Kingdom," Vol. V., p. 304; Brook's "Proceedings Zoological Society, London," p. 927. To these two I have been unable to refer directly, but through the kindness of my friend, Mr. Frank J. Thompson, I can give one or two extracts from the "Sportsman and Naturalist in Canada," by Major W. Ross King, Unattached, F.R.G.S., F.S.A.S., etc., London, 1866. In his preface he says: "During a sojourn in these regions, extending over a period of three years, constantly rod in hand or roaming the woods with dog and gun, I habitually recorded in my note book memoranda on the haunts and habits of the birds and animals which I have endeavored to describe in the succeeding pages," etc. And further on in Chapter IV. (Ruminantia, continued):

"The caribou of Canada (*Cervus tarandus*, var. *caribou*) is not to be confounded with the smaller variety (*grænlandicus*), which inhabits the more northern regions lying between the sixty-fifth degree of latitude and the coast of the Arctic Sea, and is an equally distinct variety of the typical reindeer (*Cervus tarandus*) of the old world."

"Partly palmated and partly cylindrical, the caribou antlers are of singular and fantastic form, and though of great expanse—apparently ill-adapted for a forest life—are so slight that their weight seldom exceeds nine pounds. [Here an excellent cut of the head and antlers is inserted.]

"The stem of the horn is considerably curved, the concave side being to the front, and the extremities of the palmated brow antlers project nearly fifteen inches over the face. Sometimes only one of these brow-antlers occurs on one or other of the horns, though they are more frequently present on both, especially in the case of the older males; and it is doubtless their peculiarity of form which has led to the belief that they are intended by nature for the purpose of removing the snows of winter in search of food. The fact, however, that the male animal sheds his horns about the commencement of that season demolishes the theory in his case; and it is well known that he uses for this purpose his forefeet and muzzle only, the skin of which latter is exceedingly hard and tough. It is a singular fact that the female of this species is furnished with antlers as well as the male, and equally curious that while the latter shed their horns, as just mentioned, at the beginning of winter, she should retain hers until the spring. If for the purpose of enabling her to procure food as above, in the winter, we may ask why should she be provided with facilities for such a purpose which are denied to the opposite sex?"

This statement, it will be observed, is quite definite. Mr. Thompson has also given me an account of a pair of caribou, male and female, which for a year were under his charge at the Philadelphia Zoological Gardens. Of these, the female had horns, and there is no question about the sex of the two animals, for a critical examination was made in order that they might be correctly registered on the books of the Garden. These books show that these caribou came from Maine.

In an article entitled "Caribou Hunting," originally published in the *Century Magazine*, and recently reprinted by the Century Co. in the superb volume "Sport with Gun and Rod," New York, 1883, p. 211, Mr. Charles C. Ward says: "Horns are common to both sexes, but the horns of the bucks are seldom carried later than the month of December, while the does carry theirs all winter," etc.; and further on he continues, "I have often studied their habits on the extensive caribou barrens between New River and the head of Lake Utopia, in Charlotte county, New Brunswick."

My position is this: The unanimous testimony of authors, several of whom have observed the caribou in New Brunswick, the locality now under discussion, is to the effect that the female caribou is usually provided with horns. This statement has been so often repeated that it has come to be considered as an established fact, and is referred to as well known, by most works on natural history and comparative anatomy. To overthrow this general belief, and to show that it is founded on error, even in any one locality, we may fairly demand that a large amount of indisputable testimony shall be brought forward to support the contrary view. For such evidence I shall wait.

That there may be such a geographical variation as is hinted at by Mr. Chamberlain, is possible, though, except for that gentleman's experience and the statements of the hunters and Indians whom he quotes, I see as yet no evidence of it. Something much more definite and conclusive than this is required before we can admit even the probability of so great a variation from the caribou of the Province of Quebec to those of the neighboring Province of New Brunswick.

Mr. Chamberlain inquires as to the personal knowledge had by Audubon and Bachman of this species. I find no distinct statements in their accounts of this species which bear directly on this point. It is remarked that during a certain trip to Labrador none of these animals were seen, and an account of their habits is given as having been detailed to the authors by Mr. Martyn, of Quebec. To my mind the inference drawn from the article is clear that the authors had but very slight, if any, personal knowledge of the species. Geo. Bird Grinnell.

New York, Jan. 30, 1885.

A correspondent well known to readers of Forest and Stream by his pseudonym "Corporal Lot Warfield," writes from Maine: "I have killed female caribou that were antlered, but have not found them as plenty as those without horns."

Editor Forest and Stream:

The inclosed letters may not be uninteresting to some of your numerous readers, who have seen the different opinions expressed in your columns for some time past regarding the matter of whether, as a rule, the female caribou have horns or not. From reading the answers to my inquiries among the well-known caribou hunters of Gaspé, you will see they all differ as to the proportion of hornless females. One should almost say, from these statements, that a female caribou without horns is the exception to the rule. Not being a caribou hunter, I make no comments, but simply send you the information I got through Joseph Eden, Esq., of Gaspé, who collected it for me; but I may add that I know all these hunters, and believe them to be reliable men, and their statements according to the extent of their experience.

Quebec, Jan. 24, 1885. J. U. Gregory.

Gaspe, Jan. 17, 1885.

J. U. Gregory, Esq., Quebec:

Dear Sir—In answer to your inquiry, in what proportion have I found female caribou with horns, I beg to say that I have hunted for over twenty-five years and have killed over one hundred and fifty, and found only about one out of fifteen female caribou that had no horns. William Eden.

Gaspé, Jan. 19, 1885.

J. U. Gregory, Esq., Quebec:

Dear Sir—In answer to an inquiry, in what proportion have I found female caribou with horns, I beg to say that I have hunted for over twenty-five years; I have killed about sixty caribou, have found only about one of twenty five without horns, and the females drop their horns in May, and the new horns begin to grow at once. Henry G. Patterson.

Gaspé Jan. 19, 1885.

J. U. Gregory, Esq., Quebec:

Dear Sir—In answer to your inquiry, in what proportion have I found female caribou with horns, I beg to say that I have hunted for over twenty-five years and have killed about one hundred and thirty caribou, and have found only one female in thirty without horns. The females drop their horns in May and the new horns begin to grow immediately afterward. Joseph Eden, Jr.

AS TO THE WHITE GOAT.

Editor Forest and Stream:

It is not at any time a pleasing undertaking to be obliged to call another person to account for an article written, no doubt, with the best intentions and from the best motives. In writing an article for a periodical of high class and large circulation like the *Century Magazine*, especially when the views expressed treat of matters interesting from a natural history point of view, great care should be exercised to make only such statements as are strictly accurate. This is doubly important when the statements made may become matters of record from which others may have to draw conclusions respecting some animal with which they personally may be wholly unacquainted. When such erroneous statements are made, therefore, I conceive it to be the duty of any one who recognizes manifest errors to promptly correct such misstatements, with the view of placing reliable information within the reach of those who are desirous of obtaining it.

Actuated by these motives, I am induced to offer a few remarks regarding *Aplocerus columbianus* Coues.

In the December number of the *Century Magazine* appears an article on "Hunting the Rocky Mountain Goat," by William Baillie-Grohman, which contains glaring inaccuracies, which are the more remarkable when we consider how long this species has been known and how widely it is distributed. Moreover, the species is one respecting which the fullest information may be had with a minimum of trouble and expense, provided the proper localities are visited.

This animal is more abundant in the coast ranges of Oregon, Washington Territory, British Columbia and Alaska than elsewhere, and throughout these ranges in British Columbia there can be procured at all or any of the various Indian camps as many goat skins as may be desired, and usually as many blankets made from the wool of this species as may be required. These blankets are still manufactured to a large extent by the older members of the Indian community, notwithstanding that the various tribes are well supplied with blankets of European and American manufacture by the Hudson's Bay Company and other traders.

To give an idea of the abundance of the white goat, it will be sufficient to state that an Indian of my acquaintance killed to his own rifle in two days the winter before last, sixty-five goats, and did so within a distance of sixty or seventy miles from this city.

The skins are of no special commercial value, selling at $1 to $1.50 each, and this price is no great inducement to Indians to hunt for them in a country where wages are so high as they are in British Columbia.

Very often these animals are caught while young, and when reared about a house become as tame, playful and mischievous as the traditional "pet sheep."

The habit of sitting on their haunches is a marked and well-known characteristic of this animal, but always, as far as I can learn, with the two forefeet resting on the ground. I question very much if they elevate their two forelegs as in the "position of a begging poodle," as related by Mr. Grohman, but as the testimony of one person who has seen a thing is of greater weight than a thousand who have not, I will let this pass.

Dogs are totally useless in pursuit of this animal, as they scale precipitous places and leap chasms where dogs could not follow, rendering the latter of no assistance in effecting their capture.

Mr. Grohman's statements respecting the size of this animal are probably at variance with facts; a fair average weight may be held to be 125 pounds. Very rarely do the largest bucks weigh 200 pounds, and the girth given as mentioned by Mr. G. as being 7 feet 3½ inches, is evidently a mistake, or the grossest possible error.

A work ox girthing 6 feet 6 inches is a fair average ox, one girthing 7 feet is a long way above the average, while one girthing 7 feet 3½ inches would dress from 800 to 1,000 pounds, and he would weigh alive from 1500 pounds to 1,600 pounds, in proportion as to whether he was fat or merely in good working condition. Now, how does this agree with the statement that the goat spoken of would weigh from 300 to 400 pounds, which, if even so, would not be such a big lift for "two powerful men."

That this species invariably lives above the timber line is not true. I saw one shot by a person sitting in a canoe, and the goat, when so shot and killed, fell into the salt water; and know of numbers of instances of them having been killed at very low altitudes. One was killed while swimming across Burrard Inlet only last summer, and the presence at high or low altitudes is governed greatly by the depth of snow.

With respect to the paucity of specimens in various museums, I am inclined to think that Mr. G. is misinformed, as I know of quite a number of specimens having been sent from this part of the world other than those mentioned in the article published in the *Century Magazine*.

J. C. Hughes.

New Westminster, British Columbia, Dec. 10, 1884.

[The American Museum of Natural History at Central Park has one or more individuals of this species on exhibition, and we know of four or five specimens in this city in private hands.]

THE BIRDS OF MICHIGAN.

BY DR. MORRIS GIBBS.

(*Continued.*)

6. *Merula migratoria* (Linn.) Sw. and Rich.—American robin, migratory thrush, robin redbreast.

We may well doubt if there is a bird on the American continent as dear to the hearts of her millions of inhabitants as the robin. A large majority even of our foreign population have a tender feeling for the robin, as it so often takes the place of home birds left years ago in foreign lands.

The children learn the name of the robin first of all, and soon recognize it by its happy song and bright breast, and the little ones look eagerly forward to the return of the robins and bluebirds, as dreary winter wears away and "freezing tempests back to Greenland ride."

What a strange spring we would consider it, if the robins did not appear. The papers announce their return; "the robins have come," is heralded from every quarter, and the words are on the lips of the joyous and happy; for we know that the vernal sun will bring forth the budding vegetation, and nature will wear her happiest May day smiles.

Few birds of North America have the geographical range of our familiar friend, extending almost throughout the entirety of the northern half of the Western Hemisphere; from the Atlantic to the Pacific and from Central America to the Arctic circle.

The migratory thrush, as it is appropriately called from its widespread peregrinations, is occasionally a winter resident in Michigan, although I cannot attest that it is ever a resident, though it is quite probable that a few remain every season in sheltering nooks, in the edges of deep woods, where living springs keep the earth perpetually soft. Such birds are from the north, having probably migrated to our State many hundreds of miles, while our own Michigan robins, which are last seen late in November, scurrying along hedgerows and in small thickets, are as far south as Kentucky at least, perhaps in Texas or in Yucatan. And while speaking of the robin as a resident, it may be proper to mention an uncertainty concerning the terms resident and winter resident, as regards other species well known as being found some seasons in winter, as well as summer. Of this class, the nuthatches, several species of woodpeckers, chickadees and many other familiar birds are examples. For instance, we see red-bellied woodpeckers throughout some winters, in fact they may be found nearly every season. But can we call these birds residents? For we must consider that the red-bellies which were with us during summer have left us, and those we find in the winter months came from the north. That those birds which are with us in summer go south at the time of regular migration, and their places are taken, partially, by recruits of the same species from the north, is well known, and I have repeatedly observed the change. However, the robin is a common species in Michigan during quite eight months of the year.

We first hear of the redbreast in the southern counties on their return migration in February, and the last ones are seen in the southern journey generally in the early part of December. I have seen stragglers repeatedly in January.

The migratory thrush is the first of the family to build its nest, and many nestlings have emerged from the beautiful blue eggs quite a week before the Wilson's and olive-backed thrush have invaded the State in any numbers. Some nests are found containing eggs by April 10, but such instances are extremely rare, the nesting season really not being at its height until May 10. From May 15 until July 20, fresh eggs may be taken in the accustomed haunts—which means everywhere—or young birds of all ages be found, from the nest-

ling of a day to the fully fledged recruit able to take care for itself.

Two broods are usually reared in a season, and perhaps three, but when we calculate the time for producing a bird able to take care for itself, and dating from May 1 as the period of incubation to begin, it is quite evident that in order to rear three broods in a season no time must be lost.

I have seen a parent bird feeding several voracious young recently ejected from the nest, while the mother was again setting on her second clutch of eggs. Such a case is rare, however, as the young are generally under the care of the old birds all of a week or ten days after leaving the nest, and the old pair rarely more than repair the nest until the young are disposed of. The robin is so well known that a lengthy article is almost out of place, but a few notes touching on the period of incubation may not be inappropriate. The following observations were taken during the past spring: "First egg laid May 1; May 2 two eggs; May 3, 1 P. M., three eggs in nest; May 4, 1 P. M., there are four eggs. Old bird begins to set steadily, although she has been on the nest over half the time since May 2; May 15 found two eggs and two young; May 16, 9 A. M., one egg and three young. This shows fairly that the eggs were incubated as soon as laid, or else that the time of incubation varies greatly even in the eggs of one clutch; May 16, 1 P. M., four young; May 29, 8 A. M., young all in nest; 1 P. M. young all out of nest, sitting around in the old apple tree and chirping loudly; May 30 could only find two young; June 1 could not find the young, undoubtedly killed by cats." The old birds were disconsolate for a few days, but at the end of a week began another nest in a maple near by, and all of twenty-five feet from the ground, quite three times the elevation of the first nest. The young appeared outside of the second nest July 13. At least ten weeks are occupied in building a nest and rearing two broods, which would bring the completion of the nesting season well into July, and although three broods are occasionally reared in a season, according to some writers, such a case has never come under my observation.

The nesting habits and structure of the nest are well-known. The boy, who, on being asked what the nest was composed of, replied "oh, everything," came very near the truth, for, with mud, principally used in its construction, are also agglutinated almost everything of a light nature that the female finds suitable to work into the structure, and rags, strings, paper, straw, grass and kitchen rubbish are often found; a nest in a city or village that does not contain rags or string being a rarity. In the rural districts, where such material is less liable to be found, a corresponding decrease in the various civilized materials is observed, and in deep woods, or fields, far from the habitation of man, only mud, grass, and occasionally leaves, are used. Twigs are rarely found in a nest.

The site selected is variable, and perhaps there is no bird which so freely adapts itself to circumstances. Some of the situations in which nests are found would indicate that the birds were almost indifferent as to location, and yet, after mating, some time is generally occupied in deciding on a location, nests frequently being abandoned after completion without apparent cause, and in some cases even when containing eggs.

Nests are frequently found under the eaves of houses and barns, as the swallows build; within buildings on sills and plates; in trees quite sixty feet from the ground; attached to cornstalks near the ground in a barren field; adhering to the roots of an overturned tree; in deserted woodpeckers' holes. But the most singular place was a nest found on a small stump one foot above the water in a millpond, and quite twenty feet from shore. A peculiar case is recorded of a pair building a nest in a freight car and depositing eggs therein. Finally when the car was moved the female maintained her position for some time till dislodged by a sudden jolt. Trees, bushes and rail fences are, however, the principal places where nests are found, which are placed from four to thirty feet from the ground.

Four eggs seems to be the regulation number, but often only three are found, and in extremely rare cases five eggs are laid. They are well known to almost every one, and are much admired for their beautiful blue color.

The female takes upon herself the principal duties attendant on the building of the nest, carrying most of the material, while the male superintends its construction. She also performs the greater part of the arduous task of incubation, only occasionally being relieved by her liege lord, who is generally trilling his characteristic and charming notes near at hand. If disturbed while on the nest, the female, resenting the liberty, boldly charges the intruder, and though rarely, if ever, using either bill or claw, the besieger may get a thump from a vigorous wing. The male, quickly on the spot, and frequently accompanied by other parent birds of the neighborhood, is even more fierce than his mate, and together such a chirping and flying about as they raise, if an unlucky schoolboy is the despoiler, he not unfrequently slinks away without the coveted blue treasures or callow young.

I have written quite fully of this bird because of its intimate relations with man, and trust the readers will pardon an apparent digression from the semi-scientific routine usually followed, in mere descriptions of birds and mammals, if I devote a few lines to the sentimental relations of our friend. I am aware that the relations existing between man and the lower animals is a topic of such general discussion that little need be said upon the subject; but such connection is generally based on the practical value of the so-called inferior animals to man, and it has undoubtedly occurred to many minds that some more intimate relation exists which does not depend wholly upon what we receive from the lower animals, either in the way of services rendered or gastronomic attributes. In this age of liberal thought, will it be improper to admit of associations existing, at least, between these æsthetic beings, winged gems of the air, and man?

It is a question which will bear discussion, and the profound sympathy which we nearly all feel for these "spoilt children of nature, the favorites of creation," as Figuier so beautifully calls them, will certainly cause us all to refrain from too suddenly crushing such an assumption.

We are principally attracted to the feathered tribe by the elegance of outward form, the beauty and diversity of plumage, sweetness and variety of song and grace of movement, and there are but few of 12,000 classified species, if any, which would not inspire our admiration in some way. Even the goose, so awkward and emblamatic, unfairly, of stupidity, appears graceful in the extreme when floating leisurely on the bosom of the mirrored lake.

As our emotional natures associate tunes heard in the dim past with events almost obliterated from memory, so we recall occurrences in childhood's hours associated with the songs of birds. Nothing can exceed the freshness of memories suggested by the simple song of the robin, and with thoughtful age, when the happy retrospection of perhaps four score of years is reached, how the incidents of childhood are retraced, ushered in by the casual hearing of some familiar notes by one of our feathered friends.

7. *Mimus polyglottus* (Linn.) Boie—Mocking bird.

This species being a straggler in our State, and only occasionally taken, is but little known as a Michigan bird. Many ornithologists consider those specimens secured within our boundaries as escaped cage birds. It is probably fair to admit the species in our list nevertheless, although we do not by any means agree with one list, in which the author states that the mocker is quite common in some of our counties.

Never having met with this remarkable vocal performer in the wild state, I can give no observations concerning it. A number of captures are recorded during the past twenty years.

[TO BE CONTINUED.]

IS IT THE SAME BIRD?

IT is three years ago last October since several white-throated sparrows made their appearance in a gully at the rear of my woodshed. No doubt they were attracted thither by the fine cover they found. This is full of blackberry bushes and ragweeds grown tall.

But the birds stayed on, and from time to time would show themselves round the place. I was particularly anxious that they should remain. They reminded me of my boyhood, and I took every pains to make my home attractive; consequently I baited them, and by the time the first snow fell they had become quite accustomed to look for their food in a certain locality. All I had to do then when winter set in was to sweep off the feeding bed and scatter some bread crumbs and wheat screenings about.

There were five of these sparrows then—two males and three females. Last year four came back, and three are here now. At least I suppose they are some of the same birds. Of one I think I am certain. These are the reasons of my assurance: Among the birds of 1883 was a male of very fine plumage. His size, color and markings almost led me at first to think that I was about to winter a white-crowned sparrow. He is here to-day, and has been off and on since the latter part of October; always disappearing when the weather is mild and there is no snow upon the ground, and returning again the day after the cold weather may set in. This has always been his habit too since I have had the pleasure of his acquaintance; and he always seems to be especially hungry on his return. This year he left me at New Year's, and did not come back till the 19th of the month, when a cold snap set in.

Now is he same bird that made his winter home here three years ago? We think that he is, and here are our more particular reasons for thinking so:

First, the bird that we have in mind, as I have said, was of large size and fine plumage, and so is this one. Then, he became quite tame during the snows and cold of last winter and the winter before, and this one is much more domestic in his habits than his two companions. Then, the bird of 1883 was accustomed to feed just under the kitchen window, and this bird is fond of feeding in the same place. Then, the bird that we speak of had a peculiar habit if any one came out of the door when he was feeding in the evening (and he feeds quite late, almost at dusk), of skulking along the ground, and looking over his shoulder at them, apparently being reluctant to take to wing, and the bird that is here now does the same thing. But it is the apparent fearlessness of the fellow at times that seems most convincing to me. When all other birds fly up from the feeding bed, juncos, song sparrows, English and tree sparrows, and even those of his own kind, he will look at me as I come in or go out just as though he knew me, and pick away, exhibiting scarcely a sign of fear.

This year he is accompanied by two females. Though it is plain to be seen that while he stuffs his own crop, he has a strong preference for one of his companions. As we have implied, neither of his companions are as tame as he is, while one is much tamer than the other.

All these birds keep more in company with the English sparrows than do any of my other birds. Or rather, the English sparrow seems to follow them to the feeding ground, while it is very evident that my friend considers himself the master of the flock. Perhaps the birds feed together from the fact that they all hide themselves in the same bushes, and have made their home in the same place.

But now, what of this bird? Is he not the one that came here on his way south three winters ago? What say the readers of FOREST AND STREAM who have some experience in drawing birds around their homes? A. H. G.

THE GOLDEN-WINGED WOODPECKER WINTERING IN MAINE.—A yellowhammer or flicker that has been inhabiting an icehouse at Fort Popham, near the mouth of the Kennebec River, was shot Jan. 14, 1885, and found to be in good flesh and plumage, with no evidence of any previous wounds. During December and January the weather has been alternately very mild and very cold. Evidently this bird had found a continuous supply of food, of which insects and larvæ probably formed a small proportion only.—EVERETT SMITH (Portland, Me.).

LIVE RUFFED GROUSE WANTED.—*Editor Forest and Stream:* Is there not some reader who has a single ruffed grouse in confinement which he would give, lend or sell for the purpose of aiding investigations looking to their domestication? These birds would be treated with the greatest care; if any gentleman has a single bird of either sex, he would confer a favor by addressing Lock Box 110, Toledo, Ohio.

HARPORHYNCHUS RUFUS WINTERING IN NEW JERSEY.—*Editor Forest and Stream:* I saw a brown thrush (*Turdus rufus*) to-day. Is not its appearance at this season very uncommon?—CHIP (Englewood, N. J., Jan. 18). [Quite so.]

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—Purchased—One jaguar (*Felis onca*), female; one brush turkey (*Talegalla lathami*); two Swainson's lorikeets (*Trichoglossus novæ hollandiæ*); eight undulated grass parrakeets (*Melopsittacus undulatus*); two pale-headed parrakeets (*Platycercus pallidiceps*); two scaly-breasted lorikeets (*Trichoglossus chlorolepidotus*); two Barraband's parrakeets (*Polytelis barrabandi*), and one bald eagle (*Haliaetus leucocephalus*). Presented—One screech owl (*Scops asio*); one summer duck (*Aix sponsa*), and one sparrow hawk (*Falco sparverius*). Born in the Garden—One great kangaroo (*Macropus giganteus*).

Game Bag and Gun.

REYNARD'S WAYS.

Editor Forest and Stream:

That's nothing to catch a fox asleep. These blunderers, who have stumbled on sleeping foxes and shot them, have only done by accident what an Allegany county man makes a business of. We have an old still-hunter here, our gunsmith, who says that he can kill more foxes without a dog than with one. Armed with a rifle and a field glass, and keeping to the windward, as in deer hunting, he carefully surveys the haunts of the game from a long distance, and finds them sleeping on logs, stumps, knolls, or other slight elevations. Then a careful stalk, a sure shot, and the brush is his. Here is a new form of sport. Deer-stalking is a thing of the past; but foxes are more plentiful than ever before, and more wily than buck or doe. It would be a triumph, indeed, to bag him in this manner, and every fox "downed" in winter means more birds in the fall.

A. STUBBE PENN.

FRIENDSHIP, New York.

Editor Forest and Stream:

Mr. L. C. Robinson of Derham started a fox and put him in his hole in less than ten minutes. The fox went directly through and on his coming out, Robinson gave him both barrels, missing him clean; the dog gave chase, and Robinson had just time enough to insert a shell, when the fox appeared at his hole again, Robinson fired and the fox was no more. Time of chase, fifteen minutes. G. H. M.

PORTLAND Me., Jan. 27

Editor Forest and Stream:

In your issue of 22d, "O.A.T." of Franklin Falls, N. H., seems to treat incredulously the idea of the fox taking a tree. On Thanksgiving Day of 1880, I met a countryman coming into town with a fox, which he had trapped the night before without injuring it. To buy the fox, call together a few friends, send for the dogs and adjourn across the river to the hills, was the work of only a few minutes. We gave him three-quarters of an hour the start and then slipped the dogs and proceeded to enjoy a splendid chase. After perhaps an hour and a half, Guess, (who, with Tan and Muse, you have heard of before) the leader of the pack, gave us the information, in which the others soon joined, that he had treed. We found his foxship in a thirty-foot pine tree, near the top, from which we proceeded to oust him and made him continue his run, holding the dogs till he again had a good start. I. C. L.

WILMINGTON, North Carolina.

Editor Forest and Stream:

On Friday, Jan. 30, several members of the Worcester "fur company" received a pleasant call from Mr. F. T. Gay and Mr. L. H. Sargent, of North Chelmsford, Mass. They made a short visit, all too short, not even giving us time to get up a fox hunt for their benefit. It resulted, however, in the purchase by Mr. Gay of Mr. John R. Thayer's famous foxhound Snap. This sale was the subject of general comment when the members of the company met at "Shattuck's" in the evening. The dog has the reputation of being one of the very best in this vicinity and the general verdict was that Mr. Gay had obtained a prize. Saturday, Jan. 31, Mr. John Slocum killed a fine cross gray fox, being the first fox of rare color killed by any of the company this season.

E. SPRAGUE KNOWLES.

WORCESTER, Mass., Jan. 31, 1885.

Editor Forest and Stream:

A correspondent, in your issue of January 8, mentions the fact of having shot a fox asleep on the top of a rock, and wants to know if any one ever had a like experience. This brings to mind a hunting incident which occurred to me several years ago, when living in Canada. At that time, and it may be so yet, it was the custom for the sportsmen of two of our neighboring towns, to pit themselves against each other in an annual hunt, the losing party to pay for a dinner for the sportsmen and the umpires, or counters of game. In this particular year, away back in the seventies, the usual challenge had been issued by the defeated side of the previous season, and a day appointed, and all preliminaries settled. The autumn was a cold and boisterous one, and the day appointed proved inauspicious. The hunt was postponed to a later date. That day also proved a bad one, and still another date was specified. On this day it was agreed that the hunt must come off, no postponement on account of weather.

The time came, and a worse day for a gun to be shouldered in quest of game never dawned. It was late in November, the ground was hard frozen, a very high wind was blowing, and occasional snow-squalls varied this pleasing picture. What kind of ground to choose for hunting over in such weather was a puzzle. I at last decided to spend my day in a dense swamp, which lay at some distance, thinking that I could have some degeee of personal comfort by being sheltered from the cold and cutting wind, and not be so likely to meet injury from falling trees and boughs, as in higher and more exposed grounds. My device proved a wise one, for I succeeded during the day in making quite a respectable bag—getting no less than nine ruffed grouse, two hares, and several red squirrels, besides the fox. The grouse were found near the edges of the swamp, into which they had penetrated in search of shelter.

Along in the afternoon I was working back through the center of the swamp, and directly against the wind. I had my dog at heel, and neither of us made the slightest sound as we walked over the mossy carpet which covered the ground, and which was also just whitened with snow. Suddenly, at a distance of some twenty-five yards, I spied a fox curled up and soundly sleeping under an upturned root of a fir tree. My dog saw, or scented him, as soon as I did, and crouched to the ground. I brought my gun to shoulder and then waited to see if reynard would become conscious of so deadly an enemy in such close quarters. But the roaring of the wind and its direction left his senses of smelling inoperative, and he lay so quiet that I did not know but he had been poisoned and died in that position. After waiting some seconds I advanced a few paces, still keeping him covered, and then squeaked loudly in imitation of a mouse (which sound will almost bring a dead fox to life), when he raised his head quietly and looked at me. I immediately gave him a charge of No. 6 right in the face, which rolled him over dead. Upon examination I found him to be a fine male, with a beautiful coat of fur and a magnificent brush. I felt very proud of my bag that night as I presented it for inspection to the umpires, as it nearly doubled in

count the next highest score, and it added zest to my appetite when helping to discuss the generous dinner which was again paid for by the party opposed to mine.

I did all my shooting in those days with a No. 16 Jo. Manton muzzleloader, weighing 7 pounds, such as I had upon the day in question. I always used No. 6 shot, 1 ounce with 2½ drams of powder. If I missed the game it was my fault. I have used all kinds of guns since that time, but have never had one that gave me as much solid satisfaction as that little Manton. Perhaps it was because I used it in the first of my manhood's days, when the blood pulsed stronger in my veins and everything in life gave more satisfaction. I have now settled down to the use of a No. 12 three-barreled Baker as the most useful, all-round gun. It is heavy enough for ducks and geese on our California plains, light enough for quail on the hillsides, and a handy gun in the higher sierras, where we need a barrel for a quail, another for a grouse, and the third for a deer or bear, all perhaps within a minute. But were I back again at the East, where one seldom meets with any game larger than a fox, I would return to a 16-bore gun. I am fully in accord with the opinions expressed by your correspondent "Cyrtonyx" on this same subject. With my old gun I always used 1 ounce of No. 6 shot and 2½ drams powder for small game; for ducks, 1⅛ ounces No. 4 shot and 2¾ drams powder; in fox hunting, before a hound, the same quantity of powder and 1⅛ ounces No. 1 shot. With that charge I have killed a large dog-fox dead in his tracks at 65 yards, and I have never done as well with a No. 10 bore, loaded with 5 drams of powder and the same amount of shot. I will try some of these long winter evenings to give you an account of a few trips into the high sierras which I have enjoyed in this State. AREFAR.

AUBURN, Cal.

Editor Forest and Stream:

I have from time to time noticed articles relative to the devices resorted to by the common red fox for the purpose of misleading hounds. An uncle, who was an ardent lover of hunting, once related an incident which happened during his career as a cross-country rider. The hills upon which he usually had a find are called Welsh Mountains, a chain running along the south side of Conestoga Valley, in Lancaster county, Pa. His hounds never failed to give tongue at a certain point on the mountain, and no amount of hard running forced the fox to earth, nor could the dogs gain one foot over a certain distance. This was rather perplexing, inasmuch as my uncle's strain of hounds was pure, staunch and fast. The hunts usually lasted from early dawn till night, at which time the dogs were called off. After several unsuccessful attempts to capture the fox, the old gentleman determined if possible to fathom the mystery. One morning he rode to the spot at which his hounds usually made a find, but before reaching the point his pack had started reynard and were off across the valley. He then carefully searched the ground over which his hounds had trailed. Upon coming to a small opening in the laurel thicket, he observed a fallen tree supported at the top by a few branches, these were sufficiently long to raise the end some ten feet from the earth, the larger end or butt being held by a few roots. He then, upon closer inspection, ascertained that it was hollow. He was about to thrust a long pole into it, but was deterred by the approaching cry of the dogs. He withdrew to the shelter of the surrounding bushes into which he had scarcely gone, when out of the copse opposite came the fox. Pausing a moment to assure himself that he was not observed, reynard sprang nimbly upon the fallen trunk and disappeared within it, and before my uncle had recovered from his surprise, out he popped at the smaller end, jumped to the ground, flirted his "brush" and cantered off as lively as though he had not already had a two hours' spin before the hounds.

The hounds came on, ran around the old tree, took the scent beyond, and were away without one moment's hesitation or fault. My uncle says: "I thought I had him then;" so he stopped the smaller end. While engaged in this he heard a scratching noise within the log, and looking in at the hole of entrance, was met by a fox retreating stern first. To say that he captured him at once is needless. After securing the animal he again hid in the friendly laurels. His patience was soon rewarded by the welcome music of his pack. Master reynard, following the tactics of number one, ran confidently into the log, only to be ignominiously hauled out, bound foot and mouth, and slung with his mate across the pommel of my uncle's saddle.

These foxes were evidently mates, and had baffled every hunter within miles by their combined cunning. One would lead the hounds a merry chase for one or two hours, then, when weary, return to the friendly hollow trunk to be relieved by its companion, thus setting at naught every effort to run either of them down or to earth. M. D.

BERKS COUNTY, Pa.

AN EPISODE.

ONE day, a friend and I were watching our dogs quartering a vast field hemmed in on three sides by a forest, with a tangle of Spanish bayonet, saw palmetto, brush, shrubs and vines skirting its edges and forming an almost impenetrable barrier, amid which the bright scarlet berries of the dogwood added a touch of color that brightened the whole. A faint haze hung over the landscape and supreme quiet reigned, for, besides ourselves and dogs, not a living thing was visible, save the omnipresent buzzard sailing in ever-widening circles overhead.

From the cotton field that had given us entrance to this place we had started three coveys of quail, each of which had contributed its quota to our pockets, and we anticipated some glorious sport before us, for we thought they would surely scatter in the broom grass, and give us plenty to do to take care of the singles and doubles. Rock made a grand point and was superbly backed by Dart, and as the birds flushed my friend dropped one with each barrel, but I had to be content with one. Bunching together, with never a swerve, the whole darted straight across, and rising above the underbrush, disappeared in the thickest part of the wood. The next covey the dogs found flushed wild, and without a turn or check followed exactly in the trail of the first. Ten minutes later the third covey was found, and repeated the same maneuver, save that I killed two crossing with my right, and wounded one straggler with my left, but the birds pursued exactly the same course, and disappeared over the same bush of dogwood that the others had.

This was becoming slightly monotonous, and when still another bunch vanished without the loss of a feather, our feelings were too deep for words. Back and forth, to and fro, we went, our dogs working grandly, but not another bird was found, and after another hour passed, I vowed that those birds would be found if it took me the rest of the day.

My companion had bruised himself by a fall, so I volunteered to try it alone, leaving him to watch the field and mark down the birds if they returned. Calling both dogs to heel, the first attempt to penetrate the thicket led to ignominious failure, but by dint of backing myself through the thorny vines, I found my course considerably easier, but often having to crawl close to the earth, which I did with many a quake, as a perfect horror of a snake has always possessed me that in vain I have tried to overcome, but as none were seen I breathed easier. Through vines and brush we took our way, the dogs crouched close to heel, until emerging from the tangle a little knoll showed itself as an opening, while far beyond, the open pine forest was stretching toward the Ashley. Hot and panting, with nerves all unstrung from my violent exertions, I leaned against a great live oak to rest, where the sunlight had found an opening overhead and rested on the little knoll.

Amid the vines and brush was a lonely grave shaded by massive oaks, whose moss-grown branches formed a sheltering veil, and whose sighing branches sung a constant requiem in the breeze.

A simple marble slab marked it, with this simple legend engraved:

TO OUR MAUMA.

This sign of love and devotion was a sermon in itself, as I gazed at this last resting place of one whose skin, though dark, was yet no bar to trust and love. From the boughs above came a low, throbbing song, and as when one in dreamland seems to hear the faint tinkle of bells, or the subdued rippling of the waves muffled and far off; so this sweet melody spoke to my heart through the minstrel of nature. Musing and thinking thus the dogs had been forgotten until a cold nose touched my hand and called me to myself.

Staunch as his name stood Rock beside the almost hidden mound, with every muscle drawn and tense; but as I stepped forward it was with lowered gun, and when with a mighty whizz and rush the coveys darted away, no roar of gun desecrated that peaceful spot, for, though loving sport with all my heart, to me it would have been sacrilege even to have attempted the life of a quail in that retreat. I returned to the fields and had most glorious sport, but the recollection of the shooting is less vivid than the picture of that lonely grave under the oaks of the Palmetto State. ONONDAGA.

GUNS, HAWKS, PRAIRIE DOGS, WELLS.

Editor Forest and Stream:

We are having a very rough spell of weather for these parts. For more than a month we have had a constant succession of wet northers, with only an occasional intermission of a bright, cheery, lovable day. In that time we have had two snows, and one of these is now resting upon us. The lowest point touched by the mercury—at least I have seen no lower—is 13° above zero. This is sharp business for this region, though there are men in Canada who, I presume, would think it was vernal breezes. Indeed there are probably men along the Hudson who would take it to be "Zephyr with Aurora maying." But I like to see this outrageous weather in Texas. An unusually cold, wet winter is to us a faithful prophet of a great crop year following, when we overflow with all manner of good things. Those are the years when we grow proud and scornful, and become liable to be led astray by the devil. I have an old friend who has lived in Texas nearly fifty years. He loves sporting and whisky, but is a very prudent and economical man. He never allows his expenses to overreach his income. When we have a mild, dry winter he never buys more than a gallon of whisky at a time, and that not oftener than once a month. During such winters that man must be very dear to him whom he will invite to drink with him at his house. When we have a cold, wet winter he buys a barrel at a time, and no man can enter his house and be allowed to leave before he is filled quite up to the stoppers. I had a letter from him yesterday inviting me to come down and stay a week with him, saying the deer, ducks and pigeons were so plentiful they had become saucy, and adding that he had just put in his cellar two barrels of whisky, one old Bourbon and the other sour mash, "of the vintage of '73." This shows his unbounded faith that we shall have great crops this year.

But I did not set out to write about the weather and the crops. I merely intended to write a little note or two about things suggested by reading the FOREST AND STREAM of the 15th by the bright red-oak fire. "Cyrtonix" says the best shotgun is that which needs bushing least; in other words, that the best is the smallest bore. That accords somewhat with my observation, and then it does not. The best gun I ever used was the first I ever used. It was an English-made, percussion lock, single-barrel gun, bore not less than 8 or 9, and it may have been larger. It was my father's gun. I have done some of the most extraordinary shooting with that shotgun that ever mortal did. A squirrel would find no tree so tall that I could not readily fetch him from its top. When out hunting with that gun I never asked how far the game was, but where it was. I saw my father kill a crane stone dead with it exactly 101 yards away, and I am sure I have often killed game with it a greater distance than that. The shot that killed the crane was not larger than 4's or 3's, and I rarely used larger than No 6, usually using No. 8. What seemed remarkable to me, and may seem so to some others, this gun did much better work with smaller shot than with larger ones, which latter she scattered too much. She was either 32 or 34 inches long; at all events she was a long gun as well as a big one. She had a stunning reputation in the neighborhood, and the boys used to allow me to brag about her without gainsaying anything.

But there was a preacher in that neighborhood who had a gun that was a stunner also. The first time I went hunting with that reverend man of God I couldn't help but laugh at him when I saw his artillery. It was a long gun, as light as a wisp, and had a bore that seemed no bigger than a dainty lady's little finger. It was a ridiculous little gun to me, but when I saw how the preacher knocked the squirrels from the tops of the biggest oaks in the bottoms, I gave it up that his little thing was a whale next in order to my own, and ever afterward I looked upon it with profound respect, which, as my acquaintance with it grew, almost turned into a superstition. The rascally little gun could wipe down the game just as far as mine could and did it with half the fuss. The idea got into the heads of us boys that the ridiculous little gun behaved so admirably simply because it was the property of a preacher, and not from any inherent virtues of its own. The letter of "Cyrtonix" leads me to believe that the gun did so well from its own internal virtues.

The preacher's gun was also a single-barrel, and I am not sure if it was not a flint-lock. Double-barrel guns were not common in those days.

Following the example of "Graeme," I will state that I now use a Colt double-barrel breechloader, 12-bore, 30 inch barrels. She cost $65 only, at the factory, but she is a very fine shooter. For a quail gun I could not ask for a better one, but she would be better for ducks if she had two inches more of barrel. However, I have been loading all my shells alike; that is, with 3 drams of powder and an ounce of shot. I think I will take the hint from "Graeme" and hereafter put 3¼ drams of powder in my duck shells. It may be that I will then have no cause of complaint against my gun in duck shooting.

I have read numbers of "remarkable shots" by various correspondents in your columns. Now let me tell you of one "remarkable shot" which I witnessed. The fellow who delivered that shot was a hawk and not a man. I was gunning near Lorraine, a station on the Texas & Pacific Railroad, in a region where people are very scarce and hawks very numerous and impudent. Two quails rose before me and flew in nearly opposite directions. The first fell dead about twenty yards away. About forty yards off the second received my fire. There was a cloud of feathers in the air, and he tumbled toward the ground also. But while he was falling a hawk shot at him like an arrow, seizing him while yet in the air, and bore him off in triumph. Now I call that a "remarkable shot"—not for distance or anything of that kind, but for downright, unadulterated impudence. It was snatching the food out of the very mouth of the lion. As that hawk flew saucily by me with my bird, I fancied that he said, "Now, old fellow, how do you like that?" and I verily believe he did say something of the sort. He was a small hawk, just above the sparrow hawk in size, and of a very rakish air. His sort are numerous on the Staked Plain, where they worry the blue quails terribly. Pray give me the name by which this dashing little villain is known on the scientific shore. I do not recollect seeing him in this part of Texas.

Now I want to ask FOREST AND STREAM or any of its readers to solve me a riddle which has caused me a great deal of thinking. It is this: Where do those prairie dogs which have their towns miles and miles from any visible waters get their water? Can they live and flourish for weeks without water, or do they, as some say, dig down to water in the earth?

I have seen thousands of these little animals many miles from water; indeed, their towns are usually a long distance from water, and yet they are just as lively and fat in such localities as where water is easily accessible. I should not judge from their looks that they are an animal that can live long without water, but the great majority of them must do so unless they bore down to subterranean fountains.

The great interest I feel in this question, apart from the scientific feature, is this: I have a mind to dig some wells in the vast prairies of Northwest Texas, where water is very scarce and prairie dogs very abundant. These lands are extremely fertile and lack only water to make them very valuable. Now if it be decided that prairie dogs cannot live without water, and that they must bore down to subterranean water when so situated that they cannot obtain it at the surface, it simplifies matters to me very much; for I am sure if these dogs can bore down to water, I can too.

N. A. T.

PALESTINE, Texas, Jan. 19, 1885.

MAINE LUMBERMEN AND GUIDES.

Editor Forest and Stream:

Now that the ice is broken perhaps a little more from my pen will not be amiss. In your issue of Jan. 8, Mr. Hardy has made out quite a story as to what his experience has been for a great many years past as a merchant in the city of Bangor, and in trips made to the hunting and fishing sections in the eastern part of our State, also his acquaintance with visiting sportsmen, guides and lumbermen.

It is not without a feeling of delicacy that I attempt to criticise some of the statements made by a man whose experience, perhaps, dates back to the time of my birth. If Thoreau is to be believed, a man does not have to live a life time to learn a few things, and as my home and business for the past fifteen years has been with the sportsmen and lumbermen directly on the ground I ought to understand both parties pretty well by this time.

I have handled the ax with the lumberman in the logging swamp, and the cant-dog and pick-pole on the drive, and although from the lack of experience and muscle I could not take the heart of the spruce from the "Kennebeck Linger" or ride out a "white water jam" with the "Penobscot Bubble Walker," like the old man's mare on the trotting course, I was generally "a coming somewhere." The lumberman's license when he is in the settlement is not limited, and the opinion that Mr. Wells expressed is a very general one formed by people who have seen more of them than he has, and if you do the average lumberman no greater injustice than to think him a "hard crowd" you will never make an enemy of him.

As a class, there are no better-hearted men in the world than the lumbermen, but one must camp with them more than one night to understand them. I have "spooned up" to the man, many a night on the drive, when forty of us would crowd into a thirty-man berth, who, although he would "paint the town red" when he got started, would coddle me, slide one of his strong arms under my head for a pillow while his other made a brace to keep the men from nearly squeezing the life out of me; he "would not see the boy crowded," and now that the boy has got his growth and can stand the crowding, he does not forget his lumbermen friends by any means.

Had Mr. Hardy summered with the visiting sportsmen for twelve successive seasons, as I have, I am sure he would see see them in a different light from what he appears now to see them. To be sure, we have some of the class he has spoken of; but where we have one of that class we have fifty of a far different class, more who are like Mr. Wells. Although Mr. Wells's critics say that he has selfish motives in writing these articles, I can affirm that he has not; it is only one of many acts of kindness, "with no personal interests in view," and when they are read in the same spirit in which they are written, they will be understood right. If the percentage is very largely in favor of the better class, are not the people who come in contact with them much more likely to be elevated than they are to be corrupted? In all my being with sportsmen, none of them ever attempted to pour any liquor down my throat. When the flask was passed, a few words to the effect of "Thank you, sir, but I never take it," were generally all that was needed; and much oftener I have had

men who might drink to excess themselves tell me to "Stick to that" than I have had them urge me or pass it a second time.

Mr. Hardy speaks as if the money distributed by the sportsman was of but little benefit to any one excepting the railroads, hotels and guides. Had his home in years past been in one of those border towns visited by sportsmen, and his occupation not a guide but one of the poorer class of farmers such as Mr. Wells describes (and in describing did not draw from his imagination), he would find that the money brought into the place by the sportsman was a great benefit to him. When the settlers produce such commodities as butter, eggs, lambs and chickens, he receives for them more ready cash at his own door than he would after he had transported them twenty or forty miles to the railroad. Is this not an advantage? Again, in case of sudden sickness or accident, instead of the twenty miles' drive to Phillips for the doctor, the telephone does the work; the message is sent and back comes an answer, the doctor will start in five minutes. As the man pays his fifteen cents and hurries back to the bedside of his wife or child, does he realize no benefit from the money distributed by the sportsman? And though an individual may receive no money directly from the sportsman, is the benefit the less, and cannot he afford to lose some of his pleasure and perhaps immediate gain in hunting and fishing for it?

As far as the great damage to the timber lands of our State by fire is concerned, this is true to the letter; and I do not wonder that the men that own wild land look with suspicion on every one who goes in the woods. In some cases sportsmen cause these fires, but I think these cases are few. It is generally supposed that the sportsman knows nothing about building a camp-fire, and is liable to burn the country up at any time; were it not that the sportsman is in most every case attended by a guide who is experienced and who does this kind of work, there might be cause for alarm. I have been over the hunting and fishing grounds of our State as well as other sections of it considerably, and should say that certainly in two-thirds of the cases the fires were started by people much nearer home than the sportsman. Take some of the tracts of country that were not visited by sportsmen until within a few years; look them over and see if you can find as many places where fires have been started and have done more or less damage since the guide began to build his "shanty" (which was as soon as the sportsman began to visit the region), as were started in the same number of years before; and when you find a burnt place do not say that the sportsman did it until you have asked some questions. When a man puts his money and labor into a camp in the woods—no matter how cheap or how expensive it may be—he does not build it to be burned up, neither does he want to see the country about it burned, which would be just as disastrous to him. Does not his own self interest, if nothing more, cause him to be just as careful with fire as he would be if the land were all his own, and would not he "fight fire" with just as good a will? The men who own the timber lands in this region are greatly respected by the guides and all who have had dealings with them, and this does them no harm in regard to the safety of their property. On a recent trip to the more northern and eastern part of our State, I was surprised to see how much more damage had been done by fire there than in this part.

In regard to the slaughter of fish and game by the French lumbermen, spoken of in my friend Danforth's letter to Mr. Wells, I cannot speak from experience, as I have not been in that vicinity in the winter since they commenced to lumber it, but John has been there a greater part of the time, and I well warrant that he knows what he is talking about. Mr. Hardy has not "the exact ground" located just right after all his trouble; it is more than thirty miles north of Mr. Coe's operation.

Your North Bridgton correspondent seems to be of the opinion that "the little gnat of a Frenchman" is not much on the hunt. I should like to see the gentleman try to step in that little fellow's tracks, when he has snowshoes on and is "crusting" a deer. Unless he is blessed with a very long pair of legs he would find that there was a chance for some strain there. He may know the Frenchman as he is at work in the mills and living in our villages and cities; but I know him as he is in his border Canadian settlement home, and I have also seen his track in the woods.

I wonder if Mr. Hardy realizes the difference in the sportsman, hotel keeper and guide of '58 and '85. My experience is that no two gentlemen can be found to-day that would waste three hundred pounds of trout at any public fishing place in Maine. If they did they would most likely be spoken to by both hotel keeper and guide. The practice of "socking out" has given way to the wiser course of unhooking and letting go all fish that are not needed. This is every day gaining strength, and it is the duty of every hotel keeper and guide to "talk it up." As fly-fishing and light rods have come into fashion, it is found that a few fish caught on the "light rig" afford much more pleasure and the needed exercise than many fish caught on the "derrick." The two-pounder caught on the fly with the light rod affords more pleasure than the eight-pounder caught on the hand-line or stiff bait-rod. Viewing matters in this light, would it not be more practicable to drop bait-fishing from July 1, instead of stopping all fishing Sept. 1 or 15, as has been proposed. In doing this the large trout (the best breeders) that congregate in the deep holes of the lake and succumb to the patience of the deep-water fisherman, would be spared to breed or be caught in a way that would mean something besides just the getting. Besides this, the bushels of chubs, suckers and redsides (the food of the trout) that are caught and chopped up to bait these places would also be spared Ripe spawn can sometimes be found in trout at all seasons of the year.

Although I am writing in a 12x14 room, where a game of high-low is going on, and my head is full of "What's trump?" "Here, you, let that be," and "Put your Pede right on there," I cannot hold up without thanking Mr. Hardy, in behalf of myself and my guide friends, for his compliment as to his ideal Maine guide. CAPT. F. C. BARKER.

BEMIS CAMPS, Rangeley, Me.

Editor Forest and Stream:

I have been greatly interested in the various articles regarding the "Maine Deer Law," and the opinions of the majority of your correspondents are good, and should be allowed to go unchallenged, but when one writer asserts that the French Canadian is, so far as fish and game are concerned, a quiet and inoffensive person, it is time that we who are thoroughly acquainted with the habitant should cry "halt." My own experience with the country "Canuck" relative to the protection of fish and game, has been a long and eventful one, and instead of finding them veritable saints, I have found them, as a rule, a class of inveterate pot-hunters of the lowest kind. They will kill for the pot everything, from a small bird to a mother partridge with her brood, or a doe heavy with young in March. During the season of deep snows and crusting they swarm through the Megantic woods in this Province, running down and slaughtering the few deer that remain in that country, and they also carry their depredations over the border into Northeastern Vermont, around Big and Little Averill and Leach lakes; also into the extreme northern part of New Hampshire, etc. They fish through the ice, and when the ice goes out their set-lines and gill-nets may be found in every stream and lake in the Province, as well as their snares for partridge and hare are to be found in every bush near where they reside. The greater portion of small game that is brought into this market (Montreal and Quebec) is killed by the French habitants. During the summer months the innocent "Canuck" may be met at all hours of the day or night on our waters prowling about in his dugout with gun, jack and spear, and he seldom returns home empty-handed. This utter disregard of fish and game protection is not confined wholly to the lower class of French habitants, as a perusal of the game laws of this Province will prove.

We have here in Montreal a large and earnest working game protection society, but they can do but little toward remedying the defects in the game laws beyond putting the present laws in force, as the French are largely in the majority in the local House of Parliament. The Missisquoi River, in the vicinity of Highgate, Vt., has been lately stocked with black bass, and last summer the noble *Parlezvous* neglected his work, and spent his time in scooping out the fry by the thousands. The Legislature of that State, however, has put a stop to that work by passing a law forbidding any bass to be taken less than ten inches in length. The worst poachers on the Missisquoi marshes last season were French Canadians fresh from the factories. If I had the time and space, I might give numerous incidents that have come under my personal observation to prove the truth of my statement that the French habitant makes the most inveterate of pot-hunters.

I notice in your last issue an item that a deer had been seen on Sutton Mountain, near Richford, Vt. Sutton Mountain is over the line in the Province of Quebec. Some seven years ago, in the interest of "fish and game protection," I visited a back settlement of English settlers on that mountain, and learned from a local trapper, Mr. Chester Aiken, that there was at that time, the month of March, a yard of about a dozen deer on the mountain, and the English residents in that vicinity have interested themselves to protect these deer, so it is quite probable that their numbers have increased rather than diminished. STANSTEAD.

MONTREAL, Canada.

Editor Forest and Stream:

Sportsmen will learn with a feeling of gratitude that but very little venison is coming into the Boston market, as compared with former seasons. When the close time for Maine venison came on (Jan. 1), the dealers in that State who happened to be still disposing of each his lawful quota of "three deer, two caribou and one moose," quickly put the meat out of sight. The custom of obeying the game laws in that State becomes easier as it becomes more of a custom. The Game Commissioners and sportsmen of Maine are much pleased with this evidence of actual progress in public opinion. It is not of their own marketmen or hunters that the earnest friends of game protection in Maine have to complain, but of other markets which would be glad to offer Maine game at all seasons, and of sportsmen who desire unbridled license to destroy when it best suits their own convenience.

When the Maine venison season closed, but little was shipped to Boston this year, for the trained force of wardens were on the alert. At this the Boston game dealer is somewhat disappointed. He gets a little venison, it is true, but it is chiefly western. Not more than one deer out of fifty in 1882-3 is seen here this season. The chances for crust-hunted venison are also very small. The snow in the Maine woods is not yet deep enough to hinder a deer from making full speed. An early thin crust over not six inches of snow prevented the late December hunting—the deer could run, but the hunters could not approach, the breaking crust making noise enough to stampede every deer or caribou within two miles. One or two hunting parties gave up in despair. Taken all in all, it has been a wonderful season thus far for the preservation of deer.

The chances are very small that the Maine Legislature will make September an open month. The Maine papers do not generally favor the measure. The reply of "North Bridgton" to Mr. Wells, in FOREST AND STREAM, has been extensively republished in Maine, and it will also be used in reply to that gentleman's argument before the committee of the Legislature. The prevailing sentiment of the Legislature of that State is one of gratitude to the Commissioners for the good work they have done, and the expression is likely to be very general in favor of giving them their own way for a while longer. Some of the strong expressions of adverse opinion, which have been published, are received by the earnest laborers for game protection in Maine as promulgated in rather bad taste, since the authorities have in their possession the testimony of guides going to show that one or two at least of the earnest advocates for open September are guilty of "jack-shooting" and "calling" in Maine in that month. SPECIAL.

A SCORE OF HITS AND MISSES.

Editor Forest and Stream:

I have just finished reading "Wells's" account of his "partridge" hunt in Chatham, and was particularly interested in, and I must say, pleased with his summing up of "shells used" and "birds bagged." I "felt good all over" to see that some of the older crack shots are satisfied with killing one-half their shots. So many men claim to do so much better, yet when I hunt with them, do so much worse. Now I know and all who have shot birds season after season know that to figure up at the end of the season and find that when we have bagged one-half as many birds on the wing as the number of shells used, snapshots and all others being counted, we have done much better than usually falls to our lot.

Very few young sportsmen think to keep a record of shots when they hunt, sometimes as often as three days in the week. However, having been out shooting less than usual this winter and fall, I have kept an account of my outings, and find I am "ahead of the record," though I am confident that had I kept a similar record during the two preceding seasons I should have been behind; I had not learned the peculiarities of my gun until this season—the exact load required, its limit of range, etc., etc. I find that by keeping one gun for constant use, and confining myself entirely to its use, I can make much heavier scores than when constantly changing guns.

I began shooting the present season quite late, after the birds were full grown and strong, and my outings resulted as follows, the time of each outing not exceeding a half day, generally an afternoon:

First (afternoon),	used	10	shells; bagged	7	birds
Second (afternoon),	"	19	" "	14	"
Third (afternoon),	"	18	" "	18	"
Fourth (morning),	"	22	" "	12	"
Fifth (afternoon),	"	7	" "	4	"
Sixth (morning),	"	10	" "	8	"
Seventh (afternoon),	"	8	" "	7	"
Total		94	shells	70	birds

Thus scoring a very good average, though this may be accounted for by my getting such few shots, as I was breaking my young dog and birds were unusually scarce. You will notice that one afternoon's work was 18 shots and 18 birds. Two shots were missed and I made two doubles. I frequently kill as many as 200 birds of a season, but have hunted very little this season, as the birds seem scarce and we wish them to increase as much as possible during the coming season. A very peculiar feature of the last outing was the fact that I saw no male birds at all, and all of the seven bagged were hens. Why is this, think you? I have not noticed the same thing any previous year.

Having been badly injured while fox hunting on Christmas Day, my horse falling and throwing me and striking my head with its front shoe, I have not been able to get around much; but am getting on my feet again and will give the birds another "go" soon, when, if I find nothing but hen birds, I shall lay my gun away until another season, or else go to Currituck Sound goose shooting. BELVIDERE, N. C.

SOME REMARKABLE SHOTS.

Editor Forest and Stream:

Like one of the recent contributors to this department, I have made some remarkable shots, which didn't bring anything to bag; but of them I will write at another time.

Once I was calling three old gobblers, and found them coming straight toward me along a trail. Watching my opportunity, I succeeded in catching them in a row, one behind the other. I fired a rifle ball through all three, killing them instantly. Three fine gobblers, weighing upward of twenty pounds each, at one shot, I thought was pretty good, especially as there were only three turkeys.

Just after the war, I was out hunting deer with a friend. I soon killed a small one. We concluded to take it immediately to where our horses were hitched, a quarter of a mile away. Soon after starting, I saw a doe lying on a hillside in easy shooting distance. I gave the shot to my friend. When he fired, the deer flattened out on the ground, and I heard the bullet whizzing on. He shot an army Enfield rifle loaded with army cartridges. On going up to the dead deer, we heard a rattling in the bushes a little further on, and on looking found two well-grown fawns almost dead, both shot through the necks; all three killed by one bullet, and after all that execution it whizzed still further.

I was trying to stalk an old buck antelope once, but failed at every attempt. Finally growing discouraged I sat down and concluded to try one shot at long range. I was using a .40-90 Sharps rifle. Guessing the distance at 1,000 yards, I made the proper elevation, and after careful aim, fired. The bullet passed through his heart, killing him in a few seconds. I call this a remarkable shot, though it was exactly what I tried to do.

I once bagged sixteen mallards at one shot, using a 12-bore shotgun. They were feeding on acorns. My second barrel failed to fire. BLACK TAIL.

EL PASO, Texas.

Editor Forest and Stream:

Last autumn I was walking along the shores of a small lake, carrying a .38-caliber rifle. Close to shore on the other side, so distant as to be scarcely visible to the naked eye, was a lone duck swimming around. Intending to induce it to take wing, so that a companion with his shotgun might possibly get a wing-shot, I raised the sights to 400 yards, took aim and fired. There was a splash, a flutter, and the duck lay dead upon the water.

Another: During the winter a sudden severe cold snap froze all the streams and ponds in this section. A friend knowing of a large open spring, some six or eight miles distant, came around with his buggy, and we drove to the spring. Sure enough the water was open, and the surface so covered with big mallards that the water could not be seen. The spring or open pond was about thirty yards long and about ten wide. On the west side close to the water there was a high bank, making approach to within twenty yards very easy. We cautiously crawled up to the edge of the bank and poured four barrels of No. 4 shot from our breechloaders right down into that unconscious mass of mallards, crowded into that small water hole, and killed—one old drake; and he was probably scared to death.

TENDERFOOT.

CLAY CENTRE, Kan.

Editor Forest and Stream:

Your remarkable shot series or incidents are interesting, though many, if not all, are accidental or simply chance shots. Let me relate two chance shots. During the year 1853 I was camping on Floodwood Pond in the Adirondacks, when deer were almost as thick as sheep in a farmer's pasture, and you would think so when I tell you that one day I counted fourteen in sight, in two hours from my camp. One morning my guide and myself took a tramp through the woods, and seeing a large buck, on the shore of a small pond, he fired and we went around the pond to secure our trophy, and imagine our surprise to find two dead deer—the two were standing side by side. The next season I camped on the same ground. One day a companion borrowed my Lewis rifle. He with his guide shoved away from the shore about two rods, and across a bay, certainly eighty rods, saw a buck feeding. He took deadly aim and fired more for the "fun of the thing, to see the deer run," than with the least idea of capturing the prize. The ball struck the water twice, glanced and killed the deer feeding on the lily pads. M. D. R.

Editor Forest and Stream:

While hunting in Spencer's Grove, Iowa, a few years ago, a gray squirrel ran up a tree and disappeared behind a bunch of leaves. Taking aim at where it was supposed to be, I fired, and two fine squirrels fell dead at the root of the tree. Some sixty-five years ago, my grandfather made a home for

himself and family in the hill country of northeastern Pennsylvania. Game of all kinds was abundant. Needing meat one day, he took his rifle, mounted his horse and rode into the woods. Seeing a flock of wild turkeys on the ground, without dismounting, he raised his gun to shoot a large gobbler that stood with its neck outstretched in the path before him. Just as he shot, another one in all respects like it, took position by its side, and his ball cut both their throats close to their heads. He tied their heads together, threw them across the horse in front of the saddle, and rode home.

K.

Vinton, Iowa.

Editor Forest and Stream:

Your remarkable shots have reminded me of one I made several years ago. I have thought it a case of pellets being deflected by quail feathers.

A quail flushed to my right about 30 yards, and as I threw up my gun I saw a negro boy, Jim, who usually accompanies us to "tote the game," in a direct line about 50 yards beyond the bird. He called, "Look out, Mr. L." I answered, "I see you; all right," and I held fire until the bird had flown rather to the front of me, and at an angle of about 45° from the line between the boy and myself, when I fired. The bird fell dead and Jim called out, "I am shot." I laid down my gun and ramrod (which I had drawn immediately on firing, as was my custom in muzzleloader days) and went to Jim, and found him well peppered with about a dozen No. 9s. It seeming strange that he had been hit, I then carefully noted the positions from whence I had fired, of Jim and the bird. Jim would say afterward that the doctor said it was not healthy for him to go with me.

Wilmington, N. C.

BATTERY-SHOOTING.

Editor Forest and Stream:

It is with considerable satisfaction that I notice in some of your back numbers, that battery-shooting, as practiced in some portions of our country, has been made a subject for discussion; for I believe that wherever this method of destroying wildfowl shall become generally understood, and it is shown to be the destructive evil it really is, there will then be little difficulty in having laws passed to suppress forever these destructive engines in every State within whose borders they can now be used.

The foregoing paragraph will leave no doubt upon the mind of any reader which side of the argument the writer takes, and with your permission he proposes to give some reasons for the "faith that is in him." Before replying to any of the statements contained in the articles published in Forest and Stream on this subject, I think perhaps it best to show wherein battery-shooting is a destructive evil in so far as wildfowl are concerned. In the first place, the fact that by this method the gunner is, in the vast majority of instances, enabled to kill more ducks than in any other way, for a time at least, is so entirely conceded by every one with any knowledge of the subject that it is not necessary to do more than make the statement. This in itself might appear more of a benefit than an evil to the gunner; but at times it is fraught with misfortune even to him, as I will show. As soon as the law permits, generally before winter fairly sets in, the batteries are at work. The birds, having just arrived from their feeding grounds accompanied by their young, are gentle and unsuspecting. Vast numbers are killed and shipped to market, but they do not all get there. The weather is warm, decomposition proceeds rapidly, and many are thrown away. A few seasons ago, from Currituck Sound alone, in the month of November, between 5,000 and 10,000 birds were thrown away in the canal and in the harbor of Norfolk, having spoiled on account of the weather. These were all shot from batteries and bush-blinds. Our seasons for shooting wildfowl open much too early throughout the land. Because more birds can be killed by this method is the reason that batteries multiply so rapidly where they can be used.

Now, why is it that more ducks can be killed by this method than by any other? Simply because they are placed in the midst of the feeding grounds, away from the shore in shallow water, and the birds are compelled to resort there to get their food, otherwise they must starve or seek some other locality. That they prefer to do the latter after having been shot at from these sunken blinds for a brief period is a thoroughly established fact, and may not be wondered at. Because booby-blinds are erected on the feeding grounds, as stated by one writer, is no argument or excuse for batteries being there. Both should be prohibited by law from being placed in such positions. Harassed continually upon their feeding grounds by being repeatedly shot at, the birds depart to other places where they can feed unmolested. I am not speaking of any especial tract, but generally, for my experience of, and with, batteries and like machines extends from Currituck Sound to the Mississippi River.

But the battery itself is not the sole evil. It has a partner even more objectionable if possible than itself, and without which it would be comparatively harmless. This assisting terror is the tender, composed of a man and a sailboat, whose duty it is to gather the slain birds, and, of equal importance, to keep in motion any flocks that may be within reaching distance. If a number of birds have settled upon the water, either to dress their feathers or to snatch a few moments of needed rest, no sooner does the tender spy them than he bears away and compels them to take wing, in hopes that some may be decoyed to the battery. These sailboats are kept in constant motion, quartering the sound or river as setters do a field, and where several batteries are stationed no duck can settle near-by for a moment, and with this species of persecution, together with the roar of guns discharged from apparently beneath the waters, than which nothing more terrifies the fowl, is it any wonder that in a short period the birds desert a locality where the laws permit them to be so unceasingly disturbed?

Beside the fact that more birds are killed for a time by this method, there is nothing to recommend it. The gunner lying at full length on the bottom of his box is exposed to the rain, the freezing cold and the snow. Icy spray breaks over the sides, the box contains more or less water; sometimes he is forced to bail to keep himself afloat, and retributive justice takes a hand in his pursuit, and not infrequently he receives with his bag of birds the seeds of rheumatism, pneumonia or consumption. I have been told by the battery men in Currituck Sound, where, from its comparatively mild climate there should be less risk in this mode of gunning, that a man cannot stand it much over three or four years. It is essentially the method to be used for those who shoot for count, unworthy of the true sportsman, acceptable only for the pot-hunter.

In your issue of Jan. 29, a writer comes to the defense of battery-shooting over the signature of "Sinkboat," and gives his opinion on this method of killing wildfowl. His views are evidently so honestly entertained as to the advisability of batteries being used, and so frankly given, that they merit respectful treatment, though founded in error, and incapable of being sustained by any proof. He commences by stating that he knows nothing as to how battery-shooting affects wildfowl apart from the waters of the Chesapeake, but even there he confesses that it would be well "to confine the number of boxes licensed to a much smaller number, and allow no others on the ground." Why would he do this? Is it because he is one of the "kid-glove gentry," and a supporter of monopolies? By now manner of means, for, as I gather from his article, he is no friend to that class, but it is because there are too many batteries in his locality, there is "too much shooting," and presumably the ducks are annually decreasing in numbers. His proposed remedy is a virtual confession of the destructiveness of batteries.

Because, perchance, there may still be a large number of birds frequenting localities where battery-shooting is permitted, some persons not fully conversant with the matter, may deny that this method drives birds away. I will state some facts to show how incorrect would be such denial. In Sandusky Bay, Ohio, where are now situated the grounds of the Winous Club, batteries were formerly used by everybody. The fowl were in myriads and the supply seemed inexhaustible. But gradually a diminution of their numbers was perceptible, year by year the birds and the scores decreased, until 1,200 birds was the total score of all engaged in shooting for an entire season. Then a State law was passed, prohibiting the use of batteries, and the grounds were preserved. Soon the birds began to return to their accustomed haunts, and from 1,200 killed, the score increased until it reached the grand total of 9,000 birds bagged in a single season, and no diminution in the number of the fowl was perceived. They were unmolested in the open water and on their feeding grounds.

"Sinkboat" mentions Currituck Sound. I can speak of that section from an acquaintance with it of twenty years. Before batteries or bush-blinds were known there, the birds gathered in countless myriads during the period the more northern waters were frozen. It was their natural winter home, not a place to be occupied temporarily during their migration, and they remained until spring. How is it today? Ducks, geese and swan still resort there, but in diminished numbers; but their lives are lives of terror and unrest, and many depart for the south after a short stay. Batteries, bush-blinds and sailboats give them no peace, and their only places of refuge are the grounds of the various clubs, where they are out of reach of these open-water destructive engines. As to the profits obtained by the market gunners, I learn, from repeated inquiries among them, that it is rare for any owner of a battery or a bush-blind to make living wages during the season, although numbers of birds are killed, and most of them are in debt when spring comes. The only salvation for the wildfowl in Currituck at present is the law prohibiting non-residents from shooting afloat. It is to be hoped that a law may soon be passed that shall forbid any one from shooting on the water. Thus far the non-resident law has prevented the fowl from being driven entirely out of the State, which would surely be the case if the waters were open to all.

It is for these and kindred reasons that so many States, on the petitions of sportsmen and others desirous of preserving our wildfowl, have prohibited the use of batteries within their borders. I think any one conversant with battery-shooting will perceive, in spite of "Sinkboat's" vehement denial, that this method is more "detrimental to shooting than the same amount of shooting from the shore." Facts prove it, the diminution in the number of birds shows it. The box cannot be separated from its accompanying boat, and such birds as the occupant of the former fails to kill, the latter drives completely away. So well is this understood that on the Gunpowder River, where for years I have been accustomed to shoot, we always look for an extra flight of birds on the days the batteries are at work on the Susquehanna Flats. The birds leave their feeding grounds when the fusillade begins, and soon after sunrise appear on the Bush and Gunpowder. It has been remarked of late years that the birds were more plenty on these rivers, and this can hardly be said of the Flats, and the increased numbers on the rivers has been attributed to the absence of batteries. It is hardly necessary to follow "Sinkboat's" argument that those who shoot from the shore object to boxes on purely selfish grounds. If he is a sportsman he has at heart that desire, which above all else influences a sportsman's actions—the desire to protect our game in all localities it frequents; and if he has been shooting thirty-five years he knows well enough that wherever batteries are systematically used, a diminution, if not the entire disappearance, of wildfowl is sure to take place.

An exception may properly be taken to his statement that the box is a more humane mode of shooting, for the reason that for "every duck bagged off a point it is safe to say that two or more are crippled," while "nearly every duck struck out of a box is killed." I believe, and I think my experience tends to prove it, that just the contrary is the fact, for as a rule, speaking of no especial locality, it is the flocks or bunches that go to the batteries, while single birds or bunches of three or four go to the points. The great bags made by the batterymen are not derived from single or selected birds, but from shooting at the flocks when they "double" over the decoys. "Sinkboat's" suggestion of increasing wildfowl by only permitting them to be shot from boxes is, of course, intended as a joke, for it is not at all in harmony with his first idea of limiting the number of batteries to be used. He is also very much in error when he says: "None can commit a trespass in the water." Has he never heard of riparian rights? The gist of his article seems to be summed up in the remarks, that "box-shooters will die hard, but if box-shooting must stop, then let all ducking points be open to all sportsmen." Evil things always do die hard, but for all that let us endeavor to hasten the time of their dissolution. The doctrine that private property should cease to be such and be thrown open to those who indulge in objectionable practices, in order that such practices may be abated, smacks so strongly of communism, that it can only be acceptable to those who have nothing to lose.

Sagamore.

Deer in Vermont.—The deer killing in Richford, Vt. during the fore part of January, was done contrary to law. After it was killed it was brought to Richford and peddled about the streets in open defiance of the law, and the authorities have done nothing about it, and it is said they do not intend to.—Snip Snap.

DEER IN THE ADIRONDACKS.

Editor Forest and Stream:

There was published in the Forest and Stream of Oct. 2, an article, bearing the signature of "L.," on the protection of the game in the Adirondacks. Some of the statements made have been severely condemned, especially that in relation to the hunting of deer out of season by some of the guides of that region during the early summer months. Among their number was Commissioner Sherman, who accuses "L." of being a wilful falsifier or having been made the dupe of others. Although I do not agree with all contained in "L.'s" article, the statement he makes in relation to the guides hunting deer during the close season is to my certain knowledge perfectly true of a large number of them who follow their vocation in that region.

Not only have I resided nearly all my life near the borders of the Adirondack region and have frequented some portion of it nearly every season for twenty-five or thirty years past, but I have for the last six years spent the greater portion of each summer in camp in the heart of what is known as the St. Regis district, a locality much resorted to by sportsmen and hunters for the purpose of hunting deer. During the greater part of this time my camp has been located on the upper part of the sixteen-mile level, a portion of the middle branch or main branch of the St. Regis River, which is still water and navigable for small boats or skiffs for that distance. This river and the level is the principal thoroughfare by which the numerous streams and ponds in the southern and western part of the district is reached.

These ponds and streams are frequented every season, during the early summer months, by numerous parties of sportsmen and hunters, who come in by way of the hotel at Blue Mountain, near the foot of the level, and by way of Paul Smith's, on St. Regis Lake, from which this branch of the St. Regis River flows. At these hotels these parties are fitted out with guides, boats, tents, etc., for camping, and they go to the banks of some of the ponds or streams, where they go into camp and will often remain there two weeks at a time; and every night that is favorable will, with the help of their guides, hunt and slaughter deer by jack-light. This has been going on every season during the months of June and July, and the last has been no exception to the rest. I am personally acquainted with the majority of the guides who frequent this district, as well as with many others who follow their vocation elsewhere. Among all of them there is but a very small number who will not and have not hunted deer, more or less, out of season during the last two years. And more than that, some of the guides who reside in or on the borders of the district have, when not engaged as guides for others, hunted and killed deer for themselves in the months of June and July, and sometimes even in May; and have jerked or smoke-dried the venison and sold it at the stores in the settlements in St. Lawrence county, on the western borders of the district. The guides who frequent this district are not mushroom oarsmen, but are all experienced hunters, and many of them have been guides for years and some are well advanced in years.

I do not consider it a sure proof of a guide's honesty that he can be safely trusted with the care of valuable property; for the reason that there is not a guide but what is well aware that should he abuse this trust in the least his vocation as a guide would end. I can point to two guides who have been confined inside of prison walls, who are skillful hunters and excellent guides, whose services are in great demand every season, and not a season passes that they are not trusted with the care of valuable property; and I know others that could not get trusted for a plug of tobacco at any store where they are known, but who are frequently trusted with property of large amount. That there are many guides throughout the Adirondack region who are honorable and law-abiding I have no doubt. I know of a few that are such myself, and I also know of others that are not. But I know of a far greater number than both combined who are perfectly honorable and also law-abiding in all respects, except in observing the game laws. To these they pay no respect except that they fear their enforcement.

It is the same in regard to the game laws as it is with the custom laws. There is hardly any one who thinks there is any harm or wrong in smuggling goods out of Canada, providing that they don't get caught at it. And the guides as well as many others in Franklin county think the same in regard to the game laws. If they are not caught in the act of violating them they think it is all right. Mr. A. R. Fuller, of Meacham Lake, in commenting on the statement made by "L.," makes the statement that guides cannot be procured at his guide house for the purpose of hunting for others out of season. I would like to ask Mr. Fuller if he does not think it is himself that deserves the credit for this rather than the guides in his employ; and if he does not believe that should they for any reason leave his employ they could not then be induced to hunt for parties when it is unlawful to do so, especially should the parties promise, as many do, to pay all fines should they be prosecuted for violating the game laws?

Some of the guides who frequent the St. Regis district defy the law in words as well as in deeds. One of the leading guides while at my camp one day in August last, stated in my hearing that he had always hounded in June and July and always should; and he would put a ball from his rifle through the one that informed against him. Several others heard the remark. This man is a favorite guide with a large number of sportsmen, from whom he has received many valuable presents. Although no one cares for the threats that such persons make, or at least fear that they will be put into execution, it shows their disposition, and I have no doubt such persons would not hesitate in seeking revenge to destroy property about one's camp should they have the opportunity when the owner was absent. Such cowardly acts have been committed a number of times since I have frequented this district.

I do not, by any means, wish to be understood as blaming the present game protectors, for I happen to know that some of them, among whom is the protector to which Franklin county is assigned, are doing all they can to enforce the game laws in their respective districts. As yet, Mr. Leonard, the protector of this district, which includes the three counties of Franklin, St. Lawrence and Jefferson, has been unable to accomplish much within Franklin county, for the reason that he has during the past had all that he could attend to in the other two counties. But he informs me that he has now arranged matters in those counties so that by early spring he will be able to give the most of his attention to this county. In St. Lawrence and Jefferson he fortunately has the sympathy of a large portion of the inhabitants, and has in many localities secured the services of persons that he can trust to watch in their respective localities for viola

tors of the law, and will notify him at once if his presence is required there.

The territory assigned to this district is altogether too large for one protector. No one protector alone can successfully enforce the game laws in all parts of it, especially in those parts where the residents are not in sympathy with game protection, as is the case in a great portion of Franklin county. Only a short time ago I was told by one of the leading men of the county, who has been elected supervisor several times, that he thought game protection by the State wrong, that it was wrong to tax the people to pay the game protector's salary, when not one in a thousand ever went into the woods to hunt or fish, and he did not care whether game was protected or not. Scores of others in the county hold a like opinion of game protection. This a game protector has to contend against. There are localities in the district to reach which, by the route the protector would be obliged to take, would require a journey of a hundred miles or more, and to go there and return would use up over two weeks' time, and the expenses for the trip would be $50.

As far as intercourse between the two places is concerned, the settlements in the southern part of Franklin county, on Tupper's Lake and elsewhere, and the villages and towns on the northern border of the county, are as distant apart as those villages and towns and the Territory of Dakota, as it requires the same length of time to go from them to the one place that it does to go to the other. This district contains within its borders one-half at least of that portion of the wilderness that is the most unsettled and inaccessible. Many parts of it can only be reached by traveling through the woods on foot, or by boats a part of the way, when one can be procured. For one person alone to properly enforce the laws in a district like this would require a salary to pay the traveling expenses alone larger than all the salary a game protector gets. Were it not for a share that a game protector gets of the fines collected, the protector for this district would not have been able to do what he already has done in St. Lawrence and Jefferson counties toward their enforcement there during the past two years.

I have, as probably will be noticed, omitted to mention any cases of violation of the game laws at other times than during the early summer months, or of their being violated by any other method of hunting than hunting at night by jack-light. My reason for so doing was, because the statement made by "L." principally, if not wholly, referred to violations of the law by the guides in those months. I only wished to state what I know to be facts from my own observation, and which cannot be successfully contradicted. But that the game laws are violated in the St. Regis district at other times during the close season and by different modes of hunting, I am as well satisfied as I would be had such violations come under my own observation. I am informed by reliable parties that deer were hounded or hunted with dogs all through November, and in part of the month of December last, on and in the vicinity of the east branch of the St. Regis. Among those who were engaged in it were two of their number at least who act as guides during the sporting season.

A year ago in the last week of July, a party of so-called sportsmen came in by way of St. Regis Lake or Paul Smith's, with guides and dogs. They went to Long Pond, three miles west of my camp on the level, and remained there several days hounding deer. I heard the dogs myself from my camp. Shortly after they left two of my acquaintances went over to the Pond to fish for trout in the outlet, and they saw the carcasses of three deer in the water, from which only the hide and hindquarters or saddles had been taken, and the rest left to rot. I did not see the party nor their guides myself, but the latter were said to be by those who did see them guides who make their headquarters at Smith's Hotel. Deer are hunted with dogs frequently at times when it is unlawful.

Although there is the best of trout fishing in the streams and in many of the ponds, this region is but seldom visited for the purpose of angling alone, except by residents on its border, who occasionally go there for a day's fishing. Although netting trout is practiced in these waters, the laws in regard to fish or fishing are not violated to anywhere near the extent that they are by hunting deer.

I have written to show that the statement made by "L.," concerning the guides, are perfectly true of many of those who follow that vocation within the Adirondacks; and in part to show a few of the many obstacles against which the game protector has to contend, or which are in his way in enforcing the game laws, especially in this district, of which Franklin county forms a part.

I intend no disrespect to the guides in making these statements. They are no worse, nor as bad as the gentlemen sportsmen, so-called, who employ them to violate the law and who guarantee to pay all fines. It is not strange that many of the guides still violate the law. The majority are men of small means, who get their living for themselves and their families by guiding during the summer and fall and by working at what they can find to do winters. And when we consider that four-fifths of the inhabitants of the county have no sympathy with game laws or game protection, it is no wonder that guides violate the law, and almost impossible for the protector to enforce them. ADRION ONDACK.

NEAR THE ADIRONDACKS.

The general expression of public opinion, as given in the press of the State, is decidedly in favor of a non-hounding law. We give herewith a number of extracts from our exchanges:

THE PRESS ON THE PETITION.

We heartily commend the movement as both proper and desirable. If some measure of the character indicated be not speedily adopted, this noble game will no longer lend romance to the Adirondack region, and its existence, in a few years, will be known only in the hunter's story.—*Oneonta Press.*

We doubt not but such a petition will receive many signatures. The practice of hounding deer or slaughtering them for the mere sport of it should certainly be prohibited by law.—*Lowville Times.*

This is, really, a very important matter, and we hope it will receive widely extended attention and encouragement.—*Albany Press and Knickerbocker.*

Legislators should give their assistance to the framing of such a law, which seems to be the general will of the people.—*Buffalo Mercantile Review.*

This matter is worthy the attention of sportsmen. At the same time would it not be well to take measures to stop the shooting of deer hereabouts out of season, as was done in this city last Sunday?—*Rome Daily Sentinel, Jan. 28.*

This should be religiously attended to, for our deer grounds of the north are an inheritance which it is the height of folly to allow to go unprotected adequately. Every sportsman will take the matter to heart at once, and be anxious to see something definite accomplished. Who will take the matter in hand in Le Roy?—*Le Roy Gazette.*

It is to be hoped that the petition may be granted. The relentless warfare that is being waged against the deer at will, will soon exterminate them entirely. The natural ingress of civilization will too soon enough cause them to disappear, and all wanton and wholesale killing should be stopped.—*Bath Plaindealer.*

We hope this matter will not be allowed to rest until protection full and complete is given, by strict legislation, to this most wantonly per secuted animal.—*Avoca Advance.*

Those who value the Adirondacks as a summer resort, and all good citizens, whether they ever visit that region or not, will heartily indorse, and gladly attach their signatures.—*Pine Plains Register.*

The movement should be successful. Old hunters who have lived in the woods all their lives are in favor of restricting deer hunting to still-hunting. Drive the dogs out of the Adirondacks and keep the wolves killed off and deer hunting would soon become a real pleasure.—*Oswego Falls Observer.*

All true sportsmen will favor this, as at the present rate of killing their race must become extinct. Give the deer a chance. Should the law forbid their being hunted for the next five years it would more nearly meet the requirements of the case.—*Oneida Free Press.*

Unless something is done to stop the wholesale slaughter of deer in this State, the race will become extinct, and he who loves venison will have to enjoy it only in memory.—*Kinderhook Rough Notes.*

While on the question of protecting deer it would be well to re-enact the prohibitory law in Suffolk county. An old hunter suggests that a law might be framed to allow four days' hunting in the month of November, each year, giving one day in each week. Any legislation which will protect these fast disappearing beauties should be welcomed.—*Babylon Budget.*

It is a fact well known and regretted that the deer of the Adirondacks are rapidly disappearing, owing to the recklessness of frequenters of the wilderness. The favorite means of destruction is the use of dogs trained to the purpose. To put a quietus on that sport within the limits of this county, our Board of Supervisors at the sessions in December made it a criminal offense to use dogs for this purpose, and authorized the shooting of the dogs on sight when pursuing deer.—*Sandy Hill (Washington county) Herald.*

It is very much to be hoped that this effort will prove successful. Unless something is done, and that very soon to stop this and other modes for the wholesale slaughter of deer, the animal will at no remote date become extinct in the State.—*Camden Advance-Journal.*

Those interested in the preservation of game will be pleased to learn that a special effort will be made during the winter to secure a law preveuting the hunting of deer by dogs in this State. This unsportsmanlike and destructive method of hunting deer has been followed to such an extent that the deer are being rapidly exterminated. The FOREST AND STREAM has the present movement in charge, and it will be well managed and we hope successfully urged. We hope that some of our sporting citizens will be inclined to render assistance in this cause by circulating a petition asking for such a law.—*Cohoes News.*

There is a very commendable movement on foot to secure an enactment by the Legislature prohibiting deer hounding in the Adirondacks. The matter of better protecting the game of that and every section of the State has come to be one of vital importance.—*Moravia Valley Register.*

Deer hounding has so many objectionable features that its prevention by law would be not only humane but for the public good.—*Ogdensburgh Signal.*

Cut this out, paste it on to a sheet of paper, secure all the signatures possible, and send it back to the FOREST AND STREAM:

To the Honorable, the Legislature of the State of New York:

We, the undersigned, residents of the county of N. Y., respectfully petition that Chapter 543 of Laws of 1879, entitled "An act for the preservation of moose, wild deer, birds, fish and other game," be so amended as to absolutely prohibit the chasing, running and hunting of moose and wild deer with dogs, at any season of the year, on the ground that such chasing, running and hunting with dogs is very destructive to such game and is rapidly destroying the same.

THE DEALERS AND THE GAME.

THE newly formed Game Dealers' Association wrote to Chas. E. Whitehead, Esq., counsel for the Association for the Protection of Game, asking him on behalf of his society to request the New York Legislature to suspend the game law temporarily until the glut of game could be disposed of. Mr. Whitehead wrote in reply as follows:

"In reply to yours of yesterday, I would say that our Association for the Protection of Game has given the game dealers no assurance of immunity from prosecution for violation of the laws on this subject.

"The law of this State in comity with other States for the protection of its and their game and fish provided a large open time, within which game could be killed, extending it to Jan. 1 of each year, also a further time within which game so killed or brought here from abroad could be consumed up to Feb. 1, and after that made the dealing in game unlawful. The reason of the law is the preservation of species of game. The chief destruction of game arises not from the individual killing and using of game, but from the organized netting and trapping of game by the quantities for sale in the markets of the great cities of Eastern States and for exportation. This netting is greatly facilitated by the deep snows of midwinter. In January carloads of dead or partly frozen quail, prairie chicken, sharptail grouse and ruffed grouse are consigned to this market, some from this State, but mostly from Iowa, Illinois and Nebraska. If they meet warm weather, it often occurs that tons of them rot and are thrown away or sold to the poorest classes of the community at trivial prices. If the weather remains cold, they are sold at as low prices as fifty cents a pair for grouse and two dollars a dozen for quail. Those that are not sold here, by Feb. 1, are sent out of the State or exported to Europe or concealed in refrigerating warehouses, where they are retailed to those who have the conscience and taste to buy them. The amount exported is often a hundred barrels at a time. The amount concealed for covert retail can be judged of by one seizure by us in April last of 3,795 quail secreted in the Washington Street Refrigerating Warehouse Company by one of the members of your organization.

"This law was enacted after great and prolonged discussion. It has been in force many years. Its provisions are well-known in this State and by all dealers in other States, and its effect is to diminish the killing and exportation of game to a large extent. The very association which you have formed, great in number and wealth, and which you have incorrectly called an Association for the Protection of Game, etc., shows what a large and profitable trade you are doing in a business which, sooner or later, if not restrained, will cause the annihilation of most of the species of birds whose names I have enumerated.

"You have it in your power to stop these consignments to you during the last of December and the month of January by notifying your consignors that you will not receive them. You allow them to come forward, and ask us to aid you and them in defeating the purpose of the law, and we must decline to do so. Yours, CHAS. E. WHITEHEAD,
Counsel for Association for the Protection of Game."

A MAN EATEN BY WOLVES.—Jefferson City, Mo., Jan. 24.—I send you the following, which I clipped from one of our exchanges to-day. Perhaps it may interest some of your readers: "Kankakee, Ill., Jan. 23.—A. H. Butts, secretary of the Chicago Lumber Company, has just returned from a logging camp near Metropolitan, Mich., a point in the pineries forty miles north of Escaboine. He says the night before he left the camp the mercury had dropped to 43° below zero. This was the climax of four days of very extreme weather. That night an old trapper and Indian hunter, named Tom Duging, returning from hunting, was killed and eaten by wolves within two miles of the camp. The wolves there are more numerous and bold than usual, on account of the scarcity of small game. His friends, searching for him the next morning, found his closely-gnawed bones. Thirteen dead wolves were lying near him, pierced by his rifle balls, and his Winchester rifle by his side, with one chamber still loaded."—P. D. F.

EXPORTATION OF GAME.—Philadelphia, Jan. 31.—A prominent commission firm of this city made the statement last week that the cause of the extreme high price of canvas-back ducks now ruling was occasioned by the demand for these luscious fowl from England. Fully seven-eighths of the fowl of this description coming from the wild celery feeding grounds are shipped by order to Great Britain. The price now received for prime canvas-back ducks from abroad is $6 per pair, and they are chiefly shipped to the restaurants and cafés patronized by the upper ten on the other side of the pond. Here and even in Baltimore an order for canvas-back ducks and fixings costs $3. If the demand from England continues, next year we shall have to pay $5 for the same indulgence. Our river is full of the heaviest floating ice known for years, and on the turn of the tide the immense mass makes navigation almost impossible. Duck shooters from below are sending many fowl to market, but they are in poor condition.—HOMO.

CAPTAIN BOND SAFE.—*Editor Forest and Stream:* Your correspondent, "Homo," evidently drew upon the "first reports" as to the drowning of Capt. Bond, of Long Beach, N. J. Although I believe the captain is over eighty years of age, he is yet a skillful yachtsman and fully understands all the currents and storm freaks of Tuckerton Bay. Finding himself confronted by a dangerous gale he just ran down and took refuge at the lighthouse. After the subsidence of the storm he returned home safe and sound and ere this has doubtless read several heartfelt obituaries of himself, none of which he need be ashamed of. In a retrospect of twenty years no more pleasant hours recur than those spent with Capt. Bond, whether on the bay or on shore. I hope he may be spared to cross the bay for many a year before touching upon the unknown shore.—M. P. P. (Philadelphia, Feb. 2, 1885).

GLENCOE, Volusia County, Fla.—I have seen more woodcock in this vicinity than during any one winter since I have been in the country. They are generally seen in single pairs here, but with a good dog I can flush a dozen or so in an hour's time. I see more of them just after or during a cold "norther" than at any other time. While fire-hunting for deer recently I flushed one while walking near a swampy place; it flew up and lit not over thirty feet away. I do not think they ever breed with us, although some writers say they do. I never saw one in the summer time. Snipe, quail and doves are quite plenty. There have been very few sportsmen on the coast, so far this winter, to hunt them. This is owing no doubt to the depression in business matters and to the New Orleans Exposition. The hotel accommodations, both at New Smyrna and Oak Hill, are among the best in the State.—RED WING.

INDIANA.—Fremont.—Game quite scarce. Rabbits caught with ferrets. Five foxes caught in the neighborhood this winter.—C. Y.

Camp Fire Flickerings.

"That reminds me."

147.

A RESPECTED member of our village sportsmen's club has a 'coon dog which has long since retired from active service on account of advancing years. His owner says, "That's the greatest 'coon dog that ever anybody saw. His teeth are all gone, you know, and he couldn't kill a 'coon to save him; but he hunts just the same. And the other night I follered him, an' he chased a 'coon to the foot of a big tree, an' I'm blamed, when I got there he was a-pokin' the 'coon with his nose an' a-tryin' to make him climb the tree!" ¶

Camp-fire Flickering 145, by J. L. R. Hancock, would read better to knowing parties by stating Bedford county, Pa., not Va.—E. T. T.

Sea and River Fishing.

SNELL, SNOOD, GIMP.

IF the inquirers through the FOREST AND STREAM will try the following plan for fastening snells to hooks they will never have occasion to complain of them slipping off.

Get a roll of rubber cement such as is used to fasten bicycle tires, (it can be procured where bicycles are sold) warm the shank of the hook in a lamp sufficient to melt the cement, then draw the shank of the hook across a piece of the cement and enough will adhere to answer the purpose. Let it cool for a second to prevent it from sticking to the fingers, then press the end of the snell on in just the position you wish it to remain. After allowing the cement to stiffen a little more wrap with good thread, and if you have just the proper quantity of cement and the right consistency the wrapping thread will bury into the cement smoothly; it will be perfectly waterproof and stick to business under all circumstances. The cement also answers well to waterproof thread or cord for wrapping; use as you would cobbler's wax.

The best way to snood hooks with silkworm gut is, instead of fastening the gut directly to the hook, to fasten a small loop of relaid linen line No. 5 to the hook as directed. The loop should be quite small, not over one-eighth of an inch. Then prepare the gut by tying a loop at each end, one for attaching the hook through the small loop on hook, the other for attaching the line. Many advantages are gained by this method, the gut is double near the hook, it also forms a flexible joint and avoids the annoyance of chafing or breaking off by being bent short; in case a hook is broken another can be easily attached to the same gut. Hooks and gut can be carried separately and attached when required for use. If flies were tied in the same manner many anglers would find less occasions to lose their religion by having their flies break off where the gut joins the hook.

Canoeists will find this rubber cement excellent for stopping leaks in canoes, either joint, cracks or holes; quite large holes can be fixed up with it for cracks or joints, with a hot

iron or small stone. Melt and rub the cement well in, leave a small streak of the cement over the crack or joint. For mending a hole take a piece of canvas or boot leg large enough to cover the hole with about one inch lap all around. With a hot iron or stone smear over the patch with a good coat of rubber cement, also smear around the edges of the hole, then heat the patch quite hot and press it in place. Then smear over the whole business with cement, using the hot iron or stone. The cement will harden in a short time, when it will require no further looking after. This, of course, is only for cases of emergencies. To fix a hole permanently it should be cut out square or oblong with slightly beveling edges, then neatly fit a piece of wood to the hole, smear the edges of the piece as well as the edges of the hole with rubber cement; have it quite warm, then press the piece in place; if well done it will neither come out nor leak. No canoeist's or angler's kit is complete without a roll of rubber cement. It is *multum in parvo;* try it.

CALIFORNIAN.

THE MOST KILLING FLY.

Editor Forest and Stream:

My angling experience extending over a great many years in John Brown's tract has been that the most killing flies are the red ibis, the grizzly king and the Montreal, and in the order named. I angled the last two weeks in August of several years ago at Plumadore Pond, a few miles from Malone. I had a carefully selected stock of flies, including a good many red ibis, which I found to be the only ones the trout would take which, as they had a choice, was for me a very fortunate one, as I had no difficulty in pleasing their tastes when my red ibis flies were worn out, by substituting red flannel, which was just as killing as the feathers.

The B. A. G. is an old friend with a new jacket and no doubt a good fly. At any rate a Utica indorsement is pretty good evidence of its killing qualities. MILLARD.

BEAR CREEK, Wy., Jan. 27, 1885.

Editor Forest and Stream:

"Sport's" interesting letter on the best fly for the Colorado trout was the first thing that attracted my attention on opening the last FOREST AND STREAM. The fly "Sport" asks me to try on *Salmo virginialis* is exactly like one I have used a good deal, except that his fly from his description has no wings, but is a hackle. The fly is called by the dealer from whom I get it the black prince, and it has black wings, black hackle, black body with gold twist and a scarlet tail. In referring to my record of trout caught, I find that in the last five season's fishing thirteen per cent. of the trout caught were caught with the black prince, as against fourteen per cent by the black hackle with peacock body, and fifty-three per cent. by the coachman, while all other flies (and a very long list it is) caught the remaining twenty per cent. "Sport's" experience with the coachman is that of every one who has fished for these trout that I have seen. The coachman is by far the best fly for the trout in question, no other flies can compare with it. CYRTONYX.

FORT STANTON, New Mexico.

SUNAPEE LAKE.

IN the autumn of 1882, Dr. I. Duncan Quackenbos, of New York, leased to the Fish Commissioners of New Hampshire, for twenty years, a portion of land bordering on the largest stream that enters Sunapee Lake in New Hampshire, and on the lake shore, for the purpose of establishing a hatching house for brook trout. Sunapee Lake is the natural home of the *Salmo fontinalis*, specimens having been taken from its waters that emulate the giants of the Rangeley chain. After the first fall rains, schools of fish running from two to nine pounds in weight formerly rose from the icy depths of the lake and made their way into the shallow streams to spawn; but it is a piece of neighborhood lore that not one of these monarchs of their race ever found its way back to the deep blue waters. The spear, the club, the net, the rifle, and the revolver, were freely used by poachers and pot-hunters, whose perverted appetites found savory eating in helpless, flavorless fish, exhausted by procreation. But this is all changed now, thanks to the praiseworthy efforts of Col. Elliot B. Hodge, our accomplished Fish Commissioner, the uncompromising foe of snarers of grouse and hunters for market. From Canada to the Isles of Shoals his name is a terror to these gentry, who never know how or when he will strike. And yet the Colonel in his "hours of ease" is as tender as a woman, as devoted a lover of Dame Juliana's "dysporte of fysshynge with an angle" as "gentle Spenser, Fancy's pleasing son," whose happiest hours sped in the society of the

"Nymphes of Mulla, who with carefull heed
The silver scaly trouts do tend full well"—

or laurel-crowned Drayton, so fain to

"angle at the brook
The freckled trout to take."

Justice bids me chronicle an encounter of the Colonel's with three defiers of our game law, in October last. In company with ex-Comissioner Powers and two other assistants, he was tending his nets off the gravelly New London beach at Sunapee, when a sudden impulse seized him to return to the tank wherein swam some thirty milters and spawners, waiting to be stripped. As the Colonel drew near, he descried through the rain and darkness three figures on the tank, one dipping out five pound trout with a net and the other two receiving them. With a yell that would have done credit to a panther, the intrepid Commissioner sprang among the thieves, and utterly regardless of the great personal danger attending such an act, clutched one burly fellow by the throat, and driving his fingers and thumb into the cervical muscles of a second, forced him down into the open tank. With herculean efforts Col. Hodge, who is by no means a Samson, held his prisoners until Powers, physical equal of five ordinary men, hurried to the scene with his lantern and flashed its light into the faces of the crestfallen miscreants. If words could paint expressions, I would attempt to describe their looks. The third man was tracked and apprehended at daylight, and it took considerably more than $100 apiece to pay the bill. Six of our trout lay in the grass, too much injured to revive; the eggs were taken from the females and the narrator is happy to state that they are numbered among 70,000 at present on the screens in the Sunapee Lake hatching house. These, if hatched, will be placed in the lake next spring. Thousands of landlocked salmon are annually liberated in Sunapee. The writer saw one the other day, taken from the lake, that measured thirty-two inches in length and weighed twelve pounds when fresh from the water. This fish was less than two inches in length in 1877, the first year of the introduction of the *Salmo sebago* into Sunapee. It was captured with a live shiner, by Mr. Woodbury of Newport. A seven-pound "black spot" was taken by Moses Gould off Pine Cliff, on July 3; and a nine-pounder was speared in the New London Brook by a poacher in May. Heaven help him if we ever find him out. An unusually large number of brook trout, averaging from four to six pounds, were taken "off the banks" last summer. Anglers had better luck in capturing large fish in Sunapee than at Middle and Upper Dam, Maine.

Is it not astonishing that there are grumblers opposed to our hatching house because it adds to the burden of their taxes (precisely $\frac{1}{10}$ of 1 cent per annum) and displeased because killing five-pound trout with clubs has become obsolete? Such are kicking against the inevitable. Dr. Quackenbos owns the brook and land, and the State of New Hampshire owns the lake, and they propose to do as they please with their own property. Furthermore, private purses will open, if necessary, to make the Sunapee Lake hatching house a success, and the next man found interfering with its operations will be sure to go behind bars.

SILVER DOCTOR.

SIZE AND WEIGHT OF BLACK BASS.

IN one of your summer issues you published a table on the size and weight of black bass, by "Poke-o'-Moonshine." I clipped this table out and determined to test its accuracy. From bass caught last summer I find the following result, the length being from nose to end of tail fin:

Length.	Weight.	Length.	Weight.
15 inches	1 pound 8 ounces	17 inches	2 pounds 6 ounces
15½ "	1 " 12 "	17 "	2 " 8 "
16½ "	2 " 1 "	17¾ "	2 " 9 "
16¾ "	2 " 3 "		

These bass were all small-mouthed, and were weighed soon after being taken from the water. If any one interested in the subject will compare the two tables, they will find a vast difference in the results. For example, the smallest bass in my table, length 15 inches, weighed 1 pound 8 ounces, while the largest one in his table, length 15 inches, weighed 3 pounds 8 ounces. I would like to know if "Poke-o'-Moonshine's" bass were large or small-mouthed? If they were small-mouthed I don't see how a table can be at all accurate for different sections of the country. WOODCOCK.

SOME REMARKABLE CATCHES.

Editor Forest and Stream:

I have wondered for some time past, why the anglers who read your paper, and each week have seen so much space devoted to "Remarkable Shots," should not record their "remarkable catches," and in your issue of Jan. 15, I was more than gratified to notice for the first time one recorded by Mr. H. Jerolemon, and will add another in the hope of each week seeing more.

About the 25th of last August, with a friend, I fished in about the center of a large pond, over the ledge of a huge rock, for black bass. We had taken some good ones, and being well satisfied with our luck, were preparing to give up, when I had a bite, only a nibble, then another, and striking, I hooked a fish which, when taken in the landing net, proved to be a bass, and on taking it in my hand to disengage the hook, I discovered the entire lip of the upper jaw was gone, which prevented the mouth being perfectly closed. How it ever managed to get a living in that condition we were unable to decide; but thought it it could it was entitled to its freedom, so after hanging it by the snell of the hook on the scales, which it pulled down to 1½ pounds, it was allowed to go.

Two days after, I was fishing there again, when to my great surprise, I caught at about the same time of day the same bass, which I allowed to go as before, and within ten days caught it three times more, which made five several times I caught that bass in about fifteen days, and although there were always others with me yet they never caught it. I hope to fish in the same place next summer, and should I catch it again will let you know.

"Next." C. G. LEVISON.

BROOKLYN, N. Y., Jan. 20.

TALK ABOUT TACKLE.

Editor Forest and Stream:

I desire to thank Mr. Wells for his prompt and kindly response to my question about the click and drag. I hope I may some day have the pleasure of giving him a brother angler's hand.

I think he has given the only reasonable solution that can be offered for the use of the click and the drag. Not long since I asked a well-known maker of reels why he used both. His answer was, "Oh, well, people come in and ask for them." This of course is no reason at all. For years past I have refused to buy such a useless complication at any price, and I know there are others like me.

I shall probably be able before long to help Mr. Wells to an answer to his question in regard to aluminum-bronze. A friend, an intelligent machinist, is engaged in making experiments in this direction for use in his business. I will get him to put the results on paper.

Another question may now be in order. What is the best treatment for a fishing line to preserve it from mildew and decay? This means the whole integrity of the line.

A few more words on the barbless hook seem to be necessary to a proper understanding between "Pete" and "Petra." I was not sure, but supposed "Pete" might refer to the old needle-pointed hook, as it was called, but which is no longer made. "Pete," I apprehend, has failed to get the real "savor" of the barbless hook. Let us see what it is like. It is made from a piece of small steel wire, sharpened at both ends. One end has the usual fish-hook bend, while the other, to form the shank, is bent back upon itself and then carried over to an angle to the bend, which it meets near the point, to take the place of the usual barb. It forms, in fact, a sort of a guard, which the fish can easily pass, but which he cannot so easily repass. I fail to see any striking resemblance to the eagle claw, sockdolager, and things of that ilk, which I detest as much as anybody can. Compared with the murderous-looking gangs in common use, it is a harmless affair, and gives the fish an immensely greater chance of getting away. As to skill in handling a fish, if the phrase can be used at all, the barbless hook requires a good deal more of it than the gang, which I ceased to use years ago.

I have used the barbless hook two or three years, off and on, for trolling, and I have used it because it is merciful to the minnow. It harms him as much as a pin hook does, and no more. When you strike a fish, he is, to be sure, pretty securely hooked, but not so much so as when he has the three to twelve hooks of a gang in his mouth; and if you are tender-hearted, you have the satisfaction of knowing that you are not inflicting unnecessary cruelty. Why do we use barbed hooks at all? Simply to prevent the fish from getting away.

I care but little for trolling, and seldom indulge in it; but when I do, I am sufficiently tender-hearted to prefer the simple barbless hook to the cruel gang. In any case, I want only one hook for trolling, and prefer to depend upon that and my skill to any gang I have ever seen. I prefer to let a fish have a fair chance to get away from me, if he can, and hence I indulge chiefly in that kind of angling which affords him the chance. When I can get it, I am going to have a hook with only one barb on it.

A word as to the needle-pointed hook. I think it is underrated. It is just the hook for all high-toned anglers, and I should not object to using it. As a man, I think I could save as many fish with it as I did with a bent pin when I was a boy. Certainly there is no savor of the pot about that. PETRA.

MAMARONECK, N. Y.

TROUT FLIES.

Editor Forest and Stream:

I have noticed in several of the recent numbers of the FOREST AND STREAM, communications from anglers alluding to the confusion caused by the careless naming of trout flies. I presume a great deal of this is due to a want of knowledge on the part of some of the dealers, and also to the vanity of both anglers and dealers, who are constantly adding to the list of flies by changing slightly some old style of fly and giving it a new name. I took special pains in the plates of flies you referred to, to get correct patterns, in some cases sending to England for the authentic samples; and I believe they are generally accepted as a standard. To enable anglers to indentify their flies, I give below a list of some of the most prominent, together with a slight description of each.

The *hackles* and *palmers* are easily known by their color, and there is little trouble in keeping to their correct names. The principal ones are the "brown," "black," "gray," "red," "ginger grouse," and "coch-y-bon-dhu," sometimes known as the "marlow buzz;" the latter is a very killing little hackle, with a peacock nerl body and red furnace hackle. The name "coch-y-bon-dhu" I believe is Welsh and refers to the color of the hackle.

The *coachman* is one of the best known flies, and is a great favorite both here and in England. It is named after the fancied resemblance to the white rubber cape sometimes worn by coachman. Description: White wings, brown hackle, and peacock body. There is one variety of this fly known as the "dark coachman" a great favorite with the late Thad. Norris, the wings are lead color, otherwise the same; and another variety known as the "royal coachman," the only difference being a red tag or a red band around the body.

To Prof. Wilson ("Christopher North") we owe the celebrated *professor* and *grizzly king*. The first is tied with gray mallard wings, brown hackle, yellow body and red tail, and the latter with the same wings and tail, but gray hackle and green body.

The *Abbey* is another fancy fly and a great killer, named by the late L. H. Abbey of the firm of Abbey & Imbrie. Wings of gray widgeon, red body wound with gold brown hackle, and two or three fibers of a golden pheasant tip for tail.

The *Montreal, Canada*, and *Portland*. These three flies came undoubtedly from one pattern, but have been varied by a different reading of the descriptions. They have brown mottled wings, red or claret bodies, red tails and red or brown hackles. The "Montreal" and "Portland" vary only in being of a slightly different shade of claret, but the "Canada" body and tail is tied with red worsted. There is also a variety of the above with gray mallard wings, scarlet body and hackle, and red tail, called the "light Montreal," and another with lead-colored wings, called the "claret."

The *scarlet ibis* is famous, and is unlike any known natural fly, but sometimes very taking. It is (as are many others) greatly improved by the addition of a jungle cock feather over each wing.

The *Imbrie*, lead-colored wing, brown hackle, yellow body with black ostrich tag; the "queen-of-the-water," gray mallard wings, brown hackle, orange body; the "Rube Wood," same wing and hackle, white body with red tag and brown mallard tail, and the "south-side," are all good flies.

These, with the "St. Patrick," "silver brown," "silver black," "orange black" and "beauty" comprise the principal fancy flies, that is, flies not imitations of natural insects. Of the latter there is a very great variety and they should be tied exactly to pattern. Most of them are named after the natural fly, such as the white miller, black gnat, blue bottle, oak, etc., and the different spinners, duns, gnats, and midges.

While as a rule, trout when feeding will take almost any fly that is dropped naturally and lightly on the water, yet there are some exceptions, and it is not unusual to have them refuse everything but the one particular fly they are feeding on, so that the angler should have a pretty good variety to fall back on; it often happens that the fly that takes the best is the one our book contains the fewest of.

Since writing the above I have received the last copy of FOREST AND STREAM containing "White Hackle's" letter. Will you permit me to state in answer on what grounds I claim my plates as standards? In the first place, where possible, I obtained the patterns from the gentlemen who originated them, therefore I think my style of "Abbey," "royal coachman," etc., are nearer right than other patterns. I was agent for the celebrated McBride flies for several years and obtained John McBride's patterns from his daughter. These are so well known that it is unnecessary to speak of them.

I have been a practical fly-tyer for twenty years, and in the fishing tackle business for ten, and have sold my plates to most of the leading fly-dressers in this country.

WAKEMAN HOLBERTON.

NEW YORK, Jan. 20, 1885.

Editor Forest and Stream:

In a recent perusal of your most interesting paper, my attention was attracted to two communications in recent issues, viz., those of "Poke-o'-Moonshine" in number for Jan. 15, and of "White Hackle" in Jan. 29.

I have always refrained from expressing myself in your columns, fearing that it might be thought that I wrote from selfish motives. I frequently see opinions expressed to which I greatly desire to add my own. My thoughts for many years having traveled in the direction of fishing implements, it is natural that I should have gathered some ideas, and in

sequence adopt those which seem to me most practical and enduring.

In confirmation of the trials experienced in procuring flies, spoken of by your correspondents, I will speak of my own, and how in consequence of them I came to make flies. I had for many years made fishing rods and reels, and in filling orders for the same had frequent requests for other tackle to be sent in the same package. I then ordered, to supply these demands, small quantities of flies from the dealers—first ordering a complete line of samples with names attached. These I received, but found it utterly impossible to duplicate my orders. I was continually disappointed by the substituting of other flies or sizes than the ones I had ordered, and I, in turn, was forced to disappoint and apologize to my customer. I then thought that if there was any way out of this dilemma, caused by a confusion in names and a carelessness in copying exactly the pattern fly, I should seek it.

In time one of my family viewed with favor the idea of learning to tie flies. To this end I employed one of the best fly-tyers in the city to come to my house and stay until he had imparted his knowledge and skill, and when I felt that we were competent I advertised to fill orders exactly in accordance with directions. To this I have endeavored to adhere. I aimed only to copy accepted patterns, but no one who has not made a study of it can realize the difficulty it is to decide which is the "true and only Fiery Brown" or any other named fly. The Abbey had for many years been a favorite fly in my own use. I have in possession four varities of the fly so called, all tied by New York dealers, but I felt that the fly which came from the firm of Abbey & Imbrie ought to be adopted as the correct standard, and therefore have aways tied an Abbey or an Imbrie fly precisely like the flies sold by that firm, feeling that they were the ones to establish a standard for the flies to which they had given their names.

In looking through my fly-case I often call to mind the history of each variety, and I sometimes wonder if a little memorandum of the same would in time become of interest.

The royal coachman mentioned by "White Hackle" was first offered to purchasers by me. It did not, however, originate with me. The fly-tyer I mentioned long ago sent to me a sample of the same, saying, "I have just been tieing some flies to order for a gentleman. He says he likes the coachman better than any other fly, but he finds it very frail, and he wants me to tie some with red silk in the middle, to make them stronger, and he also wants a little sprig of wood duck for a jib (tail). I send you a fly to see. I think it quite handsome."

This inclosed fly had a white wing, brown hackle, peacock body, bound in the center with red silk, and tail of wood duck feather with the black and white bars. I kept this fly for some time, showing it to several people. One evening a number were gathered around a table looking at the flies. My family, Mr. Horace T. Dunn, of California, and Mr. L. C. Orvis, of Hartford, Conn., were present discussing the propriety of every fly having a name, numbers giving them little or no individuality. I said, "But what is one to do? I do not propose to name flies. We have too many names already." "Why not?" say they. "If you make a new combination name it. Else it will never be popular. No one can remember to distinguish flies by numbers; they get confused. A name fixes a fly in your mind." "Well," I answer, "that may be; but look, here is this fly, a handsome fly; it is similar to a coachman, but it is not a coachman. There is but one coachman; that is the fly we all know, with a white wing, peacock body and brown hackle."

"I will tell you," exclaimed Mr. L. C. Orvis, "that is an extra fine coachman; all that scarlet makes it quite magnificent—call it—call it—the royal coachman!" This seemed suitable, so the fly was christened. Not long after I published a list of flies, and included the "royal" coachman in the number.

Later I received a letter from an angler in Wagon Wheel Gap, Colorado, saying: "I wish you would make a coachman for me with all the gilt on it possible. I believe such a fly would be stronger and more taking."

We tied the flies, making the body of gilt, with only a neck or ruff of peacock hurl, and it proved most acceptable both to the man for whom it was designed and to the fish of Colorado. We have made many dozens for that country, and it seemed too good a fly not to be added to the list, so the "gilt" coachman received a place.

The red-tip coachman and lead-wing coachman had been known in the trade long before I entered it, but I feel responsible for the innovation of the royal and gilt coachman, and here confess and account for the same.

I make a fly called the "Holberton," which was obtained of him (Mr. Holberton) by a gentleman in New York as the genuine. This I call the Holberton, and endeavor to adhere to the pattern in every shade and droop of feather, and twist of silk and tinsel.

"Pcke-o'-Moonshine" refers to a fly called "B. A. G." as follows: "From his description which says, 'It has white wings, dark red hackle legs, and red body, in fact a coachman with a red body, if such a thing is possible.' We would here like to interrupt "Pokc-o'-Moonshine" with "No, such a thing is not possible; with the absence of peacock hurl it is no longer a coachman; the royal coachman is not really a coachman; neither is the so-called gilt coachman, but they still retain more of the elements."

I will tell you of a case I once knew. A worthy and inventive man confided to me the plan of a new rotary steam valve, and wanted me to help him about his models. I admired his invention and the patient study which had originated and perfected the idea, and believed the man had a fortune within his grasp. I did not see him again for some time, but when I did, inquired after the rotary steam valve. The man leaned toward me and said, "Do you know, a deluded K—ss down in New Jersey has invented one exactly like it. When I began to investigate I found he was in ahead of me." "But did you know him; did he know anything about your idea?" I asked rapidly. "No, no, it was all right, only he was ahead of me a little; he had never heard of me or I of him."

I am reminded of this case when I read of the fly with a white wing and red body, and red hackle, which "B. A. G." says originated in Utica, N. Y.

One delightful spring day, a few years ago, a worthy and rather elderly brother-in-law of mine came to the house, and with a most satisfied smile on his jovial face, said:

"I am going to drive to Bennington, and I know a stream where there are some fish and I'll show you people a string of trout that will make your eyes shine; but I want you first to make a fly for me. You know I always use a coachman; it is the only fly of any account anyway. I don't want any of your new, fancy flies; give me a coachman every time. But I always put on the hook a fin of a fish. You are not apt to catch fish unless you do. Now, I want you to make a fly just like the coachman, only don't put that peacock body on, that always wears off; but make the body of silk, the same color as a fish's fin."

This we did, and he started off jubilant, believing this "*the* fly." He reported great success with it, and it was afterward tried by others to whom we suggested it, and so sprang into existence the fin-fly. I do not know the history of the origin of the B. A. G. in Utica, but it may, too, have been from the old, familiar idea of the efficacy of the fin of a fish as an allurement.

I have only cited these examples to show you that new combinations may be made and there be no desire to conflict with the old. I am most desirous of conforming with some established standard, and in the fly-plates of the book called "Fishing with the Fly," great care was taken to trace flies, as far as possible, to their origin and then to give the original type as introduced by its inventor.

Dr. Henshall gave me formula for the Polka, Oriole, Henshall and "Oconomowoc." They were tied according to descriptions and he pronounced them correct. As he was the originator of these flies, what better can we do than follow his prescription?

I think Mr. Wells will vouch for his own "Parmacheene Belle." A fly in the plates which he says is similar, was one made to order, and the one for whom it was made called it "a Professor! I with a white wing." This we could not bring ourselves to do, so we simply said it had no name, until in time it came to be the "no name."

Mr. Cheney will undoubtedly defend the Cheney bass and trout fly. Major Ferguson, of Maryland, gave us a correct pattern of the fly to which he lends his name. (This pattern did not reach us in time to be represented in fly-plates in "Fishing with the Fly." The Ferguson there illustrated is slightly different from the fly given us by Major Ferguson, but it is like the generally accepted design used and sold. The difference would not be noticed by many.)

Mr. Thomas Williamson, of Leesburg Academy, Virginia, sent us a fly of his own tieing, with feathers, that we might copy it; and said he found the fly a most taking fly for black bass in those waters, and should call it "the academy," and so on.

We had more difficulty in determining upon the true Montreal than upon any other fly. We obtained flies of this name from many dealers and many fishermen; there were numerous varieties, but the majority seemed to unite upon a brown turkey wing, claret body and hackle. We then wrote to Forest & Sons, Kelso, Scotland, feeling that they might well be referred to as of highest authority, for who ties a more beautiful fly or duplicates more exactly than these artists? They replied, indorsing the brown turkey wing, claret body and hackle, and scarlet ibis tail (body wound with gilt). We then made the fly after the sample furnished by them, and in accordance with the generally accepted method in this country and Canada.

For a white miller, where can we better go for a type than to the fat body, tipped with orange, and the fluttering white wings of the familiar insect? This can be well represented by white silk chenille for the body and orange silk for the tip of body, and who ever saw a white miller with other than white wings?

I am tempted to write on indefinitely, but fear I have already transgressed beyond my proper space. I will therefore add, that the only way I can see out of the dilemma of confusion is for all to enter our flies, and have their name, pedigree and points properly registered. I, for one, will conform strictly to rules. But seriously, why not announce the new flies. If they prove good and we find them worthy a name, they are worthy the notice and interest of all fly-fishermen, and we will then know who is responsible and to whom to refer for the proper type. CHARLES F. ORVIS.

MANCHESTER, Vt.

Fishculture.

FISHCULTURE AS AN INDUSTRY.

MR. MILTON P. PEIRCE, of Philadelphia, Pa., the official fishculturalist of the Pennsylvania Board of Agriculture, delivered before that body and the Legislature last week an address on "Fishculture as a Pennsylvenia Industry." During his address he quoted two or three times from the FOREST AND STREAM, communications from Pennsylvanians, particularly that signed "Penn" in our issue of January 15, headed "Trout Brooks." Referring to the costly attempts, during the past quarter of a century, to solve the problem of keeping original trout streams supplied with this peerless fish, he remarked that "Penn" had presented the only practical solution, which, when duly analyzed and condensed, was simply to leave the streams in a state of nature, and, he added, not only the streams but their immediate surroundings must be so continued. He claimed, that for even so small a stream as that described by "Penn," a strip of at least fifteen feet in width of brush along its banks would be required to furnish adequate shade and resorts for insects upon which the trout feed. Taking this area including the stream with other dates furnished by "Penn," he found that the sum of areas amounted to three and seven-elevenths acres devoted to this only practicable method of trout culture. From this area, according to "Penn's" data, not much if any more than ten pounds of trout could be taken annually. Then, quoting "Penn's" final paragraph as follows: "If as much effort were put in this direction as is being made in the raising of German (?) carp, the result would be better both for the angler and the epicure" he said, the same area of properly constructed carp ponds devoted to the culture of our improved types of American food carp, would produce a yield of fully three and a half tons annually of fish second in quality only to trout.

CARP IN VIRGINIA.—Louisa County, Va.—My experience with German carp has been somewhat at variance with the published statements I have seen on the subject. First—They do not hibernate in this climate, but are freely in motion whenever the ponds are not covered with ice. I have fed mine on the surface of the water repeatedly this winter (with crackers) when a part of the pond was covered with ice. Second—If properly attended to and pushed in their growth by feeding, as soon as they are large enough to eat powdered cracker, I believe they will spawn at one year old. I am satisfied of this from the fact that I dissected, last month, a young carp six inches long (spawned May, 1884), and found an abundance of eggs in it, not quite as large in size as clover seed; it no doubt would have spawned in the spring of 1885. Third—As to their readiness to take the hook, they are as vigorous biters as any angler could desire, and for a short time are very strong and active, but soon give up the struggle. I have hooked them with a bait of corn bread and with wheat bread, with worms, boiled Irish potato, and once, when fishing for a turtle with a piece of minnow for bait, I unexpectedly and undesignedly caught a three-pound carp. Their table qualities are excellent if they are skinned before being cooked. Their worst enemies are the minks, otters, muskrats and snapping turtles. It is easy, with a shotgun, to kill the snakes, cranes, Indian hens, kingfishers, etc. I shot an otter in one of my carp ponds a few weeks since, that measured 4 feet 1¼ inches from tip to tip, and on cutting him opan to see how many carp he had caught, to my astonishment found him full of crawfish, and nothing else.—P.

SHAD LEGISLATION WANTED.—The State Fishery Commissions of Pennsylvania and New Jersey held a conference at Trenton, on Tuesday last, for the purpose of arranging for an application to the Legislatures of the two States for concurrent legislation in regard to the shad fisheries of the Delaware River. The fisheries are declining yearly in yield, and unless something is done to secure greater immunity to the fish from almost constant pursuit, the catches of the future will be still smaller. It is proposed to have an intermission of the fishing from Saturday morning at sunrise until the corresponding time on Monday morning of each week, instead of from sunset of Saturday evening until sunrise Monday morning. Legislation of the same kind will be asked for the Susquehanna River, the Maryland having agreed to act with the Commissioners of this State.—HOMO.

The Kennel.

FIXTURES.

BENCH SHOWS.

Feb. 4 to 11, 1885.—New York Fanciers' Club, Third Annual Exhibition of non-sporting dogs, poultry and pigeons at Madison Square Garden. Chas. Harker, Secretary, 62 Cortlandt street.

March 5, 1885.—World's Exposition Dog Show, New Orleans, La. Entries close Feb. 23. L. F. Whitman, Superintendent.

March 18, 19 and 20, 1885.—Second Annual Show of the New Haven Kennel Club. E. S. Porter, Secretary, New Haven, Conn.

April 7 to 10, 1885.—First Annual Dog Show N. E. Kennel Club, Music Hall, Boston. J. A. Nickerson, Secretary, 159A Tremont street.

April 21, 22 and 23.—Annual Dog Show of the St. Louis Gun Club. W. A. Albright, Secretary, St. Louis, Mo.

April 28, 29, 30 and May 1.—Ninth Annual Dog Show of the Westminster Kennel Club at Madison Square Garden. Entries close April 14. R. C. Cornell, Secretary, 54 William street, New York.

May 5, 6, 7 and 8, 1885.—Second Annual Dog Show of the Cincinnati Sportsman's Club, Cincinnati, O. W. A. Coster, Superintendent.

May 13, 14 and 15,—Third Annual Dog Show of the Toronto Dog Show Association, W. S. Jackson, Secretary, Toronto, Ont.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1987.**

NEW ORLEANS DOG SHOW.

NEW ORLEANS, Jan. 31.—The entries are coming in at a good rate. The show will be held in the Exposition grounds, in a building set aside especially for that purpose, and will open March 5 and close on the night of the 11th, quite a long time to keep the dogs confined, but to counteract the bad effects thereof, I shall have two yards of nearly an acre each to exercise them in. The building is large and will admit of benching a large number of dogs. The managers of the Exposition are now considering my proposition to offer a supplementary prize list that will, with the regular premium list, aggregate double the amount ever offered at any show before. I am receiving letters from all parts of the United States and Canada requesting entry blanks. I am expecting a large entry of foxhounds, as there will be given a miniature fox hunt on the grounds, which are very commodious; also a coursing match for greyhounds. I can from the present outlook safely say that the show will be first-class in every respect. L. F. WHITMAN, Superintendent.

THE CRYSTAL PALACE DOG SHOW.

OWING to late arrival of the European mails we are compelled to defer until next week the report of this show from our special correspondent. The following is taken from the London *Field:*

In May, 1863, the first international dog show was held in Islington Agricultural Hall, and its novelty was such that no fewer than 1678 entries were made. We are not aware that any of these were duplicate entries, and as the hounds, with few exceptions, competed in three couples, and pointer and setter puppies in braces, the actual number of dogs shown was even greater than the figures given above. Thus the twenty-fourth exhibition, under the management of the Kennel Club, which opened at the Crystal Palace on Tuesday, and closed yesterday, with its 1,623 entries, is not a "best on record," as many imagined, though the largest ever held by this body. The previous winter show had 1,507 entries. Still, there are many animals competing in more than one class, about 140, and the actual number of specimens on the benches must be taken as minus the latter figures. Column after column has been written condemnatory of the arrangement of these Crystal Palace shows; they bring considerable "grist" to the coffers of the company, and the pity is great that the Kennel Club is not better served in the matter. We shall not be surprised to find a change in the location, shortly, for a building admirable in every way for the purposes of a dog show, and quite as easy of access, even more so than Sydenham, is not far from completion.

As is usual at this season of the year, the dogs were benched in the galleries, and, as is likewise usual, were judged in five different rings, here, there, and everywhere almost, yet still in corners difficult to find, and generally too much cramped and incommodious when they were reached. This was especially the case with the larger dogs, the St. Bernards and mastiffs for instance, and the collies and fox-terriers, too, had none too much space in which to show their action and agility. Opportunities for displaying their worst features and temper were far greater. On the benches, too, one would like to see more space allowed, but here there was little else fault to be found with the arrangements, for the fittings, by Messrs. Spratt, were of the best, and straw and water were provided in abundance. Still, the numbers did not run on consecutively. The disinfecting, too, by Messrs. Jeye's purifier, appeared to be quite successful, and all went smoothly and satisfactorily, for both Mr. Stephens, the secretary, and his right-hand man Edwards, appeared to be more than usually energetic. The committee were sadly neglectful at the rings, and the telegraphic boards were either absent or not utilized with that regularity which is due to the public. Again, there was great delay in putting the prizes over the successful dogs, and in some cases where the latter were judged on the Tuesday, the labels were not placed when we left on Wednesday at dusk.

With delay as usual in the judging, this did not get properly under way much before 10 A. M. on Tuesday, was continued until well into the evening in a wretched light, and not concluded until Wednesday. The Dandies and Irish terriers were attended to on the latter day, when there was not a committeeman or official to see the animals taken into the rings, and the last prize was not given until 3:30 P. M. The gentlemen

who made the awards were as follows: For bloodhounds and St. Bernards, Mr. Neville Wyatt; mastiffs and deerhouns, Lieut.-Col. Wyatt; Great Danes, Mr. Raymond Bryan; greyhounds, Bedlingtons, Scotch and Skye terriers, and poodles, Mr. John Douglas; Newfoundlands, Mr. W. F. Bagnall; setters, fox-terriers and Irish terriers, Mr. J. A. Doyle; wire-haired terriers, Mr. Percy Reid; pointers, Clumber spaniels, Bassets and dachshunde, Mr. W. Arkwright; spaniels, Mr. T. B. Bowers; retrievers, Mr. E. G. Farquharson; sheepdogs, Mr. Byron; bulldogs, black and tan terriers, and smooth toys, Mr. A. C. Jackson; Dandies, the Rev. W. J. Mellor (in the place of Major Ashton); pugs, Mr. W. L. Sheffield; Yorkshire, Maltese, bull and smooth terriers, toy spaniels, rough toys, foreign dogs and Chow-chows, the Rev. G. F. Lovell.

When the gentlemen as above were first announced, the selection was severely criticised, for many were new hands, and some of the older ones had classes assigned them, their knowledge of which was not of a public character. It was considered Mr. Doyle would have quite enough to do with the fox and Irish terriers, without undertaking the important setter classes. As a judge of the latter, excepting Irish, he now made his debut at a big show. Mr. Byron's qualifications to take collies were likewise criticised, but the two hundred entered showed the public were not against his appointment; indeed, generally, the number of exhibitors proved greater satisfaction with the appointment of judges than we were at first led to expect. Following this, and having doubts as to the capabilities of some of them, the unsuccessful exhibitors should have been satisfied. They were not; and, taken all through, it was never our unpleasant lot to attend any show at which so much fault was found with the awards. This was not in one class alone, but in a score; and the Kennel Club is by this time aware that such fault finding was not without cause. Another grumble as to the hardship experienced by visitors, not exhibitors, who for luncheon had either to be content with a bun or sandwich and a drink, or be mulcted in an extra half-crown to re-enter the show after visiting the dining-rooms below.

The quality of the gathering throughout was undoubtedly good, still not more so than usual, and the number of puppies of course militated against its uniform excellence, placing it in this respect behind that at Curzon Hall last December. The best classes were undoubtedly the St. Bernards, mastiffs, Great Danes, pointers, collies, fox-terriers, dachshunde and bulldogs. The setters were disappointing, as were spaniels; but retrievers, bloodhounds and Newfoundlands were quite up to the mark, and it was doubly gratifying to find such an excellent display of deerhounds, a fine, intelligent and representative breed, with a tendency toward retrogression. Shall this improvement at the Palace be taken as a "turn in their tide?" The more fancy varieties of terriers, toy dogs and toy spaniels, pugs, and variety classes were about as numerous as usual. There have not often been better shows of Dandie Dinmonts.

We give below a list of the principal

AWARDS.

BLOODHOUNDS.—Champions—*Dogs:* Prize, M. Beaufoy (Nestor). *Bitches:* Prize, O. Hills (Witch).—Open—*Dogs:* 1st, E. Nichols (Pharaoh); 2d, L. G. Morrell (Maltravers); 3d, J. C. Tinker (Duncan). *Bitches:* 1st, C. A. G. Hutton (Helen II.); 2d, E. Nichols (Nita); 3d, O. Hills (Morgiana).

MASTIFFS.—Champions—*Dogs:* 1st and cup, Mrs. G. Willins (Maximilian); 2d, W. K. Taunton (champion Cardinal). *Bitches:* 1st, Dr. F. J. Campbell (champion Lily II.); 3d, J. Evans (Elaine).—Open—*Dogs:* 1st, E. Nichols (Goth); 2d, J. Hutchings (Titus); 3d, R. Cook (Ilford Caution); 4th, E. A. Cheeseman (Bruce VII.). *Bitches:* 1st and cup, H. G. Woolmore (Cambrian Princess); 2d, E. Nichols (Queen Ann); 3d, J. S. Turner (The Lady Isabel). A very good class.—Puppies—*Dogs:* 1st, M. Beaufoy (Beauchamp); 2d, J. R. Catterall (Prince Cole). *Bitches:* 1st and 2d, W. Rollinson (Demeter and Danaides).

ST. BERNARDS.—Champions—*Dogs:* 1st, S. W. Smith (Valentine); 2d, C. Macdonna (champion Bayard). *Bitches:* 1st, H. C. Joplin (champion Elfrida); 2d, J. Edwards (champion Amy).—Open—Rough—*Dogs:* 1st, S. W. Smith (Merchant Prince); 2d, H. J. Fulljames (Grip); 3d, A. Ward (Landgrave); 4th, W. G. Marshall (Pilgrim. Produce prize, F. E. F. Polhill-Turner (Marco III.). *Bitches:* 1st, H. H. R. Chapman (Lady Eva); 2d, L. C. R. Norris-Elye (La Mascotte); equal 3d, F. E. Coleman (Maggiore), and L. C. R. Norris-Elye (Crevasse II.).—Smooth—*Dogs:* 1st, R. Thornton (Eriot); 2d, W. Soper (Lion III.). *Bitches:* 1st, J. Valentine (Ida II.); 2d, W. B. Megone (Bon Bon).—Rough Puppies—*Dogs:* 1st, W. Cox (Rothley Romeo); C. Macdonna (Bosco II.); 4d, F. E. Emerson (Oliver). *Bitches:* 1st, S. Smith (Mena); 2d, W. Porter (Royalty); 3d, J. McCullock (Florida).—Smooth Puppies: Prize, A. Deakin (Rosebank Royal).

NEWFOUNDLANDS.—Champion—Black—Prize, E. Nicholls (champion Nelson I.).—Open—Black—*Dogs:* 1st and cup, E. Nichols (Lord Nelson); 2d, R. W. Moil (King Bruce); 3d, Miss A. Bryant (Rossmore). *Bitches:* 1st, Mr. G. Chapman (Lady Teazle); 2d, E. J. Bird (Isla).—Other than Black—*Dogs:* 1st, H. F. Marshall (Romeo); 2d, D. Palmer (Turpin). *Bitches:* 1st, D. Palmer (Clio); 2d, J. H. Evans (Leonora). *Puppies:* 1st, G. Chapman (Lady Teazle); 2d, E. Nichols (Admiral Keppel); 3d, A. Stevens (Aaron).

GREAT DANES.—Champions —1st, C. Petrzywalski (champion Sultan II.); 2d, W. A. Callaghan (Harlequin Nero).—Open—*Dogs:* 1st and cup, R. L. Pemberton (Cedric the Saxon); 2d, E. G. Greenep (The Slogger); 3d, M. Riego (Cid Campeador). *Bitches:* 1st and cup, C. Petrzywalski (Mirza); 2d, R. L. Pemberton (Fair Rosamond); 3d, S. E. Shirley (Nox).—Puppies—*Dogs:* 1st, S. E. Shirley (Tonans); 2d, E. G. Greenep (The Pirate). *Bitches:* 1st, M. Riego (Linda); 2d and cup, E. Wootten (Empress of Germany).

DEERHOUNDS.—Champion—1st, P. Cooper (champion Bevis I.).—Open—*Dogs:* 1st, H. P. Parkes (Gunnar); 2d, Mrs. A. A. Corder (Warwick); 3d, H. C. Joplin (Clansman). *Bitches:* 1st, W. Gordon (Beatrice); 2d, H. P. Parkes (Heatherbelle); 3d, C. H. Lane (Lara).

GREYHOUNDS.—*Dogs:* 1st, H. C. Joplin (champion County Member); 2d, J. G. Bridge (Orsett). *Bitches:* 1st, H. Pattenden (Sing Song); 2d, T. Sharples (Caroline).

EXTRA CLASS.—Foreign Dogs—Champion—Prize, W. K. Taunton (Captain Burton).—Open—Prize, W. R. Taunton (Oscar Franklin), Rev. A. Carter (Kushki), W. P. France (Beauty II.), R. Todd (Derwent Jumbo), A. B. Woodd (Hruni), and Miss A. Bodley (Bruno).

POINTERS.—Champions—*Dogs:* Prize, E. C. Norrish (champion Graphic). *Bitches:* Prize, Rev. W. Sheild (Glee).—Open—55lbs. and upward—*Dogs:* 1st, E. C. Norrish (Paragon); 2d, Mrs. Graham (Don IX.); 3d, B. Field (Young Dick).—50lbs. and upward—*Bitches:* 1st, E. C. Norrish (Revel III.); 2d, C. Bishop (Amber II.); 3d, T. B. Ewens (Dapper).—Under 55lbs.—*Dogs:* 1st, Prince A. Solms (Naso of Kipping); 2d, R. P. Leach (Bracket); 3d, B. Field (Dick III.).—Under 50lbs.—*Bitches:* 1st and cup, C. Drury (Aldin Rose); 2d, R. J. L. Price (Codiad yr Hedydd); 3d, Lieut.-Col. H. C. Legh (Devon Doll). *Puppies:* 1st, J. F. H. Harter (Bell of Cranfield); 2d, E. C. Norrish (Paragon).

Fulton (Sampson).—Rough-haired—1st and 2d, Mrs. M. A. Foster (Lady Monck and Daisy); 3d, C. Walker (Dreadnought).

DOG BISCUIT.—*Landlady*—My boarders are welcome to eat all they want, but I object to their carrying food away in their pockets. *First boarder*—The biscuit I put in my pocket I wanted for a savage dog I meet on the way home at night. *Landlady*—I cannot afford to bake biscuit for the dogs of the neighborhood. *First boarder*—I didn't mean to feed it to him; I meant to crack his head open with it. *Second boarder*—Oh, I thought you wanted him to swallow it and expire of indigestion.—Meat-Hawk.

NATIONAL FIELD TRIALS CLUB.—Office of the President, Cincinnati, O., Jan. 31.—*Editor Forest and Stream:* Mr. J. K. Reneaud, having resigned as secretary of this club for current year, on account of private business engagements requiring his whole time and attention, Mr. B. C. Stephenson, of La Grange, Tenn., has been unanimously elected by the executive committee as secretary for the year 1885.—W. B. Shattuc, President.

AT THE FANCIERS' SHOW, now in progress in this city, there are 71 entries, with puppies to bring the number up to about 100. At the time we went to press the entries were not all benched, and it was impossible to judge of the merits of the display.

ST. JOHNS SHOW.—The report of the show arrived too late for the current issue. It will be given next week.

Everyone interested in dogs should secure a copy of "Our Friend, the Dog," a pamphlet just issued on the care of dogs in health and sickness, with a list of canine diseases alphabetically arranged, and the symptoms and prescriptions for their cure. Mailed for 2-cent stamp by addressing Associated Fanciers, 237 South Eighth street, Philadelphia, Pa.—*Adv.*

Rifle and Trap Shooting.

RANGE AND GALLERY.

SARATOGA SPRINGS, N. Y., Jan. 26.—The attendance for the past week, at the Glen Mitchell Range, was fair, and the conditions being favorable on both shooting days, some good scores were put up. The Massachusetts target was used, distance 200yds. off-hand. The following are the highest scores of each man for the week:

I Davis	12	11	11	10	11	11	11	10	12	10—109
W B Gage	12	10	10	11	9	10	12	10	12	11—107
I D Roods	8	12	10	12	12	12	11	9	11	9—106
A G Hull	10	9	12	10	11	11	12	9	10	11—105
W H Gibbs	10	9	9	10	11	10	12	10	10	12—103
S F Corey	9	11	9	11	11	9	10	10	11	13—103
A F Mitchell	8	9	11	11	11	12	11	11	10	9—103
F A White	10	12	12	9	9	10	10	12	12	10—103
A C Rich	9	9	11	10	11	12	8	11	12	9—102
H Wellington	11	9	10	10	12	12	10	8	8	10—100
E R Stevens	12	9	8	9	10	10	8	10	10	10— 96

BOSTON, Jan. 31.—There was an average attendance of shooters at Walnut Hill to-day. The conditions were favorable, the wind blowing gently from the southwest. H. Cushing made a clean score of 50 on the Creedmoor target, and 88 on the decimal. The score:

Victory Medal Match.

C E Berry	8	10	8	5	6	4	9	8	10	9—77
R Reed	5	6	8	10	7	8	7	0	7	7—75

J E Darmody (mil.)	4	5	3	4	3	4	3	4	5	3—38

BRIDGEPORT VS. NEW YORK.—On the morning of the 27th ult., although the thermometer registered extreme cold, the members of the Bridgeport Rifle Club went down to Morrissania by the 8:40 train to shoot the second of their "Home and Home" matches of the New Yook Rifle Club. A cold walk to the range from the West Farms station rendered the warmth and cheer of landlord Genez's snug hostelry doubly acceptable to the chilled riflemen, who speedily thawed out both their outer and their inner man. About 10 o'clock shooting was begun from the shooting house below the hotel, and soon the match was in full blast. Almost at the first a miss signaled for Howlett, the New York Club's redoubtable captain, who promptly challenged the correctness of the marker's decision, and had a cold walk to the targets and back only to find the marker in the right. A miss was also scored Todd on his tenth shot. The conditions of the match called for teams of 7 men, firing 15 shots each at the Massachusetts target over a 200yd. range. This made a possible 180 per man. The scoring was very fine indeed on the part of the winners, and stood:

Bridgeport.

D E Marsh	12	11	11	10	11	12	11	11	11	9—160
S H Hubbard	11	10	10	9	11	11	11	10	10	11—157
F A White	11	10	8	9	9	9	12	10	11	11—153
P M Beers	9	9	8	10	11	11	11	10	11	11—148
E Nothnagle	8	9	10	11	10	9	9	7	10	10—146
W H Beardsley	10	10	9	10	9	10	10	8	11	9—146
G Quitmayer	10	8	9	8	11	6	8	9	8	10—145

New York.

J Duane	10	8	12	10	10	11	11	12	10	9—154
G Zimmerman	10	10	12	9	12	8	10	9	10	10—148
A McInnes	10	7	8	9	12	11	10	4	9	11—145
J H Brown	10	10	9	11	11	9	9	10	10	12—140
W Simpson	6	9	10	9	11	10	10	10	8	7—135
A J Howlett	10	0	8	9	8	11	9	12	8	9—135
J W Todd	11	6	11	8	10	5	10	8	10	0—120

Some idea of the performance of the winning team may be gathered from the fact that of the 105 shots which constituted the full quota of 15 per man, but two bullets were more than 15 inches away from the exact center of the bullseye. The Bridgeport men did good uniform shooting throughout and their team total of 1,045 is a very creditable one. Mr. Marsh's 160 being a specially fine effort, which by Creedmoor count was 71 out of a possible 75 with two of the four centers nipping the bull. Though the New Yorkers were generally in very poor form, it is but just to the Bridgeport men to admit that they would have won in any case. The moral of all this is that the New York men must better themselves and practice more diligently if they hope to make a better showing at the next contest.

After the contest the Connecticut boys went to Conlin's record gallery, 1,255 Broadway, to try their hands at the Renette French target. The result below shows that these knights of the trigger are capital at indoor work as well. The distance at which the French targets is shot at is 16 metres; the bullseye is ¾in., and the carton is ⅝in. The following are the scores made out of a possible 70:

First team, S. H. Hubbard, captain—S. H. Hubbard 63, E. Nothnagle 59, G. E. Betts 53, P. M. Beers 52. Total 227.

Second team, A. C. White, captain—A. C. White 59, D. E. Marsh 61, W. H. Beardsley 58, C. Patterson 40. Total 218.

PATERSON, N. J., Feb. 2.—The Paterson Jaeger Rifle Club is divided into three teams, who compete for three gold badges every three months. The badges are awarded to the one making the highest score in each team respectively. The condition of the shoot is that the first ten shots each man fires on each Monday evening during the three months are credited as his score. The distance of the range is 40yds. A Stevens .22 short caliber rifle, weight 7lbs., is used, with a Creedmoor target reduced. In a possible 660, or 13 scores of a possible 50 each, the score stood:

Team No. 1.													
J W Johnson	46	44	43	42	41	43	43	39	41	47	43	42	43—557
Wm Barr	41	39	44	41	41	42	48	46	42	43	40	39	38—544
H Mertle	45	43	39	38	40	44	43	41	43	44	42	40	41—543

E Mead	33	40	43	35	42	41	38	41	88	50	42	44	36—518

Team No. 2.—T. Stoner 489, J. Tounley 458, T. Moran 488.

VIEWS ON REVOLVERS.—*Editor Forest and Stream:* Seeing the remarks on revolvers, I would wish to briefly state my idea about the matter. In my estimation most revolvers are too light for the caliber. My idea of a revolver is the same as that of ".22-Long's," only on a larger scale. I would prefer a revolver about the size of the Smith & Wesson .44, but only be a .38-caliber. But as I understand, the Smith & Wesson manufacturers do not make revolvers to order; so I prefer the .44, for when you do hit you will kill where, if you had a smaller caliber, you would not. Another thing I agree with "22 Long" in revolver cartridges. If I understand right, the Smith & Wesson .44-caliber cartridge only has 23 grains of powder and over 200 grains of lead. Now that is a proportion of 1 to over 10, when I believe it should not be over 1 to 5 or 6, and then I honestly believe we would have pretty fair shooting with that kind of a revolver.—BRO. TO SIPPO.

BULLSHEAD RIFLE CLUB, Jan. 20.—12-ring target, possible 120: G. Zimmerman 119, M. Dorrler 116, C. Rein 116, H. Stolzenberger 109, H. Millen 106, H. Wasmuth 102, D. Holland 99, J. Wetje 96, J. F. Campbell 95, D. Lowitzki 92.

PITTSBURGH, Pa.—The annual meeting of the Pittsburgh Rifle Club was held Jan. 9 and the following officers elected: President, Dr. J. A. Jacobs; Vice-President, Geo. Hodgdon; Secretary and Treasurer, Louis Brehm; Executive Officer, Capt. Thos. Rose, U.S.A. Directors, the above officers, ex-officio and W. H. McClelland, Jos. Huggins, Jesse B. Jones, M. Schroder, Geo. Weibel, F. Stolte and Dr. W. H. Winslow. The 1,000yd. range has been abandoned, and the club has an excellent 200yd. range with sliding targets, pit and a warm shooting house at High Bridge, Castle Shannon Railroad, where a dozen or more of the thirty-five members may be found hard at work every Thursday afternoon the year round. The Massachusetts decimal target is much liked, and much regret is expressed that it is not more extensively used by others.—W. H. W.

THE TRAP.

THE NATIONAL ASSOCIATION.

Editor Forest and Stream:

Over thirty active names have been added to the committee list. All will admit that something should be done to organize large tournaments yearly, as well as adopt national rules. It is to be hoped that sportsmen throughout the country will lend their active aid to making the present effort a success. If this opportunity is lost, there may be no other for years. In addition to the objects already announced in the prospectus, I would recommend that the following be added, viz: To assist gun clubs, and State or sectional associations in organizing large local tournaments; so that if any clubs, being members of the National Association, see fit to organize tournaments, they will receive the active aid of the National Association, both in money and in labor of its officers, to make such tournaments a success.

With reference to membership, I would suggest the following three distinct groups, embracing six different classes, viz:

Individual membership.—1.—Honorary members. 2.—Life members. 3.—Active members. Fees as announced in the prospectus.

Club membership.—4.—Clubs and associations already organized, or which may be organized without any assistance from National Association. Initiation fee, $3 per member; yearly dues $1 per active member. 5.—Clubs organized under auspices and aid of the National Association. Initiation fee, etc., same as class 3.

State association or any sectional organization membership.—6.—When organized and consisting of at least three clubs. Initiation fee, $2 per member; yearly dues, $1 per active member.

Annual members only shall be allowed to shoot at tournaments held under auspices of this association, or under the auspices of any club receiving any prize or assistance from this association in managing said tournament; or any tournament held under the auspices of a club which has been founded under the auspices of this association, they will be allowed full privileges of using the main office of this association and of any club rooms, etc., which the latter may establish; and to wear the badge of this association, which shall entitle the wearer to enter gratis the grounds where any tournament is in progress under the auspices of this association; they shall be entitled to the printed reports gratis, which shall embody constitution and by-laws, national shooting rules, latest legal decisions, announcements, etc.; will be allowed to appeal to the committee on grievances, on rules and on law, for the settlement of any and all controversies—thus obtaining the benefit of "a court of last resort," which shall interpret the shooting rules, and whose decision shall be final.

Owners of capital stock only shall be entitled to the annual dividends accruing from profits of tournaments, etc.; shall be entitled to vote at election of directors and at annual meetings.

Associations or clubs, being members, shall also be entitled to have names and addresses of officers and scores at two principal matches published in annual report; to receive the bronze medal of this association for competition among its members.

Members of clubs and associations, already formed, are enabled to materially reduce their iniation fees—provided such clubs and associations join in a body. It is hoped that this and the foregoing reason will induce existing clubs to join the National Association. However, even if clubs join in a body by subscribing to the requisite amount of stock, individual members are still advised to subscribe to the original shares independently of the club, for I am of the opinion that within a year the stock will all be subscribed for, and intending purchasers would be obliged to pay a premium to the original holders.

Now, there is one reason especially why every sportsman should send his name and 50 cents (being the 10 per cent. required by law to be deposited, when subscribing to one share of stock) to the undersigned, or to some sportsmen, who will attend the tournament, viz: The total capital stock of the company will be fixed at double the number of shares subscribed for before the end of the meeting at New Orleans (Feb. 17), the law requiring that 10 per cent. of one-half the capital stock must be paid in before the certificate of incorporation can be issued. Hence, the more subscribers there are before filing the papers, the larger the capital stock and the larger the number of sportsmen, who will eventually be holders of the original shares.

Before starting for New Orleans, every sportsman should canvas his acquaintances, and induce them to send their subscriptions per himself. Should this be received too late for sending subscriptions to New Orleans, send some to me at Cincinnati by March 1. Very respectfully,

J. E. BLOOM.

Our next issue will contain in full the draft of the constitution and by-laws of the association.

NEW ORLEANS TOURNAMENT.

THE second international clay-pigeon tournament will begin at the New Orleans Base Ball Park, Feb. 11, and continue to the 16th. The programme is as follows:

FIRST DAY—WEDNESDAY, FEB. 11.

Match No. 1.—Purse $200, individual sweepstake, 7 single C. P., 18yds.

No. 2.—Purse $200, the Von Lengerke individual sweepstake, 7 single C. P., the use of two barrels, break with second barrel to count ½, 21yds. Special prizes—To best score a patent folding centerboard (value $15), donated by Wm. Childs & Co., New York; donated by F. A. Allen, of Monmouth, Ill., to each of the four winners a nickle plated "duck caller."

No. 3.—The Merino Elastic Felt Gun Wad Match. All shells shall be loaded with the merino elastic felt gun wad; 5 single C. P. and two doubles. Special prize—A gold medal donated by the Merino Elastic Felt Gun Wad Company, of Baltimore, Md. The latter company also offers a special prize of $20 "to the shooters making the highest average score during the tournament who used our wads exclusively."

No. 4.—Purse $100, miss and out sweepstake, 18yds.

SECOND DAY—THURSDAY, FEB. 12.

No. 5.—International Team Championship Match. Purse $500. Club team shooting (3 to a team); 10 single clay-pigeons, 18yds.; 5 doubles, 15yds. Special prizes—To the best individual score made in this match, one Spencer repeating shotgun, value $100; to the winning team, one dozen decoy frames, donated by F. A. Allen.

No. 6.—Purse $200, individual sweepstake, 7 single C. P., 21yds.

No. 7.—Purse $300, open to any team of 2; 5 singles, 18yds.; 2 pair doubles, 15yds.

No. 8.—Purse $100, miss and out sweepstake, 21yds.

THIRD DAY—FRIDAY, FEB. 13.

No. 5 (Continued).—International Team Championship Match, 9 A. M. to 2 P. M.

No. 9.—Inter-State Twin Team Match, Purse, $300, open to any two (both being resident of same State), 5 singles 21yds rise, 2 doubles 18yds. rise. Special prizes—To the winning team, 1,000 Star paper shells, donated by the United States Cartridge Co., of Lowell, Mass.; to the second winning team, two nickel-plated duck-callers, donated by F. A. Allen, Monmouth, Ill.

No. 10.—Purse, $100, the Ligowsky Walking Match, Individual sweepstakes, 2 pair doubles.

No. 11.—Purse, $200, non-winners' sweepstakes, open to any who have not won in any previous programme match, 7 single C. P., 15yds. rise.

No. 12.—Purse, $100, miss and out sweepstake, 18yds. rise.

FOURTH DAY—SATURDAY, FEB. 14.

No. 13.—Inter-State Team Championship Match, purse, $500, open to club teams of 5, 7 singles 18yds. rise, 3 doubles 15yds. rise, class shooting. Special prizes—To the best individual score, one pottery pointer dog's head, donated by the Matt. Morgan Art Pottery Co. of Cincinnati, O.; to winning team five Nye creasers (2 nickel-plated No. 12, 2 nickel-plated No. 10, 1 copper finish No. 10), donated by the Nye Creaser Co. of Monmouth, Ill.

No. 15.—Purse, $250, non-winners' sweepstake, open to any who have not won in any previous matce, 5 singles, 18yds., 2 doubles, 15yds

Special Prizes—To the first winning score, one shell swage, donated by F. A. Allen; to the second best score, one copper-finish Nye Creaser No. 10, donated by the Nye Creaser Company, Monmouth, Ill.

No. 16.—Purse $100, miss and out sweepstake, 21yds. rise.

EXTRA DAY—FEB. 15.

No shooting in the morning. Extra sweepstakes will be called at 2 P. M. Capt. A. H. Bogardus, champion wing-shot of the world, will undertake at 3 P. M. to break 1,000 Ligowsky clay-pigeons within an hour, thrown from 5 traps.

No. 14.—Purse $250, individual sweepstake, 7 single C. P., 21yds. rise; use of two barrels, break with second barrel to count ½.

FIFTH DAY—MONDAY, FEB. 16.

No. 17.—Purse $200, individual sweepstake, 5 pair doubles, 18yds. rise.

No. 18.—International Individual Championship Match, purse $400, 10 single clay-pigeons 18yds. rise, 5 doubles 15yds. rise. Entrance purses to be divided 75, 15 and 10 per cent. First prize, the 75 per cent., $250 cash or the diamond championship badge (guaranteed by the Ligowsky Clay-Pigeon Company), won by C. M. Stark, of Exeter (N. H.) Club, at the First International Clay-Pigeon Tournament at Chicago, May, 1884. Should said badge be presented for redemption, $250 of the first prize will be appropriated for this purpose; if not presented, the Ligowsky Clay-Pigeon Company guarantees said first prize not to be less than $250 cash.

Special Prizes.—Donated by John P. Moores' Sons, of New York city, to the best score, a heavy Henry Richards single barrel gun, 10-gauge. To the second best score, donated by Julius Reis, of Cincinnati, Ohio, one setter dog (Effie—Brag). To the third best score, 1,000 Star paper shell (10 and 12-bore), donated by the United States Cartridge Company, of Lowell, Mass. To the fourth best score, one pair bow-facing oars, donated by F. A. Allen, Monmouth, Ill. To the fifth best score, a leather ammunition case, donated by J. F. Ives, Meriden, Conn.

No. 19.—Purse, $400; Von Lengerke team match; open to any team of two; 5 single clay-pigeons each, rise 21yds., use of two barrels, break with second barrel to count ½. Special Prize.—To winning team, two copper-finish Nye creasers, donated by the Nye Creaser Company, of Monmouth, Ill.

No. 20.—Purse, $250; non-winners' sweepstake; open to any one who has not won in any previous programme match; 7 singles, 15yds. rise.

NEW ENGLAND TRAP SHOOTERS.—It was a bad day for the marksmen at Walnut Hill on the 28th, yet there was a large attendance, and several exciting events were shot in the face of the heavy snow fall. The contest for the medal of the New England Trap Shooters' Association brought out wonderful shooting, considering the conditions. Mr. Dickey leading the procession. The score:

O R Dickey	01111111101111111111111111111111111111111111111101111	—45
H W Eager	01111101101111111111100101111111101101101111111111	—41
C Wilbur	10111011111111100111101111111101111101111011101111	—41

NEWPORT, R. I., Jan. 27.—Six members of the Miantonomi Gun Club, a newly organized club of this city, met last Wednesday for their second shoot. Quite a number of the members are good field shots, but the cold and high winds account for the poor score below. The contest was at 15 clay-pigeons, 21yds. rise, from two Ligowsky screened traps:

A Burkinshaw	010011010110011—8	Wm Rife	000000010110110—5
J H Congdon	000010001111011—7	J Brown	400110000000000—3
Wm Lynch	011010011000000—5	Geo Steele	001000000000000—1

BOSTON GUN CLUB.—There was a large attendance of glass ball smashers at the Boston Gun Club's ground Jan. 30, including a delegation from the Wakefield Sportsmen's Club. Several sweepstakes and a team match were shot. The conditions of all the matches were 18yds. rise, single birds, from one trap. The scores:

First event, 5 birds—F. C. Mitchell first, B. A. Ward second, I. T. Goodman third.

Second event—Ward first, Freeman second, Miles and Johnson third.

Third event—Mitchell first, Field second, Johnson and Miles third.

Fourth event—Field first, Goodman and Miles second, Rogers and Ward third.

Fifth event, 20 birds, three-men team match—Boston Gun Club first, Wakefield Sportsmen second.

After the team match had concluded, a number of minor matches were shot, in which Field, Ward, Kirkwood, Miles, Smart, Jacobs and and Allen took the majority of prizes.

TORONTO, Jan. 29.—The annual meeting of the Toronto Gun Club, for the election of officers and other important business came off at the gun club rooms, King street east, this evening, and officers chosen as follows: S. Donney, president, re-elected; T. Martin, vice-president, re-elected; G. Pearsall, treasurer, re-elected; W. Miller, secretary, re-elected. The following were elected as members of the executive committee: Dan. Black, J. Humphreys, R. Wilson, J. Tounson.

WELLINGTON, Jan. 31.—The usual Saturday afternoon shoot of the Malden Gun Club at Wellington to-day was largely attended. Sampson received the gold medal.

CARRIER PIGEON 427.—New York, Feb. 2.—*Editor Forest and Stream:* Inclosed find the leg of a pigeon which was shot during a pigeon match of the Algonquin Gun Club on Jan. 29, 1885. I was induced to send this limb to you by some of the members present, as perhaps some one has missed the bird, which may have been of the variety known as a carrier pigeon. The band found on the leg was stamped with the number 427.—MEMBER OF THE ALGONQUIN GUN CLUB.

NEPTUNE GUN CLUB.—Asbury Park, N. J.—The officers are: R. B. Cusack, President; J. L. Cliver, Vice-President; T. L. Emmons, Treasurer; W. H. Beegle, Secretary.

Yachting.

FIXTURES.

June 20—Hull Y. C., Pennant Matches.
July 11—Hull Y. C., Cruise.
July 18—Hull Y. C., Club Race.
July 25—Hull Y. C., Ladies' Day.
Aug. 1—Hull Y. C., Club Race.
Aug. 15—Hull Y. C., Open Race
Sept. 5—Hull Y. C., Champion Race,
Sept. 19—Hull Y. C., Champion Race.

THE CHALLENGE FOR THE CUP.

FROM the tenor of a private letter from an English yachtsman, we infer that the so-called "preliminary challenge" received by the New York Y. C. in December last, is considered by the senders as a formal challenge, and that they are awaiting an acceptance of it by the New York Y. C. No form of challenge is laid down in the Deed of Gift, the conditions being that "Any organized yacht club . . . shall always be entitled through one or more of its members, to the right of sailing a match for this cup. The challenging party shall give six months notice in writing, naming the day for the proposed race." These conditions have not been strictly complied with, the challenge received being sent by Mr. Beavor Webb in behalf of the owners of the Genesta and Galatea, with the notice that the official documents of clubs would soon follow. The New York Y. C. have considered Mr. Webb's letter as entirely informal and unofficial, and we believe, have taken no notice of it, awaiting a formal challenge from some yacht club or clubs, but it would seem that his letter was intended as a challenge, and is so considered by the owners of the yachts who are awaiting an acceptance of it. While the letter may not be technically a challedge, the Deed of Gift is not entirely clear as to the exact status of a member of a yacht club who desires to challenge, whether the challenge must come from the club through its secretary, or whether the member, with the consent of the club, may challenge personally, and in order to prevent future misunderstanding or complications, we call the attention of the New York Y. C. to the matter, as the owners of Genesta and Galatea evidently consider they have sent a bone fida challenge, and are awaiting a reply.

WINDWARD.

WE have already mentioned the boat building for Chicago, on the lines of the Windward, designed by Mr. W. P. Stephens last year, and illustrated in the FOREST AND STREAM of Feb. 7, Aug. 7 and Aug. 14, 1884, and also one building in New Haven, and now we learn of a third just laid down for a member of the Knickerbocker Y. C., of New York. The Windward has proved successful for the purpose for which she was designed, a cruising boat for one to three persons, her owner having used her about Newport all the season, sailing her alone for a great part of the time, besides taking his wife, at times, on short cruises. The rig has proved satisfactory for cruising purposes, as she handles well under full canvas, under mizzen and jib, and under mainsail only, having a little too much weather helm with the latter rig. We have received several inquiries as to the cost of such a boat. Built of oak and cedar, well fastened, with iron keel, cast ballast inside, and plain house and cockpit, yawl rig, 4 sails, of best make, wire standing rigging, running rigging and blocks complete, with cabin ceiled, about $600. With mahogany house and cockpit, pump, icebox, lockers and cabin fittings, $750. With fittings as above but lead keel and ballast, about $825. Thus for $600 to $900 a safe and comfortable boat can be had with really good accommodations for sleeping, cooking and living in comfort.

Those who intend to build from this design will find it an improvement to add to the weight outside, increasing the draft if desirable, if not the keel may be lengthened a little, and the rabbet line raised an inch or two, which can easily be done in laying down, giving a greater depth of iron with no more draft. At least a ton should be outside, and more, if possible, in which case the sail area may also be increased. If lead is used, nearly all may be on the keel. If the yawl rig is objected to, the mast may be stepped further aft, and the yacht rigged as a cutter, with one jib, or jib and staysail, as preferred. There is a place for just such little craft in all of our yacht clubs. Their cost may seem large compared with an 18ft. open boat, but they have nothing in common with such craft, and besides a part of this price is made up of ballast and fixtures, pumps, tanks, lockers, etc., which the open boat is without. Compared with a centerboard boat of similar room and ability, the difference of price disappears.

CLUB QUARTERS AND A POLICY.

Editor Forest and Stream:

I read the article in last FOREST AND STREAM in regard to the club of smallboat sailors and the floating club-house with much interest. I think it not only a feasible plan, but a very excellent one, especially the part relating to winter quarters and the opportunities of working out ideas by means of small models, drawings, lectures, etc. It seems to me that great impetus and an intelligent comprehension of the laws which govern boating can be given by a system which will bring together many persons interested in such matters.

Of course, nothing will take the place of actual experience afloat; but by learning of new methods of working, exchanging ideas of model, rig, etc., much can be done toward enlightening the growing community of small yachtsmen, and small yachtsmen, even more than owners of large craft, have need of a thorough knowledge of the profession; for, in the case of large boats, there is always a captain and trained crew, while a captain of a 3-tonner has often to "work ship" alone and trust entirely to his knowledge and pluck for his own safety and the safety of his craft.

I have made four cruises from New York to Hartford, through the Sound, in a 14ft. canoe, sailing all the way and through all weathers. So I think I have had all the knowledge and prudence I possessed to make the trips without accident of any kind.

This winter I am having built for me a keel sloop of about 4ft. draft, a boat shoal enough to enter any small harbor or river along the coast, and yet a heavy, staunch boat for seagoing. I was obliged to not exceed 4ft., as I shall use it for sailing along the coast and many places in Buzzard's Bay, which will not allow of more draft than that. I have read your articles on deep boats with much interest. I have had some experience in both types of boats, and find a deep boat much the abler, especially when large; but most of the cutters under 30ft. are not very comfortable boats, and not always fast. I think as the size decreases a wider boat is more roomy and more practical; not by any means the flat skimming dish, but a compromise between the two.

I think you are doing a good work in fighting the sandbaggers, as I am sure every step toward making a boat rely on good model and fixed ballast is a step in the right direction, at least toward making the sport safe. BRUSH.

NEW YORK CITY.

CRUISE OF THE MINX.

ABOUT the 1st of May it was decided by the writer to get a small yacht to meet the following conditions: First, it must be a boat for use on a river where at low tide water is a missing article, and on high tide is but about six or seven feet deep in a channel not more than fifty yards wide; second, she must be capable of making an outside cruise with a crew of two or three. These are rather difficult conditions to reconcile in a craft, but finally Messrs. Burgess Bros., of Boston, supplied our wants with a centerboard catboat of the following dimensions: Length over all 22½ft., waterline 20ft., beam extreme 9ft., draft aft 2ft. 6in. Cockpit small, most of room being taken up with the cabin; ballast lead and iron.

Aug. 5 at 5:30 P. M. Minx left moorings with a light breeze for a ten days' cruise along the Maine coast with a crew of two (F. and P.) aboard. Eight P. M. passed drawbridge at S. Newmarket, and with a freshening breeze were fast approaching P. C. R. R. bridge, when we gradually began to lose way, and finally brought up on mud flat, wind dead aft. It was so dark that it was impossible to see for any distance around the boat, sail was dropped, and P. doffed shoes and stockings and embarking in the tender got an anchor down in the supposed direction of the channel. Having eaten no supper, we next proceeded to rifle the contents of a ponderous "feed" basket, one of those for which New England mothers are proverbial. In about half an hour, during which time hard tack and doughnuts were thoroughly discussed, we floated, and with free sheet bore down upon the bridge. Of course the drawbridge keeper was away—they usually are—and it took at least three-quarters of an hour to get him down to the bridge and to open it. It is not surprising that he swore and growled at being routed out at such an unseasonable hour. Great and Little bays were crossed, and at 11 P. M. anchor was dropped for the night off Fox Point. P. dove for the starboard berth, by far the most comfortable, and unselfishly retained it for rest of cruise. Distance sailed fourteen miles.

Aug. 6. Turned out at 6:30. Made coffee on stove, and after eating a frugal meal, weighed anchor and continued down the river. The drawbridge at Dover Point was open for a freight sloop so we rushed through with all sail set. Portsmouth, twenty four miles from Exeter, was reached at 11, though a strong tide against us made it slow sailing. We left tender here. I went ashore and returned with six bottles ginger ale, the strongest liquor allowed. A reporter for the *Times* was down on the wharf, and after filling him with yachting news—not with ale—we pushed out from the wharf with a light wind from N.W. and a favorable tide. We soon passed the navy yard, which looked rather deserted after its dissipation of two days before (the receptiong of Greely expedition).

The swirls in the current off Pull and be D—d Point made good steering impossible, and it is not surprising that the English officer named the point as above. We had seen the current at the mouth of the Merrimac and that through Hell Gate, but have yet to see one swifter than the current at this part of the Piscataqua. While drifting by the never to be finished Fort Constitution, dinner was served; I eating the whole of a very sizable chocolate pie, and P. being content with a bowl of jelly. Giving Whaleback Light and the adjacent ledges a wide berth, we jibed over to starboard, and with a four-knot breeze on our quarter, we laid a course for Cape Neddock Knubble.

What a relief ocean sailing is after poking about a muddy river for months, and we had stolen upon one of the most picturesque parts of our coast. Isles of Shoals, Rye Beach, Little and Great Boar's Heads, Boon Island and the Knubble, all in sight. "Isn't it beautiful?" "Grand!" "Perfect!" Grand!" "Can you imagine anything better?" "Hard up with helm!" and we jibed over to port just in season to avoid a ledge which suddenly appeared in the water below us, careless navigators. Up to this time charts had not been consulted, but luckily no harm was done. A fishing schooner of about sixty tons passed us, and we hailed it. "Wind hold steady?" "No, probably haul into suth'ard 'fore night." 5 o'clock, off Knubble, rolling horribly. Mast began to jump a little. Crew went below to secure it; came out looking a little white about mouth. A light wind off shore gave us the wherewithal to reach Moses French's in season to get supper. Anchored in Cape Neddock River, and turned in at 8. Mean harbor.

Aug. 7. The worst day of the cruise, not a breath of wind all day, and loafed about the cockpit until about 10, when we saw two ten-year-olds fishing about thirty rods away, and hailed them. "Will you come out and take us ashore?" No response; they failed even to look up. "Give you a quarter." They were alongside within two minutes,

and in another two minutes we were on dry land. Fed at Moses French's, whose fare we cannot too highly recommend, at 1 P. M. and again at 6 P. M. At 7 went aboard the Minx again. One of the ten-year olds, with visions of another quarter in his brain, had been waiting ever since we left him, ready to set us again on our yacht. The swell from the southeast was horrible. Before turning in a few trite remarks were exchanged regarding the relative whiteness of our respective gills. By 8:30 all were asleep. Distance covered for the day, seven feet, taken up on cable.

Between Aug. 7 and 8, exact time impossible to determine, the occupant of the starboard berth was aroused by a commotion on deck in the dark. "Con-f-f-f-ound—we will call it confound for sake of euphony—this—communication cut off for an instant—s-s-s-swell, plunk, plunk, plunk."

Aug. 8. On deck at 7. Another calm. We hailed a man in a schooner at anchor near by. "Have any wind, think?" "Yes, guess so; blow from southward by noon." At about 9 a little breeze came up from eastward and with it came up also our spirits In fact, the "grand" was almost on F.'s lips. We immediately got under way and sped along the coast at the alarming rate of three miles an hour. Passed Baldhead Cliff, Wells' Beach, Kennybunk Reef and Cape Porpoise. After passing the latter point the wind rather increased, and very good time was made to the mouth of the Saco. With chart in hand we picked our way through the puzzling channel in the rear of Wood Island, and with a strong breeze rushed by Biddeford Pool and headed up the river. At one place the channel makes very near the bank. While passing this point we were assailed with a shower of green apples from the hands of the infant natives. P., who is exceedingly fond of such feed, ate all that came into the boat.

The banks of the Saco on either side are lined with old wharves and enormous warehouses rotting away, the only vestiges left of the glory of those days when the Saco controlled a large part of the trade to the East Indies. Of the natural appearance of the Saco all one can say is that it partakes the characteristics of a mountain stream rather than of a tidal river; the banks being high, heavily wooded and exceedingly picturesque. When within about a mile of the city of Saco, our anchor was dropped (7:30) for the night. A high bluff, at least forty feet above the river, offered a desirable camping place, and that night for the first and only time during the trip the crew slumbered in open air. Sitting around the camp-fire the time was profitably and pleasantly passed until midnight, at about which time we fell asleep.

Aug. 9. At 5 A. M. we arose, and hastily embarking, dropped down the river with a favorable tide. At the mouth of the river we found a fresh breeze from N. E., or dead against us, so we hauled the sheet aft and made a board of about six miles out to sea. The wind was strong enough to keep the rail well down to the water, with enough sea on to occasionally drop a little spray into the standing room. We passed Old Orchard, Punt's Neck, and Richmond's Island, and discovered White Mountains in full sight looming up seventy miles away. At 1 P. M. we passed the whistling buoy off Cape Elizabeth, and at 2 were plowing up Portland Harbor with the wind free on port quarter. On our way up we met a sloop and a catboat, each of about our size, and we put about to have a brush with them. It was nip and tuck on the beat down, but we worsted them, however, on the run up to the city. At 7 we anchored in the channel between Diamond Island and Fort Georges. While here we made rather a questionable barter. We discovered that we were all closed in a line of lobster pots, and fresh provisions scarce. We raised a pot, extracted a lobster, and replaced it with a quarter. Boiled the lobster in coffee pot (had to tie him to make him go in), and ate the best supper of the cruise.

Aug. 10, Sunday. Spent the day on Diamond Island and visited several parties which were camping out. Calm all day.

Aug. 11. Another calm. Not a breath of wind from sunrise to sunset. 9 A. M. Towed Minx to one of the lumber wharves to replenish, if possible, our stock of wood. We saw a pile of refuse chips, which we received permission to assail, evidently, however, from one not having authority, for the stevedore chased us off the wharf. Nevertheless we clung to the wood. In the retreat P. ran against a hook which protruded from the corner of a shed, an operation which cost him the better part of his trousers, and F. left the hatchet behind, so on the whole we were rather worsted. We cruised over to the next wharf when P. landed and went up into the city with the same trousers on. In half an hour he returned with a peck basket full of peaches. These, with the exception of one or two bricks, were demolished before supper. (Fact.) Anchored in same place as in the two preceding nights. No lobsters trouoled.

Aug. 12. Weighed anchor for home with a light breeze from the west. While passing one of the islands, close hauled, a freight sloop appeared bearing down upon us about two hundred yards ahead. Being rather cramped for room we decided to hold our course and sung out for the skipper to put his helm to port and give us a little more room. Instead of doing that he luffed a little, crowding us all the more. To avoid a collision we were compelled to run up into the wind in water not more than five feet deep. As the sloop passed us the skipper wore a sardonic grin on his ugly visage, which irritated us, to say the least. Words flew, and retlew, then flew again. These, however, were not powerful enough. P. seized a harpoon, all that was left of the deck of the day before, which by a good shot took the skipper between wind and water. Our happiness at the moment fully compensated for the inconvenience of having to luff. The skipper's expression was doubly sardonic but lacked the grin. Seriously, it is time that some of these lubberly skippers should learn the rules of the road, and having learned them act accordingly. Of course in meeting a large craft it would be too presuming to always hold your course in a small boat, though you have the right of way, but there are times when it is proper to maintain your rights.

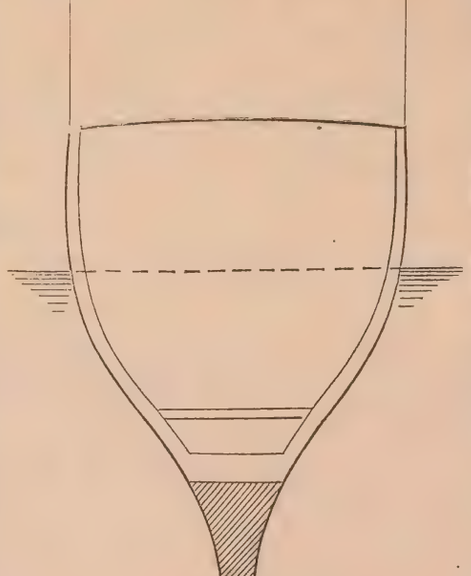
After reaching Portland Headlight (9 A. M.) the wind dropped, and there was another calm which lasted through the day. Though sail was kept up till 7 P. M., we covered only the distance to Cape Elizabeth lights, when making everything snug, we carelessly pitched anchors overboard in open water about half a mile off the Cape, ledges all around us, and turning in, slept the sleep of the just.

Aug. 13. The crew turned out at 6:30, awakened by the boom breaking adrift. It was blowing fresh from N. E., accompanied with rain and a heavy sea on, and the boat tumbling about in lively order. Anchors, however, had not dragged, though the cables would strain at every sea that struck us. After some sparring and grumbling, it devolved upon us to get anchors aboard. Sail was soon made, and with strong wind dead aft, sped down the coast boom to port. Passed Ward Island keeping well out. Wind fast increasing in strength and sea fast getting up. Concluded to run for Cape Porpoise, and there make a harbor. Topped boom up at an angle with cockpit floor of not less than 35 degrees. Even then it would sometimes touch the water, and again would almost coincide, so to speak, with top of the mast. Off Goat Island, at mouth of Cape Porpoise Harbor, the sea was tremendous for a boat the size of the Minx, and we were only too glad to haul on our wind and run for the harbor. As we ran up the narrow channel, kept each of sail just full, rest of sail flapping. Even then the boat was almost on her beam ends. We found the harbor almost full of craft of everywhere from 15 to 70 tons, which had come in for shelter. Dropping our anchors in a good place and making everything snug, we went below and soon had a good fire going and clothes drying. The run just made was a more exciting one than I ever care to make again. We had left Cape Elizabeth at 5:45, and were in Cape Porpoise Harbor at just 8; 18 miles in 2¼ hours, and the last half of the run much quicker than the first half.

We had been carrying full sail in a breeze where a close-reefed sail would have been more than enough.

Right here, fro h from the perils of the deep, I would like to put in my oar, feeble though it be, in favor of narrow beam, deep draft, flush deck, and the cutter or the yawl rig. Never was the disadvantage and mischief of light draft and a long boom in heavy weather more forcibly brought to my mind than in the run just made. Had our craft been a yawl or cutter, with outside ballast, we should have pushed right through for Portsmouth, and thought nothing about it. With a light draft, beamy boat one can have no comfort nor sense of security in heavy weather. A capsize may be imminent, caused either by running the boom under water when rolling heavily or by the direct pressure of the wind on the sails. And yet, up to within a few years, this was the only type of a vessel that we on this side of the Atlantic possessed! Thank heaven for the revolution in yacht modelling caused by the success of the Madge a few seasons ago. I have done most of my sailing on boats of the beamy class only to find them lacking in those requisites which go to make up the perfect cruiser, and I would much rather circumnavigate the globe in a 50ft. cutter than a 70ft. American sloop.

With fire burning briskly, coffee was made and time was spent watching the breakers strike the ledges off Goat Island and "ain't you glad ing" each other that we were not out there. At about 4 P. M. we heard the sound of oars, and going on deck found three beautiful and certainly enterprising young ladies alongside in a row-boat. They had rowed out from the wharf to get the name of our boat. They said they had the name of every yacht that had entered the harbor that season. Should have asked them aboard had it not been for the dilapidated state of P.'s trousers. While rowing back to the wharf they favored us with a few trios and duets which sounded delightfully, as mingled with the whistling of the wind, the notes reached our ears. At 7 o'clock we had supper. What truck a person can eat with impunity when in the open air. We had a large can full of raw clams, tougher than "biled owls." These we threw into the spider with almost half a pound of pork, and in ten minutes took the mixture off "fried." Great heavens! We disposed of the whole of that compound, went to sleep and woke up alive. One such meal as that eaten during one's regular life on shore would provoke an incurable dyspepsia.



Aug. 14. The wind had hauled into the westward, and though the sea was still heavy we got under way at 8, and in a short time reached Moses French's at Cape Neddock, and once more enjoyed his fare. In the afternoon the wind was still light, but we reached Portsmouth at 5 P. M., and after tying up to the wharf, went up into the city and got another peck of peaches, which we almost finished before turning in.

Aug. 15. Adverse tides, light winds and delay at the drawbridges made us late in reaching Exeter, our moorings being reached at 9 P. M.

W. P. Chadwick.

THE BUOYANCY OF CUTTERS.

In a late number of that excellent French publication, *Le Yacht*, is a sketch of a modern narrow beam 5-ton racing cutter called Tjemla, ex Jenny. She was built at Barrow, Scotland, and is 33.5ft. loadline by 6ft. beam, that is five and a half beams to length, certainly very extreme proportions, seldom exceeded even under the beam-squeezing Y. R. A. rule, and not at all likely to be exceeded under the new sail and length rule it is proposed to substitute. As figures convey an idea less readily than the pictorial representation, I have herewith reproduced the Tjemla's midship section to scale.

It has been continuously urged by persons not conversant with the matter that such narrow boats must lack in buoyancy, and are in constant danger of being engulfed by a sea, and also make their passages under water. One glance at this section is enough to convince any one of the utter absurdity of such notions, for it can easily be estimated that the Tjemla is possessed of ample buoyancy and to spare. In approximate figures her displacement is 33 5×6×5.75×0 32 d vided by 35=10.57 long tons. And her above-water bulk is equal to her length × freeboard × beam × 0.7 + counter, or 33.5×2.5×6×0.7 =351.75=10.05 long tons. This narrow cutter has therefore just about as much above-water bulk as immersed body, or a total equal to twice her displacement. To submerge the yacht to plankSheer would require a weight of water on deck amounting to over ten tons. To fulfil this condition the deck would have to be loaded clear fore and aft, and the whole width of the boat with a sea approximately 2ft. 3in. high, as I have shown by the rules above deck in the section. Now, the impossibility of ever meeting such requirement in practice is too self-evident to need further argument. Owing to the heeling and pitching of the vessel it is safe to say not one-quarter the weight of water could ever find lodgment at one time upon the Tjemla's deck. She has raced in hard weather often enough, and cruised from Barrow to Nantes in France without any trouble. The man who would say Tjemla could not face a sea without danger of submersion would be simply laughed over the side by those who are acquainted with the boat. She will rise more readily to a sea, clear herself of water quicker, throw no spray and be a drier and more comfortable boat than any wide sloop can ever hope to be. I would not hesitate to cruise the world round in just such a boat, and consider her so much superior for coast cruising to a 35ft. New York centerboard trap that comparison becomes positively ridiculous.

C. P. Kunhardt.

REVISING THE YACHT LIST.—Yachtsmen complain every year that the reports of their yachts in the list are not correct, but very few ever take the trouble to remedy the error in the following volume. In compiling such a book as "Olsen's," the main sources of information, the various club lists and similar reports, are often inaccurate, besides which changes are made every year. In order to make the list as complete as it should be, the co-operation of owners is necessary, and we call the attention of all to the fact that Mr. Olsen is now at work on a new edition of his book for 1885, and will be glad to receive notices of errors in previous editions, and of subsequent changes, as well as of new yachts. Mr. Olsen has done a good work for yachtsmen in publishing his annual list, and it rests with them to aid him in improving it each year. With every copy is sent out a blank to be filled out, but those who have not the book can at least send the name, dimensions, name of builder, date of building, and other particulars to Mr. Neils Olsen, New York Yacht Club House, 67 Madison avenue, New York.

OPINION IN FRANCE.—*Le Yacht* of Jan. 17 has the following, written by L. More, a well-known and sensible critic: "Now, if we reflect that the best of the single-stickers in America, the Bedouin, built on the plans of the celebrated English constructor, Harvey, now resident in America, is after all only a good cruiser and not a racer to be compared with the modern English cutters, which represent the most powerful expression of racing vessels, it is really difficult to understand a determination on the part of the Americans to race with a sloop, which is equivalent to a fight without any hope. Only one explanation seems possible. It is this. The Americans, understanding their condition of inferiority in which they are at present concerning the building and maintenance of a cutter, think they stand a better chance with the sloop, which has so long been their favorite boat, but at the same time with a sloop made after new ideas, such as their spirit of enterprise and invention may suggest."

DEPTH AND WEIGHT IN ROUGH WATER.—In the "Cruise of the Minx," published elsewhere, the writer adds his testimony to that of many others as to the evils of beam, light draft and sloop rig in rough water. His remarks carry additional weight, as they come, not from a cutter advocate, but from one whose experience has been largely in beamy boats, and th y are brought forth on the spot after a practical test of the disadvantages of the shoal craft before the wind in a little sea. We call the attention of all to Mr Chadwick's remarks, as under the circumstances must be more convincing than any argument, however powerful, advanced in the course of controversy on shore.

UNA.—Among the many proposed defenders of the America's Cup which are springing up in all directions is the old Una, built by Geo. Steers, in 1847, as a centerboard boat, and afterward lengthened by him. Her dimensions at present are: Length over all, 71ft. 9in; waterline, 68ft.; beam, 17ft. 8in.; draft, 7ft. 6in.; Custom House tonnage, 48 98-100. She has sailed for some years as a keel boat, her centerboard being removed. Her ballast consists or 25 or 30 tons of pig iron, stowed inside. We have received from Mr. F. L. Downing, of Concord, N. H., two photos of the Una as rigged at present, as a schooner.

"THE MODEL YACHTSMAN AND CANOEING GAZETTE."—We have received the first volume of this little paper, and can commend it to all who are interested in building and sailing model yachts. Besides a record of the various meetings and races of the clubs, and articles on yacht construction, each number contains the working drawings of a model yacht, sailing or steam. With the present year the subject of canoeing will be added, the paper being enlarged. The subscription price is 3s. 6d. per year, which may be sent in stamps or postal order, to Thos. Grassom, Hull, England.

KEELBOATS ON LAKE ERIE.—The newly formed club at Detroit, the Michigan Y. C., has the right material for the future success of the organization. An extract from a letter from one of its members will be of interest to our readers: "Deep keels seem to be coming into favor here. About a year ago I took it upon myself to introduce them in our waters by building the Jennie J., a little compromise, 33ft. on deck, 29ft. on waterline, 9½ft. beam and 4¼ft. draft. She had an iron keel weighing 6,500 pounds, and had 1,000 pounds inside ballast. She was considered an experiment by every one. We had a series of races, one every two weeks throughout the season, for yachts of 25 to 35ft. waterline, for a champion pennant, and the 'innovation' lost the championship by just one race. The cause of her losing the prize was that she was never sailed twice by the same crew, and her canvas was all old, taken from another yacht, and a piece 4ft. wide was added to the leach of the mainsail."—*Boston Herald.*

MORE LEAD OUTSIDE.—The little keel yacht Gil Blas is having lead removed from inside and floor lowered, which will give 5ft. headroom in cabin. The lead will be cast on the keel, making 4,500 pounds in place of 3,000. The Gil Blas is now enrolled in the Knickerbocker Y. C.

WINNING YACHTS OF 1884—WITCH AND CARMELITA.—The owner of the Witch writes us that the races reported on Sept. 7 were incorrect, as the boats have not raced this season.

CRUISER.—Three new boats are now being built in Boston from the lines of the Cruiser, lately given in the Forest and Stream, and will race together next season.

AMATEUR BOATBUILDING IN GERMANY.—The *Wassersport* has commenced in the last number a series of illustrated articles on boatbuilding.

MAGGIE.—The captain of the Maggie, Henry Randall, has sailed for England to superintend the fitting up of Mr. Warren's new cutter.

AMY.—The steam yacht Amy, E. D. Morgan, arrived at Singapore on Friday last.

Canoeing.

FIXTURES.

July 24 to Aug. 8—A. C. A. Meet, Grindstone Island.

THE CANOE MEETS OF 1885.

Although four months still intervene before the meet of the season, it is time now to settle on dates and localities for the different events, in order to prevent any interference with each other, and also to give time for the many needed preparations. First in importance, of course, comes the Association meet at Grindstone Island, beginning on July 24 and terminating on August 8, an earlier date than in previous years, but it is anticipated that there will be more wind than later in August. This meet is sure to attract the majority of canoeists between Pittsburgh on the west, and Boston on the east, as well as those from Canada. Last year the attendance was very satisfactory, all the prominent club being represented, but there are still some clubs, as well as several localities where no clubs are yet formed, that were not represented.

It is to the advantage of every club in the country, no matter how small or how far distant, to have one representative at the annual meet, and we hope this year to see a member from every club at Grindstone.

The Association is working hard to extend canoeing and to advance it in every way, and though they may not admit it, it has benefitted every canoeist in America directly and greatly. By organizing and working together the members of the Association have increased greatly the number of canoeists, have obtained a recognition of them that has done away with the many unpleasant features of early canoeing, when every traveler in the unknown craft was the butt for ridicule, impertinence, and even personal abuse, and have obtained many rights for them with railroads and steamers. They have created a literature of canoeing, have stimulated the improvement of canoes, and have established a system of collecting and exchanging information from which all, even the isolated canoeist in the most distant localities, derive a substantial benefit. Now in return it rests with these clubs and canoeists to assist the Association as far as they can, by joining it, and on the part of the clubs, by sending a representative to the yearly meet. The expense is but small, but where no one member can afford it, it would be a legitimate and proper use of the club funds to pay all or a part of the expenses of a delegate, for which purpose a good canoeist and careful observer should be selected to attend the meet, to act for the club on committees and in the caucuses of the Association, to make the acquaintance of other canoeists, to take thorough notes of boats, sails, rigging, outfit, races, and the many novelties seen at each meet, and to make a full report of the same to the club on his return. This experiment tried but once would change the club from an isolated body working alone, and greatly behind in practical knowledge, to an active member of a large and important organization, with full sympathy for the work, and a knowledge of all that is new in canoeing. In many cases the accidental presence of one man, sometimes not even a canoeist, at a meet, has resulted in the formation of a prosperous club.

The same facts are true in regard to localities where there are several canoeists, but no organization. A visit to a meet by one of them starts the matter, and soon canoeing is firmly established there. This year the meet promises to surpass those of all previous years, and every canoe club should take measures in time to have one member at least present, and if possible to have more.

There has lately arisen a spirit of competition among the larger clubs as to which should make the best showing at the meets in point of numbers, boats, rigs, uniforms and racing record; that is already showing good results in new boats and greater attention to sailing and paddling, and those clubs which expect to be among the first this season must begin work soon. Now is the time for improvements in boats and rigs, and discussions on points of sailing, and soon will be the time for practice afloat, and early preparation is the main element of success in such work.

This year promises to inaugurate a new era in American canoeing with the first meet in Western waters. Hitherto, although there are many detached canoeists, as well as clubs, in the West, they have taken but little interest in the Association, and there have been but few members west of Pittsburgh. One of the clubs most prominent in the early meets, the Cincinnati C. C., an organization once widely known from their skill in sailing and the excellence of their fleet, has entirely disappeared from canoeing, and no other has taken their place as a representative of the West, which last year was entirely absent from the meet. The Cleveland C. C., under the active leadership of Commodore Gardner, has started a movement for a meet in July, naming one of the Bass Islands as the site for a camp These islands are situated in Lake Erie, about sixty miles west of Cleveland, and about as far east from Detroit, Toledo being some forty miles distant. They can be easily reached by rail and steamer from Michigan and Wisconsin, Chicago, Cincinnati, Cleveland, Toledo, Sandusky, Detroit, and all points in the West, and are nearly central for a large range of territory, including Canada. From them the canoeist can proceed by steamer direct to Clayton, but five miles from Grindstone Island. This meet will be under the auspices of the Association, and will bring the latter to the immediate vicinity of Western canoemen, removing the objections they have urged against joining, and it rests with them to make it a success and a permanent fixture.

It is intended at this meet to form a Western Branch of the Association on an equal footing with the Eastern or, at present, main division, under common government and rules, each with its annual meet and local officers, but under one commodore. Such a movement is of direct interest to every canoeist in the West, as it brings to each the advantages of co-operation and benefits that he could never obtain unaided. Now is the time to come forward to the aid of those engaged in the enterprise, and to lend all the help possible.

First, each canoeist should join the Association, sending his name, with $2 for initiation and dues for one year, to Dr. C. A. Neidé, New Orleans, La. Next, canoeists can unite together in each town or city, and even if no club be formed, can aid each other in transportation facilities; which are usually granted to members of the A. C. A. more readily than to individuals. The clubs in the larger cities should at once come to the aid of the Cleveland C. C., as much can be done in each locality.

In such cities as Chicago, Minneapolis and Cleveland, where large canoe clubs are found, much can be done to secure an attendance from the surrounding country by correspondence with isolated canoeists, and by arrangements for transportation. There will be nothing local about the Western meet, but it is desired to enlist canoeists of all shades of opinion and from all parts of the West, in a union that will be congenial to all, and to this end we invite correspondence with suggestions and discussion, from boating men in all parts of the country. It must be understood that this meet is not confined to members of the A. C. A., or even to canoeists, but that boating men, campers out and yachtsmen will have a hearty welcome, and a chance

to see what canoeing really is. It is desirable, as soon as possible, to know about how many to expect, so those who intend to be present are invited to send their names to FOREST AND STREAM.

Several plans have been proposed for the organization of the Western Branch, but nothing definite has yet been decided on. The subject is still open for discussion, as some time will elapse before any action is taken.

Besides these two Association meets are the local camps, of which several were held last year with great success. This year others will also be held, the largest being that on the Hudson. The date of this camp will be May 30 an l 31, and the site proposed is that of last year's camp at Plum Point below Newburgh. The Newburgh canoeists have extended a hearty welcome to all to meet again there, and have secured the same ground from Mr. Verplanck. They will lay out a new course above the old one, and expect to be able to make better arrangements for landing and launching than those of last year. The sentiment of canoeists generally, we believe, is in favor of returning to this point; but the Rondout C. C. are anxious to have the meet there instead of below, and a good site and sandy beach can be had at Esopus Island, but the sailing course would be poorer than at Newburgh.

We suggest that Commodore Oliver's idea of a cruise be adopted, a rendezvous being made at Rondout by all who can spare the time on Thursday night, camping at Esopus Island, and continuing to Newburgh next day, arriving Friday night, which could easily be done. The decision as to a site should be made immediately, so as to give either club time for all preparations, and we invite opinions on the subject from canoeists who will attend, in favor of a camp at Rondout or Newburgh, as it is desired to accommodate the majority. The matter is one that is outside of the Association, and those interested must settle it themselves. Wherever the camp may be, a full attendance of canoeists is expected, and clubs at a distance are invited to send at least one member. Springfield, Hartford, and other places that have their local meets, can send one delegate to the Hudson, and perhaps a man from Albany and one from New York will find his way to the Connecticut or Merrimac.

We have heard nothing yet from Springfield and Hartford, but we know they will have a jolly gathering early in the season, as they fully appreciate the value of such meetings. Lowell reports in a letter this week, to which we call the attention of all Eastern canoeists.

The growth of canoe clubs has been rather slow until the past year east of the Connecticut, and the attendance at the first meet, on the Merrimac, was smaller than it should have been; but now there are a number of clubs and canoeists, and this year they should turn out in full force. The matter should not be left entirely to the Lowell men, as many of their club are not canoeists; but we suggest that the various clubs about Boston take the matter in hand at once, calling a meeting and discussing the question, and then corresponding with the Vesper and other clubs. Lake George, Toronto, Peterboro, Rochester and other localities will, no doubt, have similar camps in May and June, though nothing has as yet been done.

These local meets serve a purpose that is attained by no other end; as, being smaller than the annual meet, the men become better acquainted, and they attract many outsiders and give a great impetus to canoeing over a large range of territory, and this feature should be kept prominently in view, in organizing them, to bring in as many outsiders and novices as possible, to give them a chance in the races, and to create a favorable opinion of canoes and canoeists wherever held. Under the present conditions the management of local meets is in no way an Association matter, and there is no one to whom the government be ongs, but it must be done by some club or individuals, as at Newburgh, who are willing to take a great deal of trouble on themselves. The labors of these gentlemen, to whom so much is always due, may be greatly lightened by timely aid and co-operation of all canoeists, and now is the time when it will be most valuable in arranging the preliminary details.

A CRUISE DOWN THE ST. JOSEPH RIVER.

JUNE 9, 1884. Rail to Mendon, Mich. Launched the canoe at 1:45 P. M.; weather cloudy, windy and threatening rain; river appears to be very rapid and shallow; one mile out, severe rainstorm came upon us; anchored under overhanging boughs; intending to remain until cessation of rain, but at 3 o'clock it rained still harder and my wife becom ng somewhat chilled, we determined to move on until a more desirable camping spot was reached. The wind blew a canoe gale; the rain poured down without any respect for our feelings; the river was rapid and foamy, with head wind and waves; a very mad and dangerous looking rapid was reached and passed by hard work by myself and good management of the tiller ropes by my wife. During the struggle here, and just as we were about over the rapid, the rudder was accidentally unshipped, which made the matter of a safe landing in the current a little risky. It was, however, accomplished without any harm, excepting some hard knocks received by the canoe striking some partially hidden boulders. At 4 o'clock camp was all snug in the dooryard of Mr. Lewis Downing and his estimable wife. At this time the rain had slackened some, but the wind had increased its force and the air changed, becoming uncomfortably cold. The canoe cook soon had the first camp meal ready, and the tired crew dispatched it with alacrity and relish, and the only smoker in camp enjoyed his inevitable pipe and tobacco. The wind, rain and cold increasing; at 10 o'clock we accepted the hearty and earnest invitation of Mr. and Mrs. D. to camp inside of their house for the night, and we enjoyed a sweet, refreshing sleep after the hardest and shortest cruise of our experience.

June 10. The weather still unsettled, cold and disagreeable, we decided to remain in camp for the day near the "radish and strawberry patch" Rode to Mendon with Mr. D., and from many questions put to people about the river, its habits, form, shape, etc., we anticipate and conclude as follows: That the river is or is not rapid; that it does or does not increase in rapidity; that there are or are not many shallow riffles, rapids, rocks and snags; that the river will be 100ft. deep or we will be paddling on dry land before our journey ends; that it will take us six days or six months to reach the harbor; that the dams are easy or hard to get over; that the river is or is not crooked or winding; that it is less than 1,000 miles to the end of the river, and lastly, that we will depend entirely upon our personal experience as we move along to learn about it. One thing has been discovered in an hour's paddle, that the river is a very rapid one, stone and gravel bottom, and indicat s so many riffles as to warrant in calling it shallow; however, everything points to a delightful cruise. At this writing we have a beautiful sunset.

June 11. The cruise begins in earnest. Left Downing's at 7:45 A. M. Weather still cloudy. River rapid, stony and shallow. In the first five miles six dangerous looking rapids filled with boulders were passed, although several times the keel settled upon rocks, but was soon released with the aid of the boat hook and swift current. Went into camp for an hour and a half for dinner and rest. Reached Three Rivers at 1 o'clock; had canoe portaged around dam to Lockport, one mile distant; arrived at Constantine at 5:30 o'clock pretty well used up from the hard day's work, sunburned to perfection. Saw some G. A. R. badges worn by strangers standing on the corners; we approached, made ourselves known as comrades from Sion S. Bass Post No. 40, Department of Indiana, the largest in the State. In a short time we were friends; they kindly took charge of the Idlewild and housed it for the night. The weather has been intensely hot today. The river is a continuous twist, and deceiving as to distance. It is filled with beautiful islands, and remarkably free from obstructions except shallow, stony spots.

June 12 Pulled out of Constantine at 8:40; passed Mottville at 10:30. At 11:30 went into camp for dinner and rest from intense heat. Started again at 2 o'clock, passing Bristol at 2:30. Here we experienced our first severe work in making a portage, and the only one in which my wife had to assist. No one being in sight that could render a sistance, the "tug of war" was begun, the carry being a long one, occupying an hour. Arrived at Elkhart at 7:10, feeling splendid and in good spirits. Here we expected to experience some difficulty in getting the canoe housed, but were happily disappointed, for we met a gentleman, Mr. C. L. Dean, who courteously gave us the use of his fine boat house, and rendered other valuable assistance not soon to be forgotten. Disappointment, however, came in finding the telegraph and post office closed, and the telephone service imperfect. We re onciled ourselves to the situation, feeling positive that morning would bring us good news from home, but again we were disappointed. Another effort made at the telephone proved more satisfactory, but an answer to telegram failed to reach us before our departure. The cruise of yesterday was exceedingly delightful, excepting about two hours of intense heat. The river from Constantine to Elkhart is broad, clear, winding, rapid and free from obstruction, excepting some half dozen swift, shallow riffles, several of which neces itated wading. The scenery is beautiful, and being less tired, sore and sunburned, the cruise was more enjoyed. Paddled about thirty-one miles.

June 13. Weather very cool. Left Elkhart at 10 A. M. Dinner at 1. Left camp 3:10, passed Mishawaka at 4, arriving at South Bend at 5. Mr. Adams, superintendent of the water works, kindly stored the Idlewild in the pumping house, his men freely doing the carrying for us. The cruise to-day has been most delightful; cool, strong stern wind, rapid, clear, deep and winding river, and scenery lovely. Paddled about twenty-three miles.

June 14. Paddled away from South Bend at 9:50. About half a mile out, in crossing a riffle, broke the rudder pin, which caused half an hour's delay to repair. Stopped at 12 for dinner; started again at 1:10. A strong head wind to-day made paddling laborious. Getting in sight of Niles, wind and waves very high and increasing in strength and height as we neared the dam; my wife, feeling rather nervous, insisted on getting out and walking. She lost her way in the woods, and when she was shown her course by some ladies that she met she reached the canoe pretty well used up with fright. Reached Niles at 3:10. Cruise delightful; river clear, winding, deep, slackened current and free from obstructions, excepting one riffle near South Bend. Paddled about twenty-one miles.

June 15. Spent Sunday in Niles resting, for we anticipated a two days' cruise to Benton Harbor.

June 16. Many friends met us at the river to see the little boat and its load start, which it did at 8:10; passed Buchanan at 8:50, and Berrien Springs at 12:20. Laid off one and a half hours for dinner and rest. Reached Benton Harbor at 7 tired and worn, the heat being almost unbearable, the water over half the time at almost a standstill, and the distance made entirely by paddle, 50 miles accurate. We had been led to believe that this portion of our cruise would be easy; that we would find here the most rapid and steady current on the river, deep and no riffles or shallow places. On the contrary, we found very little current a number of shallow spots and riffles, and more snags and dead timber than on any portion of the river we had traveled. The river is a succession of short curves and twists In a single mile we had paddled east, west, north and south. We admired most that portion of the river from Constantine to Elkhart. There are many beautiful spots all along the river; it is a delightful cruising ground to be gone over with leisure, say an average of 20 miles per day. The Idlewild was much admired by many, and while built for but one, did her work nobly for two, receiving many hard knocks. She carried 150 pounds of baggage and two passengers. She is a "Racine Shadow," 14ft. long, 28in. wide and weighs 95 pounds. My wife did bravely, enjoying the cruise hugely, and is ready for another, notwithstanding she has great fear of water, snags, riffles, rapids, etc. We were five days on the cruise, making at the lowest fair estimate 165 miles. WILLIS D. MAIER.

THE EASTERN MEET.

Editor Forest and Stream:

"Senorita," of West Somerville, Mass., is disappointed in the amount of canoeing matter which he finds in the FOREST AND STREAM. That is quite natural, and would probably be the case if the whole paper was devoted to the sport, for who ever got enough of canoeing?

My canoe has been idle most of the time since last September, when I had it at Ipswich Neck, and used it in shooting ducks in Ipswich Bay. She is 18ft.x36in., open. A friend and myself used her in all sorts of weather and water, he sitting a little forward of amidships and I in the stern. He used a 9ft. double paddle and I a single, and the way we made her skip was a caution to the natives. We had an audience of a whole schooner's crew one day, as we put her across from the Neck to Plum Island in the teeth of a strong ebb tide with the wind kicking up an ugly chop. I believe now that our courage was born of ignorance rather than skill, but we did it not only once but many times, I never had any better fun, however than we enjoyed shooting coot inside the bar. My friend forward used the gun, and the tossing about on those long swells, while stealing up to a flock of birds or chasing a wounded one, was certainly exciting sport. After bringing her home, business demands became pressing, the weather became cold and the river closed with ice, so that the canoe has lain in the boat house for a couple of months without much attention from anybody.

I shall await with interest "Senorita's" promised account of cruise in Maine, and hope when he writes he will tell us what the sentiment of his shipmates is in regard to a meet of canoeists in this vicinity in the spr ng. We had a very interesting meet at Deer Leap, on the Merrimac last June, but canoeists from "Senorita's" vicinity did not muster in very large numbers. If the canoeing members of the Vesper Boat Club, of this city, had not turned out in force, the success of the meet would not have been very flattering to its promoters. I have no doubt that canoeists in Boston, Salem, Somerville, Haverhill, Lawrence, Manchester, etc., would like to gather around a campfire about next Decoration Day; but the thing must be started now if such a thing is to be. The Vesper Club, of this city, is not a canoe club, and there is some opposition, especially among its old friends, to allowing it to become such. Und r the circumstances I do not much blame them, for, having facilities in boat house, equipment and river for occupying a foremost place among amateur rowing clubs in the country, the opportunity is too valuable to be lightly discarded. I think there is nothing like canoeing, but this is a world of many minds and freedom must be given to all. It is possible, however, that this club will undertake the management of a canoe meet, considering the interest which a large number of members have in the sport. But I cannot answer for this. The club will have no meeting until their annual, in March, and it is rather late then to organize and carry out a successful meet, even if the project should have a majority in its favor. The two members of the club, who relied upon their A. C. A. connection largely to interest outside men, in last year's meet, are not inclined to undertake the management of one this year. And in fact, I do not think it wise that they should do so. Some plan of arrangement should be adopted in which all the clubs in this vicinity should have a voice. I assume that not many canoeists north of Boston are likely to attend the meets on the Connecticut, and I suggest this: If any interest is felt in the matter, let some one in Boston and vicinity call a meeting of canoeists to make arrangements for a meet. Let representatives of clubs and individuals who can come with suggestions as to place, number who will attend, routes of access, rates of fare, etc., and with a small sum to pay or guarantee for general expenses (I think the general expense of the Deer Leap camp did not exceed $10). Last year's location can be had if desirable, or there are other places on the Merrimac, both above Lowell and below Lawrence, while Winnipesecogee is not entirely impracticable. One thing is certain, if there is to be a meet in May, it is time the thing was talked up, and I have written this to show something of the sentiment in this vicinity. SIS.

LOWELL, Jan. 17, 1885.

THE LAKE ERIE MEET.

AT a joint meeting of the Cleveland Y. A. and the Cleveland C. C. held Saturday evening, Jan. 17, it was decided to hold a reunion at the islands about the 20th of July next.

Invitations will be extended to canoe clubs at Buffalo, Erie, Cincinnati, Sandusky, Toledo, Detroit, Chicago, Racine, Milwaukee, and other points to join with the Cleveland C. C. in forming a Western Branch Association.

The islands referred to are known as the Bass Islands, of which Put-in-Bay or South Bass is a popular summer resort, and during the season is in direct communication by daily lines of elegant steamers from Cleveland, Sandusky, Toledo, Detroit. On these islands are excellent facilities for camping, especially Ballast Island. This little gem is perhaps the most delightful of the whole group, a miniature Gibraltar containing about twelve acres of ground, and upon it is located a large dining hall and some dozen cottages. I understand through Commodore Gardner of the C. C. C., that this island will be made headquarters during the meet, and arrangements will be made to accommodate such canoeists as desire to camp there. There will be no difficulty whatever about accommodation, especially for ladies, who can occupy the cottages. The boat and icehouse on Ballast Island will shelter a large number of canoes.

The waters surrounding these islands contain numerous excellent grounds for paddling and sailing races. Put-in-Bay is itself a large landlocked harbor affording shelter from any storm. During the season of the proposed meet the wind blows steady and direct generally all day.

I hope to hear of our Western canoeists taking an active interest in this proposed meet and make it a success. I have been all over this territory bass fishing and canoeing and yachting, and know what I am writing. LONG SHANKS.

CLEVELAND, O., Jan. 28.

Editor Forest and Stream:

At a joint meeting of the Cleveland C. C. and the Cleveland Y. A., held in the rooms of the latter, the question of a summer meet at the Lake Islands was considered as the special business for which the meeting was called. The project of a canoe meet, which, by the way, originated with Commodore Gardner, who is chief in command of both organizations, had been informally discussed for some months previous, and the members of the club had become so thoroughly convinced that a revival of the waning interest in canoeing and a fresh inspiration could be aroused in no other way among Western men than by such a meeting, and the co operation of the Yachting Association, a strong organization, was sought to give an added interest to the occasion.

The Saturday meeting was largely attended, notwithstanding the bitter cold which suggested cosy indoors rather than an open sea, and the summer meet crystallized, after a thorough discussion, in a unanimous vote in its favor, and action was had at once. The date of the annual 4th of July regatta was postponed to the 16th, and the week beginning July 20 was agreed upon for the Island meeting. These dates will enable the home and foreign yachts taking part in the July regatta to reach the islands in ample time after the race, and such canoes as expect to attend the August meet of the A. C. A. can attend both, as the local committee propo es to make arrangements for the transportation of canoes and their boats direct from the islands by propeller to the A. C. A. camp, and no doubt is entertained as to our being able to secure most reasonable rates. The entire subject was referred to a special joint committee, as follows: Commodore G. W. Gardner; for the C. Y. A. Messrs. Downey, Gerlach and Williams; for the C. C. C., Messrs. Eckman, G. H. Gardner and Robison. The committee was given large powers in preparing a programme, deciding upon the details and issuing the necessary circulars and invitations. The committee is appointed to meet on Wednesday next.

Judging by the spirit manifested and the enthusiasm with which the proposition was received and acted upon, a success is guaranteed, so far at least as the management can make it so. Invitations will be sent to every canoeist in the United States and Canada so far as their addresses can be ascertained, and canoeists from every quarter are requested to correspond with the commodore or secretary of the Cleveland Club. Suggestions will be gladly received, and all inquiries will be promptly responded to.

The formation of a co-ordinate Western Canoe Association will be broached and considered, not in any spirit of antagonism to the mother association, but wholly with a view to a Western revival, and to give a better tone, increased vitality and a stable foundation to our organization as a national, or rather international association. That there may be some opposition to this proposition on the part of Eastern men is not doubted, but we of the West feel quite assured that the gentlemen will meet us fairly, giving us the benefit of their rife experience and profound study, and the announcement of the proposed meeting is made thus early to the end that the question may be discussed in advance, and that our Eastern brethren, the veterans of the Association, may so arrange matters as to give us a day or two previous to setting up their wigwams on Grindstone Island in August.

In my next I will furnish you with a full description of the locality selected for the meeting. W. H. E.

CLEVELAND, O., Jan. 19.

Editor Forest and Stream:

I have been waiting for just such a stir in canoe matters in the FOREST AND STREAM as "Corinne" has given us in his letter. Now that the ball has been started, we in Toledo are ready to lend our aid, and I think a dozen can be counted on from here. With such veteran paddlers as Com. Gardner and the Cleveland canoeists at the head, the enterprise must be a success. No better place than that mentioned by "Corinne" can be found. Let us now hear from other Western canoeists. HELPING HAND.

TOLEDO, Ohio.

Editor Forest and Stream:

For a Western meet, I think Chautauqua Lake would be preferable to Put-in-Bay. This place has already been talked of by the Pittsburgh, Rochester and Warren clubs, and I have no doubt but that Cleveland, Buffalo and other canoe clubs would join in selecting this or some other suitable place for a meet. L.

WASHINGTON, D. C.

BALLAST IN CANOES.

IT is rather significant that the two clubs whose sailing men use ballast more than other clubs, hail from New York and Toronto. I know other clubs do use it. Shot bags not made in either of the above places were to be seen at the last meet, and a good many inquiries were made as to where sandbags could be filled. Stones were used also, but so far as we can judge from reports of races the N. Y. C. C. and T. C. C. men carry more than others. In both cities the sailing is carried out on large sheets of water where a heavy sea can get up. In Toronto I cannot remember a single race having been won by an unballasted canoe. If the weather will permit in our races for the all round sailing cup the course is around the island. If the wind is in any direction but due north we must have a big sea. If from the east we have a sweep of nearly two hundred miles, and from any other direction not less than thirty. As a matter of fact, however, the sea that soaks us, and stops the unballasted boats is met with in the bay. The seas are short and steep. A canoe may get along nicely for a few waves but sooner or later she will tumble into the hollow of a big one, and receive a slap that shakes her from stem to stern, and if unballasted or improperly handled she will stop. To go about in such a sea is a very difficult operation with a light craft.

I have never sailed on tidal waters, but I can understand that sailing a light canoe in rough water and against a tide would be a very unpleasant proceeding.

I write the foreging, not because I think every canoeist should use ballast, but to show, if possible, that circumstances alter cases, and that while it may be foolish for a canoeist doing his sailing on a river or small lake to carry shot bags, it may be quite the proper thing for the members of other clubs. BOREAS.

KNICKERBOCKER C. C. WINTER CAMP-FIRE.

THE Knickerbocker C. C. have begun work in earnest for the coming season by inaugurating a series of club camp-fires, the first of which was held on Feb. 3, at the residence af Prof. Fowler, No. 106 W. 42d street. Five meetings will be held, at each of which a paper will be read, the programme being:

Feb. 17—"The Canoe and its Models," Mr. E. Fowler.
March 3—"Paddling and River Canoeing," Mr. J. L. Greenleaf.
March 17—Canoe Sails and Rigs," Mr. Wm. Whitlock.
March 31—"Canoe Navigation," Mr. C. B. Vaux.

The subject of the first lecture on Tuesday last was "The A. C. A. Regatta Rules." Mr. R. J. Wilkin, of the A. C. A. Regatta Committee read a very interesting paper, which brought out some important points for discussion. Mr. Wilkin divided the subject into three heads—classification, preparation and navigation. Under the first head he reviewed the Association rules and their amendments. Under the second Mr. Wilkin spoke of the necessity of a thorough familiarity with the rules before entering races; of the preliminaries, such as starting, distinguishing signals, etc., and under the head of navigation he reviewed the rules of the road as laid down in the A. C. A. book, in the course of which a very interesting discussion of the various combinations of meeting and passing which occur in all races were thoroughly discussed by those present. Many interesting points were brought out and elucidated by diagrams. At the conclusion of the lecture a vote of thanks to Mr. Wilkin was passed, after which the meeting adjourned. The next meeting will be at the same place, on Feb. 17, at 8 P. M.

PERSONAL.—Mr. S. R. Stoddart, of Atalantis fame, spent a half hour with us last week. Mr. Van Dalfsen, of Newburg, called on us on Monday on his way to Florida. He reports that Newburg canoeists are very enthusiastic over a spring meet, and are now refitting their canoes in good time. Mr. Van Dalfsen himself has a new No. 2 Mohican canoe. We have had a pleasant letter from Mr. Guilbert ("Camarada"), who has been in Mississippi since last fall on account of his health. He has done no canoeing, but is just as enthusiastic as ever, and hopes to resume the paddle soon.

BROOKLYN C. C.—The officers of this club, elected last week, are: Commodore, J. H. Hull; Vice-Commodore, J. F. Newman; Secretary, M. V. Brokaw.

CEMENT FOR CANOES.—See article on "Snell, Snood and Gimp," in Sea and River Fishing columns.

MOHICAN MODEL.—Com. Oliver's new boat will be 15ft. long instead of 14ft., as given last week.

Answers to Correspondents.

W. R., Jr., Philadelphia, Pa.—Yes, you can build and sell from the plans.

H. L., Brooklyn.—The scale is a little less than 2in. to the foot. The canoe is 14ft. long.

R. T., New York.—You can get Coast Survey charts of D. Eggert, 72 Wall street, New York.

G. B. Boston.—The price is $1.00 per year or 10 cts. each. Brentano Bros., No. 5 Union Square, are the publishers.

CONSTANT READER.—We will forward any letter for you. The boat would sink if stove in. She has never met the other boat.

DICK, Chester, Conn.—We have a duck here in Connecticut that is commonly called by the gunners on the river, whistler. I would like to know its true name in English. Size about the same as what they call raft duck in the South. Drake has dark green head, white breast, neck, black spots on back and wings. Duck has seal brown head, white ring around neck, grayish back with some black. In the neck of the birds, about half way from throat to breast, there is a knotty bunch of windpipe that seems to be different from any other duck I have ever seen. They seem to stay around the mouth of river all winter, and have certain feeding places where they dive to the bottom in five or six feet of water. Short, wide bill, yellow web foot. Flesh is yellow, and, I think, preferable to black duck. I have shot nine of them this winter. Don't think they would eat grain like other ducks. Please tell me if you can what I am killing, and if they are considered eatable. Ans.—Your bird is the golden eye duck, usually called "whistler" from the noise made by the wings in flight. Its Latin name is *Clangula glaucium americana*. It is common in winter along the Atlantic coast. It does sometimes eat grain.

MILLIONS OF DOLLARS WERE LOST by men who were accidentally injured in 1883, and not insured in the Travelers, of Hartford, Conn. The wise ones insured and drew $864,000 in cash benefits.—*Adv.*

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

For the Cure of all diseases of

Horses, Cattle, Sheep

DOGS, HOGS, POULTRY.

Manufactured by B. F. NICHOLS, 153 Milk Street, Boston, Mass.

Send for list with Massachusetts Fish and Game Laws.

Explanatory and Suggestive.

FOR THE CASUAL READER.

Arma virumque cano—"Arms and the man I sing." And, indeed, it would take the genius of a Virgil and the roll of Latin hexameters fitly to tell the deeds of this man, whose arms are shotgun and fishing rod. Go where you will, he is there. You run into him on the crowded city street, encounter him on cars and steamboats; he perches atop the country stage, bestrides the burro, and doubles up like a jacknife in the kanim. Seek out the most distant, most tortuous streams, his line has been wet in their waters; penetrate into the wilderness, the tin can of the sportsman's camp is yet further on. He goes for game—if the fates shall send anything within reach of his ammunition; for fish—if by good fortune a trout shall rise to his fly or descend to his worm. But, good luck or bad luck, game or no game, fish or no fish—fun always, fresh air, ozone, quicker pulse beat, brighter eye, more elastic step, all the multitudinous rewards, which, after all, outweigh the biggest "bags," and tip up the longest "strings." Is it not true that only a poet could tell his deeds as they ought to be told? Perhaps so. Perhaps not. He can usually tell them himself. And he does, with a thousand different pens, in a thousand different ways.

You may read it in the FOREST AND STREAM.

And that is better than if it were put into verse between book covers.

One who does not understand these things might imagine that after being told so often, this story of the man—him with the rod and gun—might in the end become hackneyed. But it is not so. Why? Well for pretty much the same reason, we venture to say, that the fields themselves and the woods and the lakes and the streams never become hackneyed. However that may be, one thing is certain. Our columns every week, and month after month, give ample proof that there is still an abundance to tell of what is seen and what is done afield and on angling waters; and that hosts of people still delight to read the telling, our subscription books show with ever increasing emphasis. The FOREST AND STREAM is in the best sense

A Journal of Recreation.

It tells of the recreation found by busy men, in out-door, open-air life. It *is* recreation to these same men and to others. Explain it how you will, this recreation found in the pages of the FOREST AND STREAM is different from the diversion afforded by other papers. Why? Because (it may be answered again) the recreations of field and stream are always ten times more potent for good than are those found in almost any other way.

Look through the pages and you will see that the departments include a pretty large field. It is a wide scope of subjects. But if you look carefully you will see that the paper, from front cover to back cover is homogeneous. What is in it belongs in it. There is not the mistake of trying to foist upon the reader, who is interested in angling and shooting, a lot of stuff about horse racing or base ball or prize fights. There is no sawdust-ring odor. Everything is redolent of the woods. There are plenty of other papers devoted to the other subjects. If you are interested in them, you need hardly spend time to read the rest of this explanatory advertisement. The FOREST AND STREAM'S field is broad, but it is not broad enough to take in all creation. The editors are perfectly contented with the scope of the paper as it is at present. And now

A Word About 1885.

For fifty-two weeks of the year 1885 we propose to publish the FOREST AND STREAM, and to fill each number with the same rich abundance and variety of reading that may be found in this present number or in any one of the five hundred numbers that have gone before it.

There will be the same delightful accounts of the adventures and misadventures of the *Sportsman Tourist*, and whether the "tour" be across a continent or only across the pasture lot into the woods beyond, the story in either case will be well worth the time it takes to read it. We shall have, now and then, a description of such excursions in foreign lands, but for the most part these columns will deal with what is seen and done in our own country, for that, after all, is what the readers of FOREST AND STREAM are rightly presumed to be most interested in.

The *Natural History* columns will give attention to varied forms of animal life, more particularly such as may come under the observation of sportsmen in their rambles. This department of the FOREST AND STREAM we believe to hold a place altogether unique. It is neither the dime-museum sort of un-natural history affected by the newspapers, nor the abstruse, fine-spun and terribly dry lucubrations of the scientific associations. It is intelligent talk about animal life, intended for intelligent readers.

In the *Shooting* and *Angling* columns (we need hardly say it) will be accounts of hunting excursions and fishing trips—with luck, good, bad and indifferent; discussions about matters mechanical, ethical, sentimental, fanciful and practical; some, after much debating, will be settled; others will be left (and the reader with them) at the end just where they were at the beginning.

The *Kennel* will give in 1885 (as it has given in 1884) the earliest, most accurate and the only unbiased reports of shows and trials, and it will be the endeavor of the editors to maintain for the FOREST AND STREAM in this special branch the position it now holds away in advance of anything else published in this country.

The *Yachting* columns are in charge of an expert, whose highest ambition will be to keep these departments in the place already won for them in the recognized lead of journalism. Though the *Canoeing* interest of the country is of comparatively recent growth, the FOREST AND STREAM fully appreciating its importance, has provided for those who sail or paddle a (pretty generous) corner, which is so full of practical suggestions and recountings of cruising experiences, that a canoeist might almost as well try to get along without a paddle as without the paper in his mail every week.

In a word—this is what we started out to say—in 1885 the FOREST AND STREAM will be newsy, bright, wholesome—a journal of out-door recreation.

Terms:—$4 per year, $2 six mos., 10cts. per copy. Sold everywhere. Make orders payable,

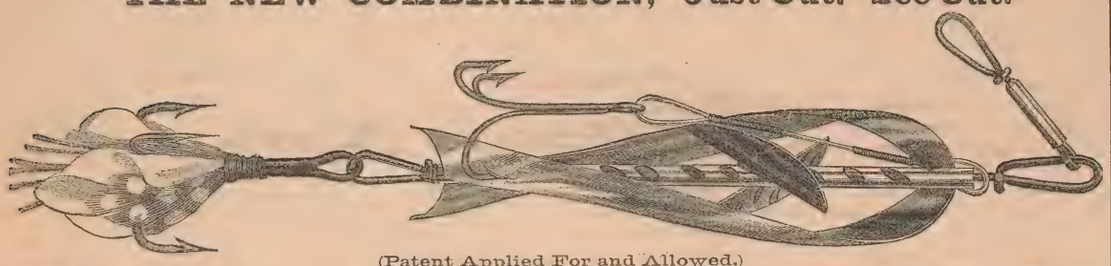
Whitney--Kennedy Repeating Rifle.

The Strongest and Best.



Many thousands in use. Greatly superior to any other Magazine Rifle yet made. The solid metal in line of fire at time of discharge renders the Kennedy ABSOLUTELY SAFE.

These rifles are made .38-cal. 40 gr., .44-cal. 40 gr., .45-cal. 60 gr., .45-cal. 75 gr., and .50-cal. 95 gr. (Express), using the same ammunition as other magazine rifles. Catalogues and price lists on application to the manufacturers.

WHITNEY ARMS CO., New Haven, Conn.

CHAPMAN'S BAITS STILL AHEAD!

"THE NEW COMBINATION," Just Out. See Cut.

(Patent Applied For and Allowed.)

In Three Sizes for PIKE, PICKEREL, BASS, TROUT & MUSCALONGE.

Read the Testimonials:

Chicago & Northwestern Railroad Depot, Chicago, Ill., Jan. 12, 1885.

W. D. Chapman & Son, Theresa, N. Y.:

As an old fisherman who has used your baits for the past twenty-five years, allow me to congratulate you on the success of your New Combination Bait for trout, muscalonge and bass.

It is very attractive, as the record of catches in Wisconsin last fall will show. I consider it the best bait in its different sizes made, and predict for it the largest sale of any bait ever made.

Yours truly, A. G. Ryther.

Chicago & Northwestern Railroad Company, Milwaukee, Wis., Jan. 1, 1885.

W. D. Chapman & Son, Theresa, N. Y.:

I take pleasure in testifying to the great merits of your New Combination Muscalonge Bait.

I gave them a good trial the 1st of last November and caught thirteen muscalonge in two and one-half days' fishing, without the loss of a fish, and two of the thirteen weighed over twenty pounds each. You will have a large demand for these baits; sportsmen must have them.

Yours very truly, John S. George.

To introduce these Baits at once, we will send by mail upon receipt of price:

No. 1.—Largest size, for Salmon, Trout and Muscalonge, $1.50. **No. 2.**—See cut, for Pickerel, Pike, Bass and Trout, $1.25.
No. 3.—Sure death to Bass, $1.00. All three sizes to one address, $3.50. **Try them at once.**

Catalogue and Price List to Dealers. Send Business Card. Catalogue to Sportsmen, without prices. 100 kinds of Baits.

READING POSITION

Mention this paper. Send stamp for Ill. Circular.

THE

This important work, now for the first time offered to the public, contains full life histories of all the quadrupeds of this State. These biographies are as different as possible from those too often found in scientific works; instead of being dry and dull

MAMMALS

they breathe the very fragrance of the woods and fields, and give us a close insight into the every day life of their shy inhabitants. To the lover of nature the work commends itself by its title. The hunter will need it for the complete account it gives of the habits of the deer, the hares and the

OF

squirrels. The farmer should read it because it tells him all about his enemies, the shrews and field mice who devour his crops, and about their enemies whom he would like to protect.

NEW YORK.

This interesting work is published in two volumes, the first taking the reader from the *Carnivora* (flesheaters) to the *Cervidæ* (deer), and the second concluding the subject.

BY

C. H. MERRIAM, M.D.

The volumes are superbly gotten up and are printed in large, clear type on heavy tinted paper.

We offer a few copies for sale at the following prices: Single volumes, paper, $2 each. The two volumes, paper, $3.50. The two volumes, cloth, $5.

Forest and Stream Pub. Co.,

39 Park Row, New York.

The English "Fishing Gazette."

Devoted to angling, river, lake and sea fishing, and fishculture.

Every Friday, 16 pages, folio, price 2d.
Volume VI. commenced with the number for January 7, 1882.

EDITOR—R. B. MARSTON

Free by post for one year for 12s. 6d. (say $3.20) to any address in the United States.

Sent direct from the office for any portion of a year at the above rate. U. S. postage stamps can be remitted, or money order payable to Sampson, Low, Marston & Co., the proprietors.

Contains special articles on all fresh and salt water fish and fishing; reports of the state of the rivers; reports from angling clubs: fishculture and natural history; where to fish; angling notes and queries; angling exchange column; notices of fishing tackle, books, &c., and other features.

A copy of the current number can be had (post free by sending six cents in stamps to R. B. Marston, the FISHING GAZETTE office, 12 and 13 Fetter-lane, London.

The FISHING GAZETTE circulates extensively among anglers and country gentlemen in all part of the Empire.

"There is a large public interest in fishing. . . An excellent class organ."—*World.*

"One of the best authorities on these and kindred subjects."—*Truth.*

"A brighter and gayer little paper is not published."—*Mayfair.*

The FISHING GAZETTE is quoted by the *Times* and all the best papers.

One of the best mediums for

WANTED.—FERRETS FOR BREEDING PURposes. Address F. A. S., Pawtucket Box 72 Lowell, Mass. feb5,1t

For Sale.

FOR SALE.

The ever reliable river St. Marguerite, the chief tributary of the Saguenay, descending from a lake far north of Chicoutimi, and famous for its salmon and sea trout fisheries, with all the proprietor's riparian rights, is now offered for sale. The St. Marguerite is distant 15 miles from Tadousac by water, or 10 miles over land. The riparian rights cover a distance of 30 miles, which is sub-divided into six sections, 5 miles apart. At each section are erected one commodious Gothic cottage, men's house, ice house, etc., etc. Each section has the control of six to eight salmon pools. Parties desirous of forming a club to secure the rights of the above valuable salmon stream, can so arrange it whereby twenty-four rods could have equal rights and splendid sport. For further particulars apply to WILLIS RUSSELL, Proprietor, Quebec, Canada, or to Messrs. GRANT BROS., 2 Exchange Court, New York City. jan8,7t

FOR SALE.—A SELECTED COPY, FIRST IMpressions, of "The Game Fishes of America." Price $40. Address G. F. A., office Forest and Stream. jan29,2t

Gordon Setter "ARGUS."

Argus is thoroughly trained for field work; has an excellent nose and great endurance. The following are his bench show winnings: 1st prize in Toronto, puppy class, 1880; 2d prize, London, 1881; 1st prize, Cleveland, also special for best Gordon setter exhibited, 1882, 1st prize, champion, Ottawa, 1883; 1st prize, champion, Chicago, 1883; 1st prize, Montreal, and special for best Gordon setter F, 1883; 1st, champion, London, also special for best Gordon setter dog in show, and special for best Gordon setter dog or bitch, 1883.

Argus has been awarded prizes under the following judges:—John Davidson, Major J. M. Taylor, Harry Malcolm, James Watson, W. J. Munson.

Stud Fee, $25.00.

STUD FOX-TERRIER

Champion Raby Tyrant,

(K.C.S.B. 11,179.)

Pupped October, 1880. Weight 16½ pounds.

Raby Tyrant is a white dog, with an even marked rich black and tan head. He is a thoroughly game and stylish terrier, possessing a beautifully shaped long punishing head, with perfect drop ears, small eye, rare neck and shoulders, deep chest, well ribbed and muscular quarters, short, straight legs, excellent feet, great bone and substance, with an exceptionally hard and dense coat.

Raby Tyrant is without doubt one of the most successful terriers of the present day. He has been exhibited 67 times, 33 different judges having adjudicated upon him, and has won 47. First 10 cups and specials; 12 second and 2 third prizes. His breeding is undeniable, combining as he does the choicest and most valuable blood that can be obtained. At the stud Raby Tyrant is proving himself eminently successful.

Fee, $15.00.

JOHN E. THAYER, Hillside Kennels, Lancaster, Mass.

Scotland Kennel Collies.

STUD DOGS.

Champion Robin Adair and Champion Tweed II.

BITCHES.

Champion Zulu Princess, champion Lassie, champion Lass o' Gowrie, champion Meg, Lilac, Elgg and other imported and prize winning bitches.

Puppies for sale from the above stock.

For further particulars and stud fee of dogs address THOS. H. TERRY, P. O. Box 2,017, N. Y.

Stud Bull-Terrier Dutch, Jr.,

(A.K.R. 1887).

This grand young dog, imported in November, 1884, possesses every requisite necessary for a most valuable stud dog. He has been shown but twice in this country, winning: 1st and special at Taunton, Mass. Dec., 1884; 1st and silver cup at Meriden, Conn, Jan., 1885. Stud fee $20. For further information, stud card, etc., app'y to owner, J. R. VARICK, Cambridge, Mass. jan8,tf

THE

ACME RUST PREVENTATIVE

Guaranteed to be the best article yet discovered for the prevention of rust on fire arms, tools and all metal surfaces when directions are followed. Specially adapted to guns used near the salt water. Samples mailed to any part of the United States and Canada on receipt of price, 15 and 25 cents. Satisfaction guaranteed or money refunded. Address E. VANDERWERKEN & CO., Stamford, Ct.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, FEBRUARY 12, 1885.

VOL. XXIV.—No. 3. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. Newsdealers in the United Kingdom may order through Davies & Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, London, Eng.

NEW YORK GAME BILLS.

A NUMBER of bills for the protection of game have already been introduced into the New York Legislature. Many of them cover amendments which are highly praiseworthy, and which, if passed and enforced, would do much toward lessening the rapid destruction of our *feræ naturæ*. The trouble with these bills is that there are too many of them. They cover too much ground, and try to reform too many abuses.

One of Mr. Coggeshall's bills omits the word "willfully" in connection with snared game, making the provision read, "Nor shall any person sell or expose for sale or have in possession" snared birds. This we have frequently recommended as a much needed change. The same bill provides that the time for killing woodcock, black and gray squirrels, and grouse shall be during the months of September, October and November, and that the sale of such game and of fresh venison shall be permitted only up to the first day of January; but the seller must prove that such game was lawfully killed during the periods allowed by the act, and must also make, and file with the nearest State game protector, a written inventory and report stating the species and number of the game had in possession, with proof that the same was lawfully killed.

Senator Fassett has introduced a bill forbidding the pursuing of deer with dogs in any county of this State at any time, except from the fifteenth to the thirty-first of October. It also shortens the time for selling venison. Other bills have been introduced, some of which we have seen while others have not yet been printed. The most important question which has come up during the present session has to do with the hounding of deer. It has been established that this hounding drives away the deer, and also that it is extremely fatal to them, not only because they can be easily destroyed after taking to the water, but also because, after a long race the sudden plunge into the cold waters of the mountain lakes frequently causes death, even though the hunter is not present to blow the beast's brains out with his gun, or to beat it to death with an oar. Moreover all the testimony goes to show that the heated flesh of a deer chased to death is not fit for food.

Public sentiment seems decidedly in favor of the abolition of this form of deer killing. We have received—besides those which we have printed—hundreds of letters urging the passage of such a law. Besides this, petitions containing hundreds of names and covering most of the counties where deer are found, and signed by men of all sorts and conditions, are coming in to us each day. These petitions pray the Legislature to forbid this form of butchery. That the proposed abandonment of hounding has the support of a larger portion of the community than usually take an interest in an amendment to the game laws, is very evident. If the change is to be made at this session, the energies of all who are in favor of game protection must be concentrated on this one point. There are other changes which are important, but this one overshadows them all, and if this point can be gained it will be a long step in advance.

A simple amendment without any unnecessary legal verbiage is what we need and what will be most likely to pass, and we strongly recommend a bill like the following:

AN ACT

To amend section one of chapter five hundred and thirty-four of the laws of eighteen hundred and seventy-nine, entitled: "An act for the preservation of moose, wild deer, birds, fish and other game."

The People of the State of New York, represented in Senate and Assembly, do enact as follows:

SECTION 1. Section one of chapter five hundred and thirty-four of the laws of eighteen hundred and seventy-nine, is hereby amended so as to read as follows: No person shall kill or chase any wild deer in any part of the State, save only during the months of August, September, October and November in any year. No person, corporation, association or company shall sell, expose for sale, transport, or have in his or her possession in this State, after the same has been killed, any wild deer or fresh venison, save only during the months of August, September, October and November. No persons shall, at any time, in this State, kill any fawn during the time when it is in its spotted coat, or have in his or her possession the carcass or skin of any such fawn after the same shall have been killed. No person shall, in any part of this State, set any trap, spring gun or other device, at any artificial salt lick or other place, for the purpose of trapping and killing wild deer. It shall not be lawful at any time to pursue deer with dogs in any county of this State. It shall be lawful for any person to shoot or kill any dog while in actual pursuit of any deer in violation of the provisions of this act. It shall not be lawful for any person to kill or cause to be killed, any wild deer in the counties of Suffolk and Queens at any time within five years from the passage of this act. Any person offending against any of the preceding provisions of this section shall be deemed guilty of a misdemeanor, and in addition thereto shall be liable to a penalty of fifty dollars for each wild deer or fawn so killed, or pursued or trapped, and for every spring gun so set, or wild deer or fawn skin or fresh venison had in his or her possession, and may be proceeded against therefor in any county of the State in which the offender or prosecutor may reside.

We are told that the bill introduced into the Assembly by Gen. N. M. Curtis provides for the prohibition of deer hounding in every part of the State and at all times. If this be so (we have not seen the bill), it covers the ground and should have prompt support.

NATIONAL GUN ASSOCIATION.

WE print on another page a draft of the constitution and by-laws of the National Gun Association which it is proposed to organize at New Orleans this week. An examination of the document will show very fully the purpose and character of the movement, and the practical development of the elaborate scheme will be watched with great interest. The success of the movement will depend almost entirely upon the personal efforts of the officers who shall be appointed to its charge. If they are energetic and clear-headed and feel sufficiently interested in the association to give their time and a deal of actual hard work to it, there is no reason why the Gun Association should not be all that its originators anticipate for it. If Mr. Bloom can succeed in infusing his own enthusiasm into these officers, this movement is sure of success and usefulness.

FATAL FENCE FATUITY.—A fence—a gun—a gunner. Then an Associated Press dispatch: "Chattanooga, Tenn., Feb. 8.—Yesterday while James Holden was out hunting he attempted to climb a fence with a gun in his hand. The hammer struck a fence rail, discharging the piece, the load of buckshot passing into his head, making a hole as large as an egg. He lived nearly an hour after the accident happened." We repeat it—Don't.

A POOR USE OF FISH.—At some summer resorts the hotel gardens are manured with fine game fish which have been taken by greedy fishermen. The stench from decaying fish has converted the sites of beautiful camps into noisome plague spots. This is a pretty poor way to use game fish.

TINKERING PROTECTION.

WHEN a tin kettle or pan gets leaky by rust or accidental punctures, it may often be made serviceable again by the tinker's soldering iron; but no one cares to pay the tinker to punch holes in his vessels merely for the sake of stopping them, nor to pile patch upon patch to see how much mending his kettle will endure. Yet more than half the fish and game law tinkering is quite as unwise and useless.

The opinion seems to hold with most of our State Legislatures that protection may be assured by an annual or biennial tinkering of the laws; that if the laws are made ponderous enough and obscure enough, their largeness and mystery will terrify and awe all ill-disposed persons into a strict observance of them. They never seem to consider that a law unenforced, or one so silly or unjust as to be unworthy of respect, is worse than no law at all. And so they go on, year after year, swelling the statutes with act upon act, and amendment piled upon section of the fish and game laws, and then—leave the laws to take care of themselves.

A BIG DIFFERENCE.—Some of our esteemed correspondents appear to have forgotten that the present discussion of Adirondack deer hounding does not involve any consideration of the merits of different methods of hunting deer elsewhere. There is no question of the evil effects of the practice as now conducted in the Adirondacks. We want to see that abolished, and we must decline at present to permit the discussion to wander from the definite case in point. There is a big difference between clubbing deer to death in an Adirondack lake or putting a load of buckshot into the victim while the guide holds it, and shooting deer on a run-way.

THE AMERICA CUP.—The first design for a large sloop with which to meet the expected Genesta has been begun. The work has been intrusted to Mr. A. Cary Smith, a choice which will meet with general approval. In the new vessel we may look for the best possible exemplification of the principles which have hitherto ruled the American yachting world.

TRAP-SHOOTING CLUBS cannot be too careful about providing plain and fixed rules for the government of contests. It happens almost every week that an appeal is made to us to settle some simple point, concerning which there would have been no possible wrangling had proper conditions been fixed beforehand.

IT WOULD NOT BE SURPRISING to see some of the big prizes at the New Orleans clay-pigeon tournament go "down East" again this year, and possibly there may be some attraction which will draw them to the Hub. The Massachusetts shooters are really the life of the New England Trap Association.

INFORMATION WANTED.—Some months ago we published information of a Long Island small-bird butcher's proposed trip to Florida. Can any one tell us whether this man is in that State now killing birds for their plumage?

DR. CHRISTOPHER GRAHAM, of Louisville, Ky., died in that city last week. His age was above 100 years. He was a personal friend of Daniel Boone. In our next issue we shall give some notice of his career.

NEW HAVEN SHOW.—Among the names of the judges at the New Haven show is that of Mr. John Davidson, a gentleman whom the public is pleased to see again undertaking the performance of such duties.

BATTERY-SHOOTING is now a subject of discussion in our game columns, and those who have sinkbox experience to give are urged to add their testimony to what has already appeared.

TOO MANY COOKS SPOIL THE BROTH.—There are four forestry bills before the New York Legislature. There are half a dozen different game law bills before the same body.

NEW JERSEY'S SONG BIRDS ought to be protected from the cupididity of New York millinery manufacturers.

THE MICHIGAN ASSOCIATION convened Tuesday. We shall report its proceedings in our next issue.

THE CUVIER CLUB held its annual reception at the club house, Cincinnati, last evening.

THROUGH TWO-OCEAN PASS.

III.—A CAMP ON YELLOWSTONE LAKE.

THE lengthening shadows of the pine trees warned me to set out for the camp which was to be on the lake somewhere near the outlet. The clouds which had been all day hurrying across the sky seemed to have concentrated in the northeast and looked threatening. I had twelve miles to ride, but Pinto was willing to go and responded readily to the touch of the rowel, and we were soon moving swiftly along the road at the long swinging gallop which seems scarcely more tiring to the tough wiry broncho than it is to his rider. A few miles from the Upper Falls, the stages which had started in the early morning from Marshall's, began to appear. The sad-faced jaded tourists, who were being jolted about in them, excited my commiseration, for they did—most of them—look very unhappy. And why should they not, traveling as they do at headlong speed and being whirled along from one point of interest to another, each of which they are obliged to examine in haste, and then leave to reach the next one on time? The railway companies sell excursion tickets, which allow five days in which to see the Park, and the holder of one of these fairly bounds from the railroad train into a wagon, in which he spends most of his time while he is in the Park. No wonder that he soon becomes worn out—so fatigued that the most wonderful scenes make little impression upon him. When he leaves the Park, he feels obliged to at least express some enthusiasm about it, because he has heard and read so much concerning its wonders, but his honest feelings are of disappointment; secretly he thinks that the region has been much overrated. He has been surfeited with scenery. This is no way to see the Park, and hereafter I shall endeavor to show how, with great comfort and at small expense, the tourist can visit this region and thoroughly enjoy every minute passed there.

Four miles from the Falls I turned off the main road and took the one leading up the river to the Lake. Although following along close to the stream, the forest for much of the distance conceals the water, but occasionally glimpses of it are to be had.

The old mud volcano, which many years ago was quite active, has now apparently ceased its eruptions and is partially dried up, though it still boils and steams fitfully in a few places. The so-called Devil's Workshop, a great black cave in the hill to the right of the road, is, however, still active, and gives forth great volumes of steam with the same dull throbbing or pumping noise for which it has always been celebrated. In the hillside very near at hand, and easily recognized by the white cloud which ever rises from it, is a large circular mud spring, perhaps twenty feet in diameter. Thirty feet below the edge of the opening is a boiling, seething mass of dark gray liquid mud constantly in motion, which appears to issue from a hole in the side of the hill at the bottom of the crater, and then to be sucked into it again. Hot, sulphurous steam rises in clouds from this boiling mass and wets one side of the crater wall, which is here curiously streaked with bright copper green and rich brown. There are numerous other hot springs and sulphur vents here, which have been fully described by various writers.

The road to the lake is an attractive one. It leads through forests, sometimes of living green, at others dead—killed by the fires which have in the past been kindled by Indians or careless and malicious whites. Here and there are pretty grassy meadows, and from them charming views may be had of the river, which, as we approach the lake, becomes broader and spreads out over wide flats. To the right the mountain rises sharply, and forms the Elephant's Back, about 1,000 feet in height.

There are broad openings on the shores of the lake near the outlet, where the grass grows thick and rank, and here a dozen years ago, a Long Island bayman named Topping built himself a cabin on a little point jutting out into the water. With an ordinary whipsaw he cut planks from the pine logs of the neighboring forest, and with these constructed a skiff and a catboat, in which he used to transport the few visitors to the lake across to Steamboat Springs, or out to the various islands. Topping left his cabin and moved out of the Park years ago, and the boats soon after went to pieces, and since then there have been none on the lake.

In the marshes, pond holes and sloughs in the river near where it leaves the lake I saw many flocks of mallards and Canada geese, and sandpipers and bay birds were noticed feeding along their margins, and a few coots in the shallow pools. Although especially numerous at the outlet and at the mouth of Pelican Creek, ducks and geese are abundant everywhere on the lake, and flocks of the latter frequently flew along the shore within gunshot of our camp. A number of swans were seen and a few pelicans, though these last seemed much less numerous than I have seen them in former years. Every one seems to take pleasure in shooting these great birds, which are quite worthless as food and yet are so interesting a feature of the bird life of the lake. Half a dozen carcasses of pelicans shot that summer were seen near the outlet, which had evidently been killed in pure wantonness.

The trout fishing in the Yellowstone Lake is good, if we consider only the size and abundance of the fish. Although there are some points along the shore especially favorable for casting, it is an easy matter to catch plenty of trout from almost any point of rocks, and even from the sloping gravelly beach. During the afternoon of the day we reached the lake two of the men in a short time caught twenty or twenty-five fish here, and after dinner, just at dusk, I set up my rod, and using a white miller for a tail fly, made a few casts from the shelving beach in front of the tents. The first fish that I struck was logy and dull, and in a very short time I was able to draw him out on to the beach. The second one made a much sharper fight, and kept the pliant bamboo on the strain for quite a little while, before I dared bring him to the water's edge.

The following afternoon, just before sunset, I strolled along shore, and took seven or eight fish, all of which I returned to the water, as there were several others out fishing, and they could be trusted to secure enough to supply the table. There was nothing like uniformity in the fighting qualities of these fish. Many of them made little resistance—for trout—when struck, but occasionally one would take the fly, which afforded fine sport. One very large fish sprang a foot or two out of the water just as I was recovering for another cast, and seizing the fly at the critical moment, snapped the line an inch or two above the leader, and made off with my whole cast.

These fish would weigh from one to two pounds each, and are enormously abundant. Unfortunately they are afflicted with a parasitic worm which takes up its quarters in the flesh just beneath the skin, where it lies coiled up in a knot, usually forming a slight protuberance which can be readily seen or felt. Sometimes, however, they are deeper seated and within rather than on the flesh. If the fish were thoroughly cooked, no doubt they could be eaten, without any unpleasant results, worms and all, but the idea of using food of this kind is not an agreeable one, and all the fish caught were skinned and carefully examined, and those in which the parasites were found were rejected.

These worms are about the thickness of a knitting needle, somewhat flattened, and occasionally attain a length of over two feet. Specimens submitted to Professor Leidy were pronounced by him to be nearly allied to similar parasites of the European salmon, but a new species, which he described under the name *Dibothrium cordiceps*. They seem to appear first in the intestines, and thence after a time make their way into the flesh.

During the greater portion of our sojourn on the lake the weather was fine, and while this was the case the mornings and the evenings were usually calm, but toward midday a fresh breeze rose, tossing up tiny waves which rippled on the beach with a soft, pleasant murmur.

Yellowstone Lake lies about 7,700 feet above the level of the sea. It contains 150 square miles of water, and there is probably no other lake in the world of equal size at so great an elevation. Roughly speaking, its shape is like that of an open hand which lacks the first and middle finger. The wrist is at the northern end of the lake, the West Arm answers to the outstretched thumb, and the South and Southeast Arms to the "ring" and little finger. It is a lovely sheet of water; for the most part serenely picturesque, lying like a great sapphire beneath the unclouded sky; but sometimes, when the autumn storm clouds gather about the mountain tops, and becoming black and threatening, roll down their sides, when the fierce cold winds whistle through the cañons and ravines, and make the pines toss their branches about and sigh and moan, the dark waters rise in fury, and white-crested waves hurry shoreward, tumbling in upon the beach with the hoarse tumult and the volume of the ocean's surf. Shut in on all sides by the somber green of the pine forest, the lake gleams brightly under the summer sun, the loveliest spot in all the Park. Above its blue waters is the narrow, gray line of beach or bluff. Above that are the pines, clothing the mountain side with verdure, and then, higher still, rise the snow-clad pinnacles and ridges of half a dozen mountains, whose white crests are sharply projected against the unclouded sky.

From whatever point it is viewed, the lake is beautiful, and its beauties never pall on the senses. The more familiar one becomes with its scenery the lovelier it appears. There are a hundred views from its shores, of water, and island and timbered point, and bold promontory, and curving bay and smooth green hillside, and beetling crag and white snow-cone, each different from all the others, and each possessed of a charm which is all its own.

Our first camp on the lake was delightfully situated on a bluff about fifteen feet above the beach. The tents standing among a grove of noble pine trees, faced the southeast, looking out over the broad expanse of waters toward a shore that was eight miles distant. To the east, far back from this shore, rose Mt. Chittenden, to the southeast Mts. Doane and Langford, and still further to the south, up the valley of the Upper Yellowstone, the black peak of Turret Mountain, then Flat Mountain, and beyond it Mount Sheridan and the Red Mountain Range. Of all the grand peaks and ranges which from the outlet meet the eye, Sheridan is the most imposing. This is due not less to its apparent height than to the great mass of snow which covers it.

A mile or two from the shore to the southeast is Stevenson Island, long, low and timbered, which, distinctly seen, throws back the remainder of the landscape into the further distance and gives a charming effect. At evening as the sun was setting and had already begun to fall behind the Elephant's Back, a curious green light would spread over the whole lake. Then gradually the waters changed from green to blue, and from blue to pale purple, and the shadows crept slowly up the mountain sides toward the peaks. Their snowy crowns took on a rosy glow, and then faded and grew cold; twilight hung its veil over the scene, and one by one the brilliant stars stood out in the heavens. As we watched, the shadows grew heavier, the distant mountains were lost to view, and then a pale clear radiance appeared in the opposite sky, and before long the glorious harvest moon rose above the eastern hills and laid a broad straight path of living waving silver upon the heaving waters.

The Sportsman Tourist.

TO MY OL' DAWG DRIVE.

WHEN ye wag y'r tail an' yelp, a-snoozin'
Clus' t' the fire this froze-up weather,
'S y'r dreams to comin' times a-cruisin'
Er back to them 't we've had together?
Which is 't, ol' dawg?

Good times we've had, an' many on 'em,
No man an' dawg 't I know 's had more;
We've got 's much fur as any on 'em,
'N' of ri' daown fun as big a store—
Han't we, ol' dawg?

Sen' fust I took to guns an' huntin',
A many dawgs I've raised an' had;
But I can say withaout no stuntin',
Though more was good 'n the' was bad,
You're best, ol' dawg.

If we could live to be a hunderd.
In everlastin' lojin summer;
'N' I never missed 'n' you never blundered,
We'd stan' aside for some new-comer,
Most willin', dawg.

But twelve year ol', an' deaf 's a post,
Blind of an eye, an' rheumatizy;
You'll go in tew three year at most,
Leave me 'n' the gun, wi' naught to busy,
Withaout no dawg.

I will say this, if nothin' stronger,
Though findin' fault wi' Natur' 's wrong,
I wish 't dawgs' lives 's a leetle longer,
Erless men's lives wa'n't quite so long;
I du, ol' dawg!

DANVIS, Vt., Jan., 1885.—*Editor Forest and Stream:* DEAR SIR—These lines, found in Mrs. Huldah Lovel's ragbag, like those which I have before sent you, I forward to you to do with as you see fit I was not acquainted with Mr. Samuel Lovel, and do not know whether he was a good, bad or indifferent speller, but in his verses I think he must have written as nearly as possible as he and his neighbors spoke. It is quite common here even now, in speaking, to drop the i from "is," the a from "as," and sound only the n in "an," "and" and "than." "Stunt" is always used for "stint," except when an allotted task is meant; then it is "stent." With these explanations I hope you will have no difficulty in understanding him. With great respect, yours, HORACE MUMPSON, Schoolmaster in Dist. No. 13.

UNCLE LISHA'S SHOP.

VIII.

THE south wind had been roaring for forty-eight hours after its first piercing chill, softening the snow so that it took the imprint of the foot of man and beast as sharp and clear as an impression in wax; then bringing to its surface weeds and tops of knolls, then making it so splashy that the brooks burst their bonds and overran them in swishing yellow floods, when one January night Lisha's friends came straggling in over the sloppy roads. The talk ran naturally to tracking 'coons, which the weather favored, then to the life and habits of the animal.

"Wal, boys," said Lisha, splashing a tap in the tub, "s'pose ye'll all be arter 'coons termorrer, won't ye? This thaw 'll fetch 'em aout."

"Wal, I d' know," Sam Lovell answered; "I kind er thought I'd take a little turn arter 'em 'f nothin' happens."

"Dat what we 'll call it chat sauvage in Canada ah guess so, 'coon? Dat same ting ah 'll hear it sometam rrrac-coon? Yas?"

"Sartinly, Antwine," said Solon Briggs, "'coon and raccoon is what we call anonymous terms for one and the same annymill. Raccoon, I expect, is a Latin or Greece word, which 'coon is the English of it."

"Then grease is their name as well as their natur', for they 're the fattest creeturs," said Sam.

"Naow, Antwine," asked Solon, "what might be the true meanin' an' interporation of 'shaw syvadge'?"

"Wall, M'sieu Brigg, lemme see, ah 'll tole you—chat, he mean cat, an' sauvage, he mean he don't tame—m-what you call 'em wil'? Chat sauvage, wil'cat, on'stan'?"

"Hm! yes, wildcat, or to speak more eggzack, puttin' the cart afore the hoss arter the French fashion, 'cat wild,' similar to 'shovelnware' for a black hoss, which 'shovel' means hoss an' 'nware' means black. Naow, hain't that a most onnat'ral-hist'ry name, so to speak, for a 'coon or a raccoon, which it hain't noways the natur' of the feline race, but much more resemblances a bear, a layin' dormouse in winter an' catin corn an' shack as much as meat victuals as no critters of the cat speshy do?"

"Sartin, Solon, you're right," said Sam, "a 'coon 'ould make a first-rate little bear 'f 'twan't fer his tail. He's jist as independent, an' hoggish, an' sorter cunnin'-foolish, an' fond of water an' mud, an' sweet-toothed, an' hot-toothed tew, fer he'll dig wild turnips an' eat 'em jes' 's a bear will. Haow on airth any critter 't ha'n't got its maouth an' insides lined with sheet iron, can chaw an' swaller a green wild turnip 's more 'n I can understand. Why, it's wus 'n forty thaousan' red hot needles a jabbin' int' yer tongue, 'f ye ever bit one."

Almost every one present confessed to having been fooled in the days of his youth by some rough practical joker into tasting the bulbous root of the plant, whose snake-like spathe should warn one that it biteth even like a serpent and stingeth like an adder.

"Wal, naow," said 'Lisha, laying aside his lapstone, shoving his spectacles on to the top of his head, and resting his elbows on his knees, "that makes me think of a man 'at I knowed 'at come tu his death along of foolin' a boy with a wild turnip, 'n' I d' know but what it sarved him putty nigh

right, naow ra'ly I don't. His name was Bijer Jarvis. Why, some on ye knowed 'im; he use ter run the sawmill up in the Notch. He was a red-headed, cross-grained, ill-natured creetur, 't would wruther see folks in hot water 'n aout on 't. Good airth an' seas! 'f I ha'n't spoke in meetin', fer he was Peltier's uncle! Peltier's mother was a Jarvis. But she wa'n't to blame fer it, 'n' I haint goin' to spile a story fer relation's sake, so ye need n't take no pride in what I say, Peltier."

"Houh! Gol darn Uncle Bige! Blast his ole picter!" exclaimed Pelatiah, "he never done nothin' for none o' aour folks only cheat father aout 'n a yoke o' tew o' ole steers, so I hearn 'em tell. Ye need n't spile no stories 'baout him on my 'caount, Uncle Lisher."

"Wal," Lisha continued after this little interruption, "Bijer was a runnin' the sawmill, an' one mornin' when he was a goin' 'long the road through the woods to the mill he seen a wild turnip an' pulled it, an' kerried it 'long, thinkin' mebbe 't he'd dry it agin he had a cough in the fall, for some sets gret store by wild turnips dried an' grated an' took in 'lasses for a hackin' cough. Curous, haint it, 't when they're dried they ha' no more taste into 'em 'n a piece o' chalk? Wal, he mogged along to the mill an' rolled a lawg on t' the kerridge an' dogged it an' histed the gate, an' jist then there come along a boy a fishin' of the name o' Morrison, an' stopped to see him saw. He was al'ays a gawpin' raound, lookin' at the contraptions an' askin' questions, more 'n boy-fashion, for he seem to be kinder studyin' inter 'em, 'n' they said 't he made a reglar little sawmill complete, kerridge, rag wheel an' all, an' sot it a runnin' in a brook clus ter his folkses. It al'ays made Bijer crosser 'n two sticks to see him raound, 'n' he didn't take no notice on him till bimeby he happened to think of the turnip, 'n' he sat 'im 'f he liked apples, 'n' he said he did, for who ever see a boy 't didn't? Then s' he, 'did ye ever eat any sweet graound apples? Here's one o' the sweetest ever ye see,' handin' on 'im the turnip; 'take a bite on it.' The boy took a good bite an' chawed it kinder slow, lookin' at Bijer, but Bijer looked turrible honest, 'n' clever 's he ever could, so the boy didn't think nothin'. In tew three minutes it begin to take holt, 'n' then he begin to sputter 'n' spit 'n' cry, an' holler 't his maouth was full o' bumblebees an' hornets, 'n' Bijer settin' there on the lawg goin' into fits a laughin' at 'im, till the boy cleared aout mos' crazy with the fire in his maouth, 'n' Bijer didn't see nothin on 'im agin for a month, till one day he popped up ahind a pile o' boards a shakin' his fist at 'im an' hollered, 'You ole red-headed heap! I'll pay ye some time, see 'f I don't,' 'n scooted aout o' sight 'fore Bijer could fling an aidgin' at 'im. All this while an' arter, things kep' gittin' aout o' kilter 'raound the mill; sticks in the wheel, bull-wheel rope wore aout 'n' breakin', saw duller 'n a hoe, all kinder onaccaountable, no body knowed haow. Bime-by long late in the fall when the pond froze over, Bijer was a fussin' 'raound the bulkhead one day, choppin' a lawg loose or suthin' nuther, 'n' bime-by he broke through an' went in kersouze! 'n' he couldn't git aout, for the ice wouldn't hold an' the lawgs an' bulkhead 'n' things was all ice so 's 't he couldn't keep no holt on 'em, 'n' the water all the while a suckin' his laigs int' the flume. Jest then he seen that 'ere boy come skatin' 'long the pond, 'n' he hollered for him to reach him a pole or a board, but the boy kep' a skitterin' 'raound a laughin' at 'im, an' say-s he, 'Ole redhead, don't ye wish 't ye hed one o' them sweet graound apples to warm ye up? Mus' be kinder cool bathin' in there. I'd go 'n' dig ye one 'f 't wa'n't all froze up.' Bijer begged an' cussed an' sploshed 'raound, an' cussed an' begged, 'n' last when he was mos' tuckered aout he begin to pray, 'n' then that 'ere imp of a boy hooked a pike pole into his cut-collar an' hauled him on t' the ice 'n' snaked him ashore. He couldn't stan' 'n' the boy went arter somebody 'n' they kerried 'im hum. He never got well agin arter, nor able to walk. Some said 't was rheumatiz 'n' some said 't was dyspepsy in the laigs—I do' know. One day the nex' summer when they'd sot 'im aout on the stoop tipped back in his cheer, that 'ere darned boy come along 'n' stood 'n' gawped at 'im. Bimeby say-s he, 'Mr. Jarvis,' say-s he, 'I've brung ye suthin 't 'll do ye good. I've took lots o' trouble to git it for ye.' 'N' he pulled an' alfired gret wild turnip rut aout'n his pocket. 'Take a bite an' chaw it dawn,' say-s he, a shovin' on it under his nose; 'take a bite, I've owed ye one more'n a year.' Bijer gin a kinder start, 'n' the hind laigs of his cheer slipped 'n' he come daown ker lummux! 'n' hurt his head some way so 's 't he died in a week or tew. 'N' that's what *he* got for feedin' boys wild turnips."

"Bah gosh! Ah guess wen he begin to dead he'll sorry he foolish dat boys, an't it?"

"That boy," said Solon, "was vindictative."

"I do' know as that was what they called it," said Lisha; "seems though they said he was injiunew-ous. Any way he went off, 'n' they say 't he's what they call a injin-near on one o' them 'ere steam railroads daown in Massachusetts somewheres."

"Dew you think, Sammywell," Solon asked, getting back to the subject under consideration, "that the vocal voice of a 'coon resemblances a screechaowl?"

"Wal," Sam answered, "I do' know. Some says that a 'coon does make a noise sometimes 'at saounds suthin' like a screechaowl, only kinder hoarser. I had a tame 'coon onct for most a year, but I never hearn him dew anything but graowl when he was mad, an' squall when he was hurt, jes' you've hearn 'em when a dawg hed a holt on 'em. He was the cunninest little cuss! Inter all the mischief he could think on, an' more tew. The chickins hed to suffer when he got into the hen haouse, evey time, 'n' he'd raise tunkit with everything he could git into in the haouse. When he was eatin' he'd keep a sozzlin' his grub in his pan o' water all the time. Uncle Lisher makes me think on 'im evey time he sploshes his luther in his tub. Shouldn't wonder, Uncle Lisher, 'f you turned into a 'coon yit."

"Darn'd 'f I wouldn't like tew part o' the year, Samwill. Wouldn't it be cute to curl up when the col' weather come on an' snooze till spring or a thaw come, an' not haf to bother gittin' wood or grub?"

"Ye'd want to take yer 'long pipe with ye, an' some terbacker an' matches in yer pocket when ye went inter a holler tree—'t would be lonesome goin' without a smoke so long."

"Naow, does 'coons hev pockets?" asked the man who never spoke but to ask a question.

"Course they dew," Sam answered shortly; "inside pockets, 'n' I d' know but cut-tail pockets an' trowses pockets. An' then agin, Uncle Lisher, when the' come a thaw an' ye turned aout an' went traipsin' raound an' somebody tracked ye into another tree, haow 'd ye like to hev 'm cudd aown the tree 'n' knock ye in the head?"

"'T would be you, Samwill, 'at faound me, an' you'd know me by the smell o' luther, 'n' you wouldn't hurt yer Uncle Lisher. 'N' I'm glad you made me think on 't, for I guess I'd ort to hev a smuk afore I turn into a 'coon." Whereupon he cleaned the bowl of his pipe with an awl, ran a waxed end through the stem, blew through it, and then shaving some tobacco from a plug on his cutting board with a shoe knife, was presently in the full enjoyment of what he called a "ri'daown good smuk."

"Ah bet too he a'n't fregit when he be 'coon as' you, Sam, haow you lak it you boot, an' when you tole 'im he too tight he say 'he straysh!' Wen you tole 'im he too loose, he say 'he shrimp!' Hein, Onc Lasha, you don't fregit dat, a'n't it?"

"Arrrh! You dum peasouper!" Lisha growled, like a good-natured bear.

"'F you want fur," said Sam, "trackin' 'coons on the snow 's all well 'nough, but it's mortal hard work wallerin' in the soft snow all day. But 'f you want fun an' music, take yer dawgs an' hunt 'em nights in cornfields, an' when they've ben shackin' under sweet acorn trees, an' sometimes you'll strike a track 'long a brook when they've ben a froggin'. Hev tew three good haoun's a hootin' on a track fer a good spell, an' then singin' halleluyer raound a tree! That's what I call fun alive! Some druther hev a cur dawg, 'at won't bark till he trees, but gimme more music, 'f I've got to hev less 'coons.

"Wal," said Lisha, ramming his pipe with the handle of his awl, "eveybody to their notion, 's the ole woman said when she kissed her kyow, but I could n't never—sen' I was a boy—see no gret fun in stumblin' raound in the dark 'n' fightin' skeeters half the night, for one or tew 'coons with 'baout as much hair on 'em 's the' is on the back o' yer hand, 'n' like 's not, not git nary 'coon arter all."

"Why, Uncle Lisher," said Sam Lovel, "is that ra'ly your idee of the fun o' huntin', jest to git suthin' that's wuth money? Seems to me, if fur an' meat 's all a feller 's arter, he aint goin' to git no gret comfort aout on 't."

"Shaw, Samwill! you haint a goin' to ondertake to make me b'lieve 't you don't feel better a bringin' hum a fox skin, er a 'coon skin, er half a dozen patridges, 'n' ye dew comin' hum wi' nothin'? I know better 'n' that."

Of course I like to git suthin' to show for a day's hunt, an' it's comf'table to the feelin's to make a good shot, but 'f I didn' tnever git nuthin' only what I c'n show, I sh'ld stay to hum more 'n what I dew. If dollars an' cents an' suthin t' eat was all I was arter, I'd snare patridges 'n' trap foxes, an' you never heard o' my doin' nary one."

"Wal, then, Samwill, what on airth dew ye go for? Ye hunt more 'n' 'most any body I know, an' ye git more game."

"I can't hardly tell, Uncle Lisher. It comes nat'ral for me to run in the woods. 'F I do git more game to show for it 'n' some does, I git suthin besides 't I can't show. The air o' the woods tastes good to me, for 't haint ben breathed by nothiu' but wild creeturs, 's 'n ole feller said 'at useter git up airly daown in Rho'd Islan' where my folks come from. I luffter breathe it 'fore common folks has. The smell o' the woods smells good to me, dead leaves 'n' spruce boughs, 'n' rotten wood, 'n' it don't hurt in none if it's spiced up a leetle bit with skunk an' mink an' weasel an' fox p'fum'ry. An' I luffter see trees 'at 's older 'n any men, an' graound 't wa'n't never plaowed 'er hoed a growin' nat'ral crops. 'N I luffter hear the stillness of the woods, fer 't *is* still there. Wind a sythin, leaves a rustlin', brooks a runnin', birds a singin', even a bluejay a squallin', haint noises. It takes folks an' waggins an' horses an' cattle an' pigs an' sech to make a noise. I git lots o' things a huntin' 't I can't show ye nor tell ye 'baout, an' a feller that don't, don't git the best o' huntin', 'cordin' to my idee."

"I do' know but what ye've got 'baout the right on 't, Samwill," said Lisha, after smoking slowly and gazing for some minutes out into the dark through his long window. "I do' know but what ye hev, Samwill. Wal, boys, 'f ye 'r goin' arter 'coons termorrer ye'll want'er sleep some fust." And he arose and took off his apron. Presently the wooden latch clicked behind the last departing guest.

CAMP FLOTSAM.

XIV.—"THE ELYSIUM OF PERENNIAL BASS."

ON the day before the arrival of the new comers, we started out, intending to make the lower outlet of Loughborough and follow the stream to the falls, and after carrying around these to the smooth water below, to work over into Crow Lake, some twelve miles to the east. It was a rather ambitious undertaking, for it was nearly eight miles to the outlet, and in case night overtook us so far from our base, we might not have an altogether pleasant time of it. After discussing the expediency of taking a tent fly for shelter against a night out, we determined to make no extra preparation except in the way of lunch, and if belated, to trust to making our way to camp in the dark. An extra pair of oars were put in the boat, the provisions stored, and we stood off to the north. A couple of miles from camp, where the lake narrowed in toward an island, which loomed up midway between the shores, the company separated, Truthful James to take the eastern shore while we turned off to cast along the western. This latter was thickly wooded to the water's edge, and with an occasional log submerged a foot or two below the surface or projecting that distance above, suggested the presence of big-mouths, and likewise warned us of the trouble which would probably ensue should we get a strike from beneath such convenient covers. It is one of the weaknesses of the angler that he can never resist temptation when it presents itself in this shape. We yielded to the enticements of the surroundings, and stripping off a dozen feet of line, made a cast squarely alongside a log which lay parallel with the shore with half its length above the surface. We felt in our bones, while we were making the forward cast, and before the flies touched the water, that there was trouble on hand; and it came, came with a tug and a dash under the log, and we were fastened as firmly as though tied to one of the trees on shore. Lowering the tip to the water, we passed the line under the end of the log, brought it to the opposite side, and tautened it with a quick upward movement. This had the desired result; there was another rush, this time toward the shore, a turn, a dash for the log, and we were fast again. The same tactics freed the line once more, and we had an open water fight for a few seconds just clear of the log, which ended in spite of our efforts owing to the position of the boat, by another retreat to the cover. This time the fish did not stop under the log, but rushed three or four feet beyond, where it broke water, and we were treated to the sight of a small-mouth as large as any which we had yet taken. But it was our only view, for as it left the water and tightened the leader, there was a snap, and the leader parted just where it came in contact with the log, and we felt the trouble in our bones no longer. We repaired the damage, and about fifty feet further on tried the same experiment with another log, and got out of the scrape with the loss of the dropper. Our next experience was at a log which stood nearly upright, and here we landed a villainous pike, after he had sawed the gut of one of the flies until it was just ready to part. Before we had gone fifty yards further, we were minus another leader and flies; but not before we had seen the destroyer, a four-pounder, show himself in a grand quivering leap. After that we gave the logs a wide berth, and half a mile further on found a somewhat bold and rocky shore where the water was free from obstructions. Here, within a distance of two hundred feet, we struck and landed five bass, which averaged two pounds apiece.

It is perhaps needless to add anything to the discussion of a subject which can now be regarded as fairly settled—the superior fighting qualities of the small-mouth over the big-mouth bass. We venture to assert that the few champions of the latter have never found the small-mouth in the glory of his perfection. We have fished in waters where their fighting qualities were about evenly balanced, but in all these the small-mouth was not up to the standard, and this undoubtedly has been the case when a conclusion so favorable to the big-mouth has been reached. We can name waters where eight out of every ten small-mouth bass will, when hooked, break water, and this is a fair, if not a true test of their gaminess. When the big-mouths adopt the same tactics in like proportion, they may be put on the same plane. This leads us to assert another fact sustained by our experience, viz.: that the small-mouth is a more vigorous fighter in waters where it is not a native; transplanting seems to infuse a new vigor and to add several degrees to their gaminess. What says he of the Bigosh to this?

A couple of miles further on, Truthful James met us at an island midway of the lake. He outnumbered us in his catch by several, and had met with no mishaps like our own. Here we exchanged shores, and our oarsmen soon put the width of the lake between us. By the time we had added a half dozen to our score, the water began to grow shallow, and we found ourselves over a muddy bottom. Before we were within half a mile of the outlet the keel was stirring up the black deposit. The last forty rods were made with considerable labor, and we reached the stream down which we expected to pass only to find that there was not enough water in it to float a canoe. We beached our craft on a grassy bank, just at the entrance to the outlet, saw our lunch and tackle on shore, and then stretched ourselves under a tree and awaited the coming of Sabattis. When he arrived he was sent down the stream to examine and report on the feasibility of further progress. He soon returned with the information that to reach Crow Lake a carry of a mile would be necessary, as the water was almost entirely out of the stream. As no one man could carry either of the boats, we abandoned the expedition right there. It was now after twelve o'clock, and we started in search of a place where we could spread our lunch and enjoy a noonday hour. Directed by Sabattis, we followed a trail for a quarter of a mile, crossed a little run, turned short to the right, and a few rods beyond found a clear, cold spring in the dense shade, with a large fallen tree hard by on the bank above. Here George and Sabattis brought our lunch and then left us to ourselves.

The memory of that dreamy summer noon comes up to us now, amid the wintry blasts, and we picture to ourselves the ice-bound stream, the ravine piled deep with snow and the solitude and desolation of that pretty trysting place, in the middle of the Canadian winter. There we lounged while two long hours "sweat her sixty minutes to the death," and our thoughts never once turned to where the waves of human life were surging and dashing and beating themselves into naught but empty bubbles and foam. Our isolation was as complete as though we were in "the desert behind Algiers," and when in response to our signal call, two dark-hued forms came up the trail, representatives of world-separated races, alien in sympathy and aspiration with our Aryan blood, it only made wider the gap which opened between us and the century's civilization, a civilization in which they had no part nor place.

The expedition to Crow Lake being abandoned, we turned our faces toward camp. On our way thither we took about a dozen bass, none of them being remarkable for weight. That night came the first warning that our summer camp was drawing nigh its end. A letter had arrived which sounded of the world, and summoned us to join once more in its toil. Such a summons had come to us in other years, but never found us so unwilling to obey as now. While we knew full well that the end would soon be at hand, it struck our heart with a feeling not unlike that which used to come with the sharp rap of the master on the door post of the old school house on the hillside, when at the end of a glorious noon spell he called us to unwilling tasks.

When the lawyer and the editor arrived another tent was added to the settlement on the bluff, and another boat to the fleet on the beach. Their first day out was marked by the capture of twenty-five small-mouths, and they were in ecstacies over the fishing. On their second morning in camp, while all were at breakfast, George announced that "Santiago was a coming," and soon that worthy presented himself. He had come to tell us that he had just found a new ground which was alive with bass. The editor left his breakfast unfinished and, without waiting for the others, rushed to his boat and was soon put in place by Sabattis who then left him and returned to camp. Before the rest of the party were ready to set out, a series of whoops broke the quiet of the morniug, coming across the bay from the direction of the fishing ground. From the bank below the tent we could see the editor, a full mile away, and could assure ourselves that he had not fallen overboard, but whether his yells were the result of colic, cussedness or raw material, we could not tell. It was, however, thought best to investigate.

As we pushed off from the shore the yells came with increased volume across the water, and some one thought that he heard a "hurrah" mixed in with the rest. It was suspected just then that the lone fisherman, deprived of his politics in camp, had taken advantage of the retired location to give vent to the same, and that he was "whooping it up" for somebody. By the time we had passed over half the distance we could see that he was standing; at two-thirds of the distance it looked as though he was engaged in a walking-match. The rumpus was meanwhile being well sustained, and at ten rods we were able to grasp the situation. The editor was bare-headed, his hat was hung on the bow of the boat, his rod was bent half double and he was playing circus with some kind of a fish which he was taking at "a forty gait" around the boat, in an elliptical-shaped course, between the foci of which—the bow and the stern—he was

making repeated and rapid trips. We watched him while he put three bass through a ring performance and landed them, and then pulled alongside. His boat was half filled with water, and he looked as though he had been overboard. George was directed to bail the boat, and after the water had been lowered somewhat it looked like Sabattis' fish box. The cause of the noise was now apparent. The editor had taken fourteen bass and had given way to his excitement in the whoops which we had heard a mile away. In a few minutes his boat would have been swamped, as he had evidently stood much of the time on the gunwale.

After his boat had been put in trim the editor resumed business. We anchored a few yards away and were soon joined by Truthful James. That day we attained the climax of bass fishing; we had found "the elysium." More than once each of the four members of the party was playing a fish at the same time. There would be a lull for a while in the proceedings, then suddenly the Ku-Klux mask would take on a fiercer expression and his lithe Mitchell would go into action with a curve and a spring, the lawyer would surge back with his heavier rod, and the act would close by the editor throwing off his hat and starting another circus.

By a little after noon every one felt that to fish much longer would be an inexcusable slaughter, if it were not such already. We had taken over a hundred bass, nearly all of which were small-mouths, and were content to rest for the remainder of the day. Our fish were distributed among the dwellers at the outlet, the camp and Sabattis coming in for a full share. Our visitors were more than delighted; such fishing they had never before experienced.

Grand as we found the fishing, Truthful James bore witness to the fact that it did not equal that of four years since. During that period it has been on the decrease. No reason to ask why. That being which curses every water with his presence from Maine, along the St. Lawrence, the lakes of New York, the Delaware, the Susquehanna—but why enumerate. The pot-fisher, the fish hog, the pest that ought to be shot on sight, has found this lake, and in the spring months strings his hoop-nets along its shores. The Dominion has game laws, to be sure, but these permit the granting of licenses to set nets for "skin fish," *i. e.*, catfish and eels. Two enterprising individuals therefore secured, to the exclusion of all others, a license to set nets in Loughborough Lake and for "skin fish!" If reports be true they skin fish with a vengeance. Two barrels a week have been sent to market in the towns along Lake Ontario. What they contained no one at the lake was allowed to see, but they were "skin fish" concerns no doubt. A complaint has been made to the Minister of Fisheries, or some such officer, and an investigation has been promised. The man with the net deserves the same heroic treatment that his compeer with dynamite receives at St. Petersburg and Berlin.

Four more days of fishing, less remarkable for the catch than the one above mentioned, but days nevertheless of royal sport, followed, and the week closed; and with it our guests departed, the lawyer to Montreal and the editor to his home.

And now came the summons for Truthful James, and our thoughts began to take a new shape and to wing their way over the border, where we knew a furnace heated tenfold was awaiting our coming. Our peace was well-nigh gone, and there only remained to extract what pleasure we might out of the few remaining days. The time was so fixed for our respective departures that we would be left alone in camp for several days after Truthful James had token his leave.

Do what we would the thoughts of the coming break-up were ever upon us—an incubus which oppressed, and from which we could not escape. WAWAYANDA.

Natural History.

"THE BIRDS OF LONG ISLAND."*

AN INTERESTING VOLUME OF FORTY YEARS AGO.

GOING into the office of a friend the other day, the talk drifted into a question of ornithology. In determining it he dived into his desk and brought up a plain and rather dingy muslin-bound book, entitled "The Birds of Long Island," published in the city of New York in 1844 and copyrighted a year earlier. So much was I interested that I carried it off in order that I might look through it a little more at leisure. And I venture to subjoin a few extracts, not for the scientific knowledge, but that the present readers of the FOREST AND STREAM may note some of the changes that have occurred in various directions since the days when Illinois, Iowa and Indiana were still the western extremes of civilization.

The writer in his classification and further treatise begins with the *Vulturinæ*, of which family the turkey buzzard was the only member on Long Island, and closes with the *Colymbinæ*, represented by the divers and grebes. Between these he touches briefly or at length on the several hundred species native to the island, following principally the nomenclature of Wilson and Audubon. But with the work as a scientific text book the present mention has nothing to do, and the few extracts which are appended are perhaps sufficiently self-explanatory.

Under the head of *Ortyx virginia*, after calling attention to the fact that the naturalists having placed this bird under the genus partridge, we have, therefore, properly speaking, no quail in this country, the author says:

"Four species of partridge are known to inhabit North America, but the California (*Ortyx californica*), the plumed (*Ortyx plumifera*) and welcome (*Ortyx neoxenus*), have only been found in the western part of the continent. The present (*Ortyx v.*) the only species found within the limits of the United States (sic) is very generally distributed throughout the Union, though more abundant in the interior. In the month of January I met it in great numbers in the States of Indiana and Ohio. In the Western States shotguns and pointer dogs are but little used [!!]. The hunters find sufficient employment for their rifles upon larger game, and consider the common American partridge too insignificant to waste their ammunition upon, while their tables are supplied with the savory flesh of the wild turkey and deer. Thus this species continues to multiply, having nothing to contend with except the severity of the weather, or an occasional descent made upon it with nets, though this unsportsmanlike method, particulary in the interior, is but little practiced. As its flesh is not so highly prized as by the fastidious palates of our city epicures, and being so plenty, and so far removed from the markets of the river towns, as a source of gain it would prove unprofitable."

"On Long Island it is quite abundant, notwithstanding this famous shooting ground is visited annually by a great number of sportsmen." * * * "Mr. Audubon states that in Texas, the Floridas, and as far east as the neighborhood of Charlestown, S. C., it breeds twice a year; first in May and again in September, and with us it is by many believed that it rears two broods. With those who are of this opinion, I am inclined to disagree. During the season of shooting, we notice quite a difference in the birds of the year, I admit. The younger of these, I am disposed to think, are the first offspring of their parents, which are later in hatching than those that have bred for several years, or it may occur when the nest has been broken up before the eggs were hatched; and in persisting to raise a brood the female may lay a second time, but in general, I am well persuaded that they do not, with us, rear more than one brood during the year. * * * The eggs of the partridge have frequently been hatched by the domestic hen; the birds have remained with her during the first season, but on the return of spring obeyed their native instinct and took to the fields—although it is the opinion of naturalists that with proper care they could be domesticated."

Of the ruffed grouse our author says: "On Long Island it is quite plentiful, inhabiting generally the middle portion of the island, particularly the chain of hills known as the 'Spine,' which from its formation is best adapted to its habits. I have procured a number in Duchess County on the rough lands adjacent to the Hudson River. In Orange county they are abundant, and are also found in large numbers in the mountainous country that borders the valley of the Delaware."

Here are two stories told by the writer anent ruffed grouse which certainly deserve a place in the column of "Remarkable Shots:"

"In the autumn of 1839 while two of my friends were in pursuit of the American partridge [quail], their dog put up a ruffed grouse. Both gentlemen fired at the same instant, and seeing the bird lodge in a tree both claimed the prize, each supposing that his shot had taken effect. On arriving at the spot they found the bird impaled on a small branch, without having received a single pellet. On another occasion a gentleman started a grouse near Weehawken, N. J.; before he could fire the bird dropped dead. On taking it up he found the skull broken, it having flown against the limb of a tree with such force as to produce instant death."

Speaking of the pinnated grouse, the writer deplores their extinction. "On Long Island the 'prairie hen' is very nearly, if not entirely, extinct. Thirty years ago it was quite abundant on the brushy plains in Suffolk county, which tract is well adapted to its habits; but being a favorite bird with sportsmen, as well as commanding a high price in the New York markets, it has been pursued as a matter of pleasure and profit, till now it is doubtful if a brace can be found on the island. * * * At Martha's Vineyard, I am informed, it is quite plentiful, and during the winter a few are exposed for sale in the New York market procured at that place."

The good people of New York had game laws even in those primitive days. "On the first of July the act which prohibits the shooting of woodcock expires." Further along Mr. Girand quotes from a city ordinance then in force: "No person shall bring into any market, or sell or offer or expose for sale any woodcock, in any market or other place in the city of New York, between the first day of February and the first day of July of any year, under the penalty of ten dollars for each offense."

One more quotation, and I leave the subject: "The brent geese" (brant) says Mr. G., "are very fond of sanding, and resort to bars for that purpose * * *. The bar known as Fire Island bar, on the south side of Long Island, is a celebrated place for procuring them. It is rented to two brothers by the name of Allibу at $120 per annum, and I am informed that these men send to the New York market annually several hundred dollars' worth of birds, the larger proportion of which is brent. * * * In 1838 a law was passed in this State prohibiting the use of batteries. For a short time it was respected, but the gunners who depended on water fowl shooting for a great part of their living considered it such an invasion of their rights that they defied it, at first shooting with masks, at the same time threatening to shoot the informer, should one be found. They finally laid aside their masks, and the law became a dead letter and has since been repealed."

"The Birds of Long Island," I presume, is long since out of print; but it certainly contains a great deal of matter quite as valuable to-day as when issued. J. B. B.

TOLEDO, O., Jan. 27, 1885.

HOW TO IDENTIFY BIRDS.

A FEW years since I made an offer in the columns of FOREST AND STREAM to identify any specimens of North American birds sent to me for this purpose, either in the flesh or as skins, the same to be returned if desired. At frequent intervals I have received specimens and much interesting correspondence from widely separated localities, from the Canadian Dominion to Texas, and from the Atlantic to the Pacific coast.

I wish now to repeat this offer, and make a few suggestions in connection therewith.

Small birds may be preserved for several days, even in warm weather, by removing the intestines, wiping out the interior of body, mouth and throat with a swab of cotton or cloth so as to remove all blood, and thereafter placing gum camphor inside the mouth and body. A bird should be thus prepared as soon as possible after death, placed smoothly in a paper roll or cone, and sent by mail in a box or roll of pasteboard. Memoranda notes of date and locality of the capture of each specimen should be sent, either attached as a label, or by letter, as also any other information of possible value or interest.

Birds of considerable size can be sent in similar manner, if not badly mutilated.

Of course, in the greater number of instances, it would be best to send the skins of birds, especially if at a distance of more than two days' journey, by mail.

Small birds may be preserved for a day or more by merely placing crumbs of gum camphor in the mouth, and inclosing some with the body in its wrapper.

Students of ornithology will observe that in nearly all of the published writings of American ornithologists of the present time the descriptions of species are chiefly devoted to the coloration of the plumage.

Do not, however, regard coloration as of prime importance, lest you be frequently led astray; but refer to it only as of secondary importance, of value in corroboration of other characters.

Whenever desiring to identify a bird by observation of its external features, examine first the *form and proportions* of the bill, feet, wings and tail, *without regard to color of plumage.*

When, after this examination, attention is given to coloration, do not restrict it to the plumage, but note carefully the coloration of the eyes and eyelids, bill, mouth and tongue, and the feet and claws. When skinning birds, always note the sex and contents of stomach of each.

Objects of natural history may be sent by mail as fourth class matter, with written labels attached, at rate of one cent per ounce, each package not to exceed four pounds' weight. EVERETT SMITH.

PORTLAND, Me.

THE BIRDS OF MICHIGAN.

BY DR. MORRIS GIBBS.

(Continued.)

8. *Galeoscoptes carolinensis* (Linn.) Cabanis—Catbird.

Just why this plainly-clad bird is so often an object of contempt and dislike is a point rather difficult to explain satisfactorily. The poor fellow is credited with committing all sorts of depredations, not the least of which is indiscriminate stealing and nest robbing, and people generally think him capable of the most atrocious deeds. The country urchin will inform you that the catbird is a "real mean, whining, nest-robbing thief," and he stones him whenever opportunity offers, and looks upon him as an interloper and ranks him lower than a skunk or a snake. This is all the result of vulgar prejudice.

The plain colors of the subject of this sketch is hardly a fair point upon which to found a prejudice against him.

The catbird rarely emerges into plain sight, as does the robin, and if he appears in view and sings for a few moments, the chances are that something will occur to cause him to plunge into the thicket; and then the whining, cat-like notes are heard issuing from the depths of the bramble patch and row of garden bushes, and we see no more of him, unless it is to catch a hasty glimpse of his active form as he scratches among the leaves on the ground and shyly eyes us askance.

Undoubtedly the skulking nature of the bird and its disagreeable call notes are the principal unfair counts against this, to me, pleasing, sprightly bird. It is unfortunate for the catbird that it cannot elevate itself to a dignified position. But fate evidently is against it, and the poor fellow is doomed to remain below the elevated sphere of bird life in the estimation of most of those who misjudge it; although, let us trust, that even with its plain colors and not winning ways, it endeavors to maintain its own standard in society and succeeds among its feathered associates.

Professor Coues says: "There is a dead level of bird life, as there is of humanity, and mediocrity is simply despicable," and therefore the poor catbird is relegated to the lower order of bird society.

The catbird comes to us so regularly during the latter part of April or early May that we are not at all surprised at hearing the vehement, jerky song issuing from the usual retreat, and upon closer inspection the songster will be found quite near to the last year's nest, where so many broods of young have been reared. This bird has a remarkable tendency to return to the same spot with the season, year in, year out. Perhaps no other bird, excepting the familiar robin, has the inclination to so repeatedly return to a favored nesting site.

The catbird arrives from April 20 to May 2, according to the season, and leisurely spreading over the entire civilized portion of the Lower Peninsula, his eccentric song is soon heard by all passers by, in thicket, orchard and hedgerow. The eggs are generally deposited by May 15, rarely earlier. About the last of the month is the time for collectors to secure a series of sets. The nests can generally be found in such numbers that one day's trip by a good collector is usually sufficient for a lifetime.

The nest is usually placed about five feet from the ground, but never, to my knowledge, upon the ground, and rarely over ten feet above it. In make-up the structure is principally composed of twigs—some of good size—occasionally considerable straw and plenty of strippings of weed stalks. It is nicely lined with fine roots and presents a compact appearance, although a bulky affair for the size of the bird.

The eggs, usually four in number, are of a bright greenish blue, and are remarkably handsome, though not generally considered so by oölogists because they are so common. Two broods are generally reared in a season.

By October 10 not a catbird is to be seen in Kalamazoo county, and the characteristic whine or call notes, which are all that the bird vouchsafes after the nesting season is over, are rarely heard later than September 20.

The song of this well-known bird is peculiar in the extreme, composed, as it is, of the snatches of other birds' songs, uttered in a desultory, jerky manner in combination with its natural notes.

But if one will take the time to carefully analyze the song, the notes will be found full of melody. Not so clear and full as the robin's, but nevertheless exceedingly musical and harmonious.

This bird is a great favorite with me, and the true lover of birds cannot fail to become possessed of a friendly feeling toward it if its habits are closely studied.

9. *Harporhynchus rufus* (Linn.) Caban.—Brown thrush, brown thrasher.

This species, the largest of the family, is conspicuous from its bright rufus upper parts and long tail. It is known to all, and is common with us from April 20 to Sept. 15. The first arrive in Kalamazoo county as early as April 12, and are often found in numbers by the 15th. The last to leave in the autumnal migration are seen until October.

The eggs are frequently found as early as May 15, and from this date to July 15, fresh eggs and young can be found plentifully. The nest, a bulky affair, is placed quite often on the ground or within a foot of it, and is rarely found ten feet up. Occasionally a nest may be seen all of fifteen feet from the ground, but such cases are rare exceptions. Brush piles, bushes and rail fences generally form nesting places for the homes of the thrasher in civilized sections, but occasionally a nest is placed in a peculiar situation, entirely different from locations usually selected. One nest that came under my observation was built in a hollow on the side of a stump, three feet from the ground.

The eggs, four in number—sometimes only three and rarely five—are so thickly dotted with fine markings of reddish brown as to almost obliterate the light greenish back ground,

Two broods are probably reared in a season, but to this I cannot positively attest. Those nests found late in season are undoubtedly second nests, but the birds may have been influenced in this second effort by a breaking up of the first one, through the evils of amateur egg collecting. The nests built well up from the ground are more often found in late June, and we may attribute the change in position from that usually chosen, to the destruction of the first nest by floods, or some other cause of which we are ignorant.

We connect this bird in our thoughts with the edges of fields and thickets, farms and pasture lots. We rarely find the brown thrush in the city, and in this respect it is unlike others of our favorites, the swallow, robin and oriole.

We expect to find the thrasher at some distance from farmhouses, at roadsides and along the fenced borders of fields, or in open woods where there are huge brush piles in clearings. We do not often learn of an instance where a nest is occupied in such proximity to a tenement as that frequently selected by the robin. It is a much more shy and wary bird, ever on the alert, liking the presence of man, but not familiar. It is best pleased when quite the width of a field from a house, where it can build its nest in a low, neglected apple tree, a hawthorn, or on the ground near a fence, often quite concealed beneath a log.

Here, mounting to the top of the tallest tree near its nest, it pours forth ecstatic melody, executing the most difficult strains with the same ease that it delivers the simplest notes. All noises are attempted; the schoolboy's whistle, the bark of a dog, or the bleating of a lamb are equally well executed and issue from its throat in a continuous, harmonious strain, frequently of an hour's duration. Occasionally a note is heard from this bird rarely heard by ears of our populace, the thrasher having learned it in other sections of the country.

I remember distinctly hearing one often repeating in its madcap song some notes new to my ear, which could not be ascribed to any Michigan bird of my acquaintance. After patiently waiting for some time in the glaring sun of a bright June day, I heard the notes so plainly that I was thoroughly convinced they were an imitation of the song of a southern bird—the "chuck-will's widow," so called, a species allied to our whippoorwill, and named—as in our familiar northern representative of the family—from the words so plainly uttered. This thrush learned, then, the notes of the chuck-will's widow at least five hundred, and probably quite a thousand miles from Michigan, and yet reproduced them so distinctly that one could easily distinguish them, and from mere descriptions in books at once tell the name of the bird imitated. What wonderful mimicry; what a contrast to the best attempts of ventriloquists and imitators, traveling through the country to reproduce before audiences a few mumbled sounds or attempted imitations of the sounds and notes uttered by birds and mammals.

While singing in the top of the tree the thrasher will, without warning and almost at the time of the utterance of its notes, often drop from its lofty perch, and with a few flirts of its long tail, suddenly enter a thicket, or alight on and run along the fence rails. If one passes by he may be seen coyly eyeing the stroller. Should the collector be too intrusive the parents become greatly alarmed, and, though keeping well out of the way—even if the nest is disturbed—show great uneasiness, and at such a time their lemon-colored eyes look actually fierce. The characteristic notes *tset, tset,* are often vigorously repeated as long as the intruder is near, but as soon as quiet is again restored the male quickly ascends to his former perch by a series of flapping of the wings and awkward plunges, and once more opens song as if the whole world was listening, and not alone his patient setting mate.

This exquisite singer is one of a few of our birds which sing during the hours of darkness just before dawn. It gets up so early in the morning as to cause one to doubt whether there is any sense in arguing that "the early bird catches the worm," for if all birds were to arise as early, some of them would have to sit up all night in order to secure a chance at breakfast. The thrasher is frequently heard singing at 3 A. M. during the months of May and June, and I have heard the song as early as 2 A. M., quite a half hour before any others of the diurnal birds had loosened their vocal chords and all of an hour before the general morning concert began. The song sounds out of place in the dark and often chilly night, while yet the owl is lurking for his prey and the whippoorwill still quavers forth its monotonous weird notes. At such a time it has often been my lot to travel over rough country in Montcalm county, and while driving over the mountain woodland logging roads, beset with stumps of all sizes and innumerable roots, and surrounded by stately dark pines, the distant song of this cheering singer in the dismal night is indeed pleasantly hailed as the horse picks his way through the sand and brush.

The thrasher appears to be restricted in its northern range within our State, and seems as yet to be confined to the Lower Peninsula. At least it is not recorded in any of the lists of Upper Peninsula birds. Kneeland fails to embrace it in his list, which gives 147 species. It is, however, undoubtedly found north of the straits. It is quite common near Petoskey. Throughout the counties in Central and Southern Michigan the brown thrush is an abundant species, and though not found so common in heavily timbered sections, is still known to nearly all of the settlers, and with the farmers it is familiar to all from its peculiar coloration. The species usually, if not always, follows civilization, and is undoubtedly little seen or entirely unknown in many quarters covered with pine. It is probably from the fact that the northern peninsula is so heavily wooded that it has not yet been recorded from that locality.

———With the conclusion of the thrasher's biography we complete the history for the present of the members of this family, and, therefore, a few remarks relative to the merits of the thrushes as promotors of good will not come amiss to the agricultural readers of this papers. It will be our custom to speak of a family collectively after describing each species in it, and to venture a few remarks as to relative merits of the birds in the family.

The thrush family comprises one of the most important groups of birds, and the nine species known to visit our State are generally considered by the farmers as their principal allies. It is, however, no more than proper to say that the value supposed to be derived from the thrushes is greatly overestimated, and careful dissections, made within the last few years, have fairly demonstrated that much accredited the members of this family is not their due.

Careful examination of the stomachs of hundreds of specimens of the different species of thrushes, made by prominent entomologists recently, have quite conclusively proven that myriads of predatory species of beetles are devoured by the various thrushes, which would—if they had not been destroyed—have been of great service in destroying other insects most prejudicial to the agriculturist's interest. Convincing proof may be had by reference to several articles published on this subject. A simple example will be appropriate as illustrating one peculiarity of the robin known to all. We are all familiar with our robin's preference for earth worms; still we learn that the earth worms are invaluable to the farmer in enriching and partially cultivating the soil. It has been repeatedly noticed by many that a robin never takes from a tree a cherry that contains a worm or grub. They have been frequently watched, with the invariable result that the pilferer is always seen to select the largest and most perfect cherries. It seems strange that a bird considered so beneficial to man, and generally known as almost entirely insectivorous, should reject a fat grub for a cherry. In this case the robin is at fault, and though many uphold them in their attacks on our fruit, it is a lamentable fact that to the fruit grower such inroads on the crops on which he depends are often a serious loss to him. If left to themselves, a neighborhood of robins will quickly strip a row of trees of their good fruit and leave only infected cherries to propagate the germs of disease in next season's crop. Such a condition is practically irremediable excepting by recourse to the gun, and even this mode of procedure will often fail unless followed severely from day to day. The robins are our favorites, but the enormity of their crimes is often quite glaring.

If careful comparison could be given, it could easily be proven that the robin is one of the least useful of our birds, and quite as destructive—in fact, to my view, more so, than that pest of the Nineteenth century—the English sparrow. But who would have the robin exterminated? Not I. It should not be understood that I am one to prefer the pertinacious sparrow to our robin. On the contrary, I do not wish to place on paper one traitorous thought, but in actual justice to the miserable interloper, I feel it no more than proper to say that while it feeds upon the garbage of our streets, the robin is living upon the fat of the land at least four months in year. The brown thrush is, to my view, the most beneficial member of the family; the wood thrush ranks next, while the catbird is next to the robin in point of destructiveness. I feel safe in saying that at least three families, the swallows, warblers and woodpeckers, are decidedly superior to the thrushes as destroyers of noxious insect life. After the completion of the biographies of our Michigan birds, we shall attempt partial statistics of the different families beneficial to man, relative to the food of various species. For the present such a table would be out of place.

The following table embraces dimensions of Michigan birds, the measurements being copied direct from my own observations as taken from freshly killed specimens.

NAME.	Average length.	Average wing.	Average extent.	Average tail.	Average tarsus.	Average Commisure.	Greatest length.	Longest wing.	Greatest extent.	Shortest Specimen.	Shortest wing.	Least extent.
Hylocichla mustelina.	7.81	4.30	13.16	3.03	1 30	1.03	8.25	4.51	14.50	7.44	4.11	11.88
Hylocichla fuscescens.	7.30	4.04	12.39	3.07			7.58	4.13	13.80	7.00	3.99	11.64
H. ustulata, swainsoni..	7.11	4.09	11.12	2.96	1.09	.87	7.51	4.25	13.50	6.75	3.69	9.74
H.unalascæ pallasi.....	6.99	3.67	10.97	2.94	1.23		7.24	3.88	12.00	3.65	3.50	10.34
Merula migratoria....	9 33	5.25	14.35		1.38	1.06	9.80	5.95	16.00	7.70	4.88	11.75
Galeoscoptes carolinensis	8.48	3.52	11.27	3.95			8.85	3.68	12.00	7.96	3.35	10.16
Harporhynchus rufus.	11.50	4.00		5.35	1.35	1.25						

HAVE IT IDENTIFIED.—Would you kindly inform me whether there is a species of gull on our coast called *Larus fuscus*, a specimen of a gull a little over half the size of *Larus marinus*, with the same coloration and general build, was taken by me on Feb. 2, 1882, at Bay Ridge, L. I. A fine male specimen of *L. marinus* was secured by me on Jan. 12, 1882, and mounted with the above mentioned by a Brooklyn taxidermist. I find no mention of *L. fuscus* in Dr. Coues's work.—A. L. T. (New York, Feb. 1). [*Larus fuscus* is not a North American species. If you will loan us your specimen, we will have it identified for you and return it.]

CAGED MOCKING BIRDS.—Columbus, O., Feb. 4.—In Tennessee I have seen young mocking birds confined in a cage within reach of the old birds. The old ones brought them food, and remained near them several days, trying to induce them to follow their parents, but when these efforts failed they were abandoned to their fate; no attempt being made, however, to poison them as related by "Doctor."—O. N. G.

ANOTHER BROWN THRUSH IN NEW JERSEY.—*Editor Forest and Stream:* On Thursday, Jan. 31, I shot a brown thrush (*Turdus rufus*). This is the second one I have seen this year.—CHIP (Englewood, N. J., Feb. 6).

STATEMENT OF THE MUTUAL LIFE INSURANCE COMPANY, of New York, F. S. Winston, President, shows assets of about one hundred and four millions of dollars, invested in the very best securities in the world. During the year 1884 the company paid out to its members for death claims, endowments, annuities, dividends and surrendered policies nearly fourteen millions of dollars. The receipts during the year for premiums and interest were over nineteen million dollars. The surplus under the State laws exceeds twelve million dollars, and the condition of the company is most satisfactory to its policy-holders, and must be equally so to its managers. Mr. Charles H. Raymond, so well known to sportsmen generally, and especially to lovers of fine setters, is the General Agent for New York, and will, we are sure, be glad to furnish any information to applicants.

"I do not know how the inclosed will strike you, but if it does not strike you right, drop it and open the rest of your mail. It was written to kill time in a recent snow blockade."

A DEER HUNT IN KENTUCKY.

HAVING been frequently importuned to give a description of a day's hunt in Kentucky through the columns of your paper, which is always a welcome visitor, I comply, hoping thereby to give answer to such inquiries: "Who shot that deer you sent to the club? It was a tame one, wasn't it?" and many more of a kindred nature.

About the 1st of December found me on a business tour at Grayson Springs, the famous watering place of that name, in Grayson county, Kentucky. If space permitted I would give you a short sketch of its many attractions, but I must content myself with only a reference to the generosity and hospitality of my host, Captain Van Meter, his brother Charles, and very obliging brother-in-law, Mr. P. Clarkson, the clerk of the establishment, who I believe is the most thorough lover of the chase of any man I ever met.

In the office, to which I was escorted, there was a bright, cheerful wood fire, in an old-fashioned fire-place, around which were some half dozen Kentuckians, who courteously gave me a chair in the circle. This was a novelty to me; and when the landlord introduced me, and called one of these men, dressed in homespun, Mr. Boone, it was difficult to separate time and space and scene from the days and scenes of the elder and pioneer Boone of Kentucky.

During the evening, the Captain having learned that I had never seen a deer in a wild state, said if I could spare the time he would be pleased to give me a little taste of Kentucky sporting before I returned to New York. I gladly accepted the offer.

Thursday, Dec. 16, was set down as the day for a deer hunt. About 7 o'clock in the morning of that day, after having eaten a hearty breakfast, I went into the office and found Mr. Clarkson loading the guns and the Captain giving orders for the dogs and horses. We soon found ourselves on horseback (Clarkson's horse was a mule) en route to the field of our day's sport.

Our party consisted of the Captain, M. P. Clarkson, the writer, and John Haynes, a man who had charge of the hounds, and who usually cared for them. Each was armed with a double-barreled muzzleloading gun, loaded with buckshot. The one the writer carried was a small, short gun, which he thought rather light to kill a deer. It was loaded with twelve buckshot in each barrel. The other guns being larger were loaded with more shot. The dogs form an important part of a Kentucky hunt.

At the sound of the horns—large ox horns hung under the shoulder—the dogs, Old Rules, Munch, Dayton and Modoc, by their whining and low joyous barks showed their eagerness for the start. Old Rules, Munch and Dayton are among the first dogs in the State, and run very closely together, Rules giving the most "tongue," Munch the best trailer, and Dayton's exciting voice being enough to stir the heart of the most indifferent sportsman. Modoc was youug, long-legged, built on the greyhound order, and without reputation, but he showed such speed that the Captain feared, and it actually proved true during the day, that he would lose us some good sport. But Mr. Haynes said he was a good trailer, and as we had come a "right smart" way from the hotel, we concluded to keep Modoc in the pack and take our chances.

After leaving the hotel we rode along Rock Creek Bottom on what appeared to be a cow-path, in a northerly direction about three miles, passing two or three small clearings where tobacco had been raised the past season, and was now hung in large sheds prepared for that purpose. Here we came to a clearing, and a little in advance of us one or two men seemed to be building a log house. From this point to the northwest the forest had been blown down by the wind, and it was here Mr. Clarkson and the Captain said we should be sure to "jump" a deer. Mr. Clarkson and Haynes were to proceed leisurely along to the west and north for about a mile and a half, the country being very level where they were to commence the "drive." The Captain was to go with me directly north until we came to the north side of a cleared tobacco field, which lay on the right-hand side of us, and hitch our horses by the fence of this field.

This being done, the Captain showed me a strip of woods about forty rods wide, that intervened between the tobacco field already mentioned and another tobacco field still further north; away to the east of us, for fifteen miles, the forest extended to Nolin River. The Captain said that should a deer be started or "jumped" to the west of us, it would quite likely go through this narrow pass of forest into the big wood to the east, unless we should be lucky enough to put a stop to its further career. At an old oak, about ten rods north from where the horses stood, the Captain, after looking closely over the ground, said: "I think this a good stand. Keep well behind the tree, and if a deer should pass and neither of us should kill him, be sure to whip off the dogs, for if they pass here and go into the big woods we shall not be able to make another drive to-day." Upon saying which he walked on north over a little rise of ground some ten or fifteen rods away, just out of my sight, where he chose for himself a stand. This had all taken forty or fifty minutes, perhaps. I had scraped the leaves away from the roots of my tree, so that I could move noiselessly, when away to the west of us, but rather indistinctly, the voice of the hounds is heard. The wind is blowing from the west and the sound is driven along; now loud, now low, and two or three times our hearts sink as we feel sure that the deer has taken another direction than toward our stands, when all at once the woods within half a mile to the west of us seem just woke up by the exciting voice of Dayton and the loud cries of his companions.

One to enjoy this music and feel the excitement should stand where the writer did, expecting each moment to see a deer plunge out of the forest, hoping to get a shot as it passsed. But this enjoyment—which from one's impatience amounts to almost torture—is of short duration, for I had hardly drawn up the hammers to my gun when I heard a sharp crack, crack, among the leaves to the west of me, and peeking out from my stand I saw a fine buck jumping along at a rapid rate and coming almost toward me, perhaps twenty rods away. His motions were so graceful, and he carried his long horns so skillfully among the thick underbrush, that I forgot for a moment to take my head out of sight; but that moment had been sufficient to show the buck my whereabouts, for he changed his course so that he would pass me

at a point about ten rods north, going almost midway between the Captain and myself.

Just opposite me was an open space, about ten feet wide, with no underbrush. I brought my gun to my shoulder covering this opening, calculating as he passed to fire, and very quick work it was, for before one could count ten, from the moment he came in sight, I had a bead on him—right behind the fore shoulder, as they had told me—and pulled trigger. Seeing no effect from my shot, except a slight wheel northerly, I sent the other charge after him and had the mortification of seeing him keep his course for one hundred feet or more, when whang! whang! went the Captain's gun, and the deer, without showing signs of being hurt, within the next fifty feet, passed over a little ridge out of my sight. I now thought of what the Captain had said about whipping off the dogs, so that we might make another drive, but was so vexed at not getting the deer that I felt like winding my gun around the first convenient tree. To be sure, ten rods was a fair distance, but I had hoped that buckshot would carry that distance, and I had no apology for letting the deer pass. While choking down my chagrin and loading my gun, the Captain had busied himself in whipping off the dogs, Modoc first, he being only one hundred yards behind the deer, running with a sharp bark, and the balance of the pack coming up within ten or twenty seconds.

I had noticed that the dogs when they came up to where the deer first seemed to change his course, kept straight along. Upon seeing which the Captain immediately jumped before them and stopped them, when he called out to me to come up there. I walked along far enough to see over the rise of ground, when there at the Captain's feet lay the deer. In an instant I was at his side, and a glance showed me that my shot had taken effect at the point I aimed it, but fearful that the Captain's shot had had something to do with bringing down the deer, I said: "Captain, who killed him, you or I?" He said: "I don't know. You have hit him on your side, turn him over and see if I've left any marks." I immediately turned him over, but found not even a scratch; only three shots had hit him and these were from my gun. After this discovery was made the Captain and myself indulged in a hearty hand shake and I am sure he enjoyed my success more than if he had killed a dozen bucks.

About this moment Clarkson came plunging through the wood on his gray mule, and his first question was: "Who killed the deer?" After being told he hastily dismounted and asked for my knife, with which he proceeded to open a vein in the buck's neck, and then congratulated me on my success. We then followed back the trail by the blood and found that the blood began to flow after about two jumps from where the deer was when first shot. The Captain's charge of buckshot was found snugly buried in a sapling, so the question as to who had done the deed was settled

Haynes now came riding in, in response to the horn sounded by Clarkson, and we were all together again, hounds, horses and men. A sapling was quickly bent, and after his entrails had been removed the buck's head was placed in a crotch and the carcass was elevated beyond the danger of dogs, there to hang until our day's sport was over.

But before this was completed the voices of Munch and Modoc were heard to the east of us in the big wood, they having slipped away while we were busy. The other two dogs were tied. The Captain said to Mr. Clarkson that another deer must have passed here some time before, as the dogs kept straight along after this one had left the runway. The track was so fresh and the dogs so excited that the effect of the horn was lost on them, and they were making good time in an easterly direction. The word to mount was given, and like the wind the Captain's horse was off, I riding directly in the rear. And now the excited horses went at a sharp, running gait through the wood, now a cow path, now no path at all. "Anything to keep within hearing, and, if possible, head off the dogs," were the words of the Captain as he looked over his shoulder at the writer, who was using his best efforts to clear the saplings and overhanging branches as his horse, with the excitement of a race-horse, dashed in the direction of the hounds. I have never seen well-broken saddle-horses except in Kentucky. These horses are governed almost by a motion from their riders, the least movement of the bridle rein being sufficient to turn the course right or left, as the rider desires.

A ride of six miles brought us to a point where we were ahead of the dogs, and the Captain placed me at the edge of an old clearing in a clump or a thicket of bushes, and he himself put spurs to his horse and made for another stand, some six miles below where the deer would pass if they went by me.

But my stand proved to be a poor one in this instance, for when within one hundred rods of it, the dogs suddenly wheeled and their music soon told me that they had gone far to the west. Five minutes elapsed and I had lost sound of them entirely and found myself alone amid perfect solitude. After waiting some two hours I was gladdened by the appearance of Clarkson and Haynes, with the other two dogs, coming from an easterly direction through the thick undergrowth. They soon joined me and Clarkson directed Haynes to go and make a drive in the woods south and west of us while we would ride around to Skagg's runway and try another stand, if Haynes should succeed in jumping another deer. A fifty-minute gallop brought us to the point desired, and hastily hitching one horse in a thicket, Clarkson placed me behind an old oak, where, should a deer, approach from behind the hill to the north of us, he must pass within range of me, or of another point just west of me, where he took a stand himself.

We had not long to wait to hear from the dogs, as almost immediately away in the distance, Old Ruler's and Dayton's voices were plainly heard, and we knew they had jumped another deer. About this time the Captain rode up, having failed to get a shot, although reaching two stands ahead of Modoc and Munch, who were running a fine doe toward Nolin River. While sitting upon his horse listening to the dogs, the Captain exclaimed: "There comes a turkey!" and looking in the direction in which he pointed, I saw a large turkey just lighting in the thicket, and immediately fired at her, when she went limping through the brush toward Clarkson's position. The next instant I heard a cap snap; Clarkson's gun had missed fire, and the turkey had escaped us, and his indignation can better be imagined than described.

But this little turn in affairs had finished our deer drive for that day, for the sound of our guns had changed the course of the deer, which was making its way to our runway, and the voices of the dogs were growing faint in an opposite direction.

As the day was far spent, we turned our horses' heads homeward. When we reached the place where our deer was left, Mr. Clarkson took it on his horse, resting its head and horns over his knee, and packed it back to the hotel, which we reached before sundown.

Many stories of deer hunts in that locality were recounted that evening around the huge log fire, and the writer was made the hero of the occasion. B. B. Seaman.

BATTERY-SHOOTING.

Editor Forest and Stream:

My experience has been confined to the Susquehanna Flats about Havre de Grace, and has extended over a period of nearly ten years, although I myself have only shot from a battery for the last four years, since I have been driven to that method of shooting by the purchase by a gentleman for his own use of a point some friends and I had previously rented. I confess that I do not like battery as well as point or bar-shooting. I cannot imagine any man preferring to be all day in a cold, narrow box, with the sun shining in his eyes and blistering his nose one hour, and the water trickling down his back the next, to sitting in a comfortable blind, where he can stretch his legs and stamp his feet. Nor can I see what pleasure there can be in having a snow squall pelt you in the face, nor do I enjoy the excitement of sitting upon the foot of the box and baling out the water, or of throwing the iron decoys overboard to keep afloat while the scow runs down before a squall to rescue you.

I am not as hardy as "Sinkbox," and have never attempted to "wind" more than a couple of dozen decoys, for I have always found that number quite enough to make my arm and back ache, and my fingers as stiff and cold as icicles. I must say that I like to have some one else put out and take up the box and the two or three hundred decoys, and I like to have a good supper and a hot cup of coffee, not to speak of anything stronger, as soon as I get out of the box. I suppose it is for that reason that I have found the amusement quite as expensive as the renting of a first-class point.

Sinkbox-shooting, as practiced at Havre de Grace, requires a considerable outlay of capital in the first instance, and a large expense to keep it going. In the first place you must have a sloop-rigged scow forty or fifty feet long, with accommodations for a crew of at least three men besides the shooters, a sinkbox and from three to five hundred decoys. Then you have wages and and running expenses; in fact, you are running a small yacht and keeping her in commission for a long season. If you hire you are obliged to pay exorbitant prices, and are often unable to hire a boat at any price in the beginning of the season when the best shooting is to be had.

On the broad waters of the Chesapeake it is not safe to trust yourself with anything less than a good sized and able boat as a tender to your box. I have many a time thrown a line to a bushwacker as he drifted by and hauled him aboard, when he was unable to row to windward, and when boarding some friendly scow seemed to be his only salvation. Besides all this expense I have mentioned you have to obtain a license for each sinkbox, which costs twenty dollars.

This large expense is a check to the increase of box boats about Havre de Grace, and there are now not more than fourteen sinkboxes in the neighborhood of Havre de Grace. Still there are too many, and I imagine if some of them were to strike upon snags and end their careers they would not get much sympathy from the remainder.

As far as my observation goes the box-shooting, and what to my mind is far worse, the bushwacking, have made very little impression upon the numbers of the ducks. They come to their feeding grounds in countless numbers, and when the feed is good, linger about them for weeks. And it seems to me that since big-gun shooting at night has been put a stop to by the energetic action of the Baltimore clubs, the ducks have increased in numbers.

I believe, however, the number of ducks at Havre de Grace depends upon the condition of the feed. When the celery grows thick on the bottom of the bay, ducks are plentiful and stick to their favorite feeding grounds in spite of boxes and bushwackers. When the celery crop fails, the ducks seek other fields and pastures new. This seems to me to be the principal reason for the varying numbers of the ducks from year to year, although doubtless favorable or unfavorable nesting seasons affect their numbers. I am sure that the amount of feed makes a great difference on the marshes of the West, where the ducks are not much disturbed, and I do not see why it should not have the same effect at other places.

I believe, however, that the gunners often think that ducks are scarce, although there are plenty of them about, when they are unable to kill many on account of the unfavorable weather.

I do not believe that box-shooting every other day on such a broad expanse of feeding ground as the upper Chesapeake drives the birds permanently away from their feeding grounds.

There are always places in the deep water where they can sit in safety unless it is very rough, and on calm days the ducks sit all day on the shallow spots where no boat can follow them, often within half a mile of a box without giving a shot. Then they have the close days, which they seem to know perfectly well, when they spread all over the flats and feed without molestation, and besides that, a sink box is such a tender thing, so dependent upon the weather, that nature adds many close days and parts of days taken from the lawful shooting days. For to have any success with a sinkbox you must have a moderate breeze, and yet if it blow a little harder you have to take up your box. Then late in the winter and spring, if the river is high and a strong current is running, there are only a few places where you can set out your box, for the current runs your head wings under and your box is apt to take a dive toward the bottom.

On other days the ice runs so that you have to be continually shoving it off with a boat hook, and it makes your box so conspicuous that the trained duck of the Chesapeake keeps at a safe distance.

Almost any day you can see "ricks" of ducks sitting in black masses on the flats, occasionally rising with a noise like thunder or bobbing up and down as they dive for the succulent celery. But you will find that for the most part you get but little shooting except in the early morning, and then the greater part of your bag will consist of blackheads (the local name for broadbills), while the lordly canvasbacks and even the foolish redheads sail high over your box and crook their necks to look down at you, or carefully skirt your decoys just out of gunshot.

For my part, I believe that bushwhacking does far more harm than shooting from sinkboxes. In the first place, there are five bushwhackers to one box, and then, unless ducks are flying in large numbers and very low, it is more deadly. As I believe it is a local method of duck shooting, I will describe it, although I trust I may not be the means of introducing it to other waters. The shooters row out in a small boat to the feeding grounds, and after putting out about fifty decoys, anchor their boat a quarter of a mile to windward of them. When the canvasbacks come flying by they are very apt, attracted by the decoys and the call of the gunner, to circle about and light among the decoys. Then the excitement is at its height, the man in the stern grasps his scull oar and works away for dear life, taking care to keep the boat steady and not to let her wobble. The man in the bow has a white cap on and peers through two holes in the canvas curtain on the bow of the boat, which hides him from the ducks. The boat comes nearer and nearer the decoys, and at last he can distinguish the live ducks swimming around or among the wooden decoys. When they are about to fly he gives them one barrel in the water and he and his mate, if the latter has breath enough left, each give them one as they get up. In this way the natives get from ten to twenty canvasbacks a day to a boat, and as this is about the only thing they can or will do in winter, and as canvasback ducks are often worth from two to three dollars a pair, the flats swarm with bushwackers. The bushwackers are a perfect nuisance to the box-gunners, are always in the way and are forever banging away just as some ducks are darting to your stool and you are counting on a brace more to the good.

The market gunners, who are out in their bushwhack boats every gunning day, and are able to shoot where no box can live, and go to places where no box can "set," kill ten times as many ducks and make forty times as much noise as all the batteries that ever floated on the waters of the Chesapeake, from the time they were first invented to this present writing.

I find on looking at my game book that the last nine days I shot at Havre de Grace, most of the time in a double battery, we killed to two guns 327 ducks, of which about two-thirds were blackheads and one-third redheads and canvasbacks; that the last nine days I shot on Lake Erie, from a point belonging to a club of which I am fortunate enough to be a member, I killed to my own gun 247 ducks, more than half of them large ducks—canvasbacks, redheads, mallards, etc.

The best day in the box was 150 birds—104 blackheads and 46 redheads; while the best day on a point was 55 redheads to my own gun. In the box I shot with a friend who is one of the best amateur shots in a box that I have ever seen; and the day we got 150 we would probably have had 200 had not at least 75 of our shells missed fire. Still, this does not seem to me to indicate that a battery is such a very deadly machine, for all the time I was shooting at Havre de Grace there were plenty of ducks about the bay. The fact is that a battery is only effective during the first week of the season. After that the ducks, although they are not driven away, become trained to it, and the great majority recognize it as soon as they see it, and keep at a safe distance.

I will venture to say that if the record of other boats at Havre de Grace were examined, few, if any, would be found to have killed many more ducks than we did, and it seems to me that the killing of three of four thousand ducks in a season can have very little effect upon their numbers, and the thousands and thousands of ducks that feed upon the Susquehanna flats and that can be seen there any day, show that the sneakboxes do not drive them away from their feeding grounds when the shooting is limited to three days in the week. Unless shooting from sinkboxes or bushwack boats were allowed there would be practically no shooting at Havre de Grace. There are not more than a dozen points about that part of the bay, and if there was nothing to stir up the ducks gunners would seldom have any shooting from those points except when it blew a gale. It is notorious that the shooting in Brush River and Gunpowder is better on the days when there is shooting upon the flats to move the birds. If there were no shooting on the flats the ducks would feed there all the season out of reach of everybody and only a few stragglers would be killed along the shore, so that it seems to me that it is to everybody's interest to have sinkbox-shooting prosper on the broad waters of the Chesapeake.

Ten-Bore.

SOME REMARKABLE SHOTS.

Editor Forest and Stream:

Three weeks ago, Don S., the night operator at this place, accompanied by his two friends Hal and Nate, shouldered Flobert rifles and went down to the slaughter house to shoot rats. They had killed several of the varmints and were ready to start home, when Don thought he saw one looking out from under a hog pen. He motioned the others to keep silent and he crept up, took deliberate aim and fired. At the crack of the rifle a pig that had been lying on the other side of the pen jumped up with a snort, went squealing around, twisting his tail as though his life depended on it. The boys looked surprised and Don faintly asked "What ails that hog?" Hal said it was shot. On examination they saw it was true, and would have to be killed. Don called a butcher to dress it, and says he will give the boys anything if they will stop grunting every time they meet him.

Athens, Pa. Park.

Editor Forest and Stream:

The most remarkable shot I ever saw was made by a young fellow who was hunting geese. He crawled a hundred yards or more through the grass and fired both barrels of his gun into a bunch of decoys, thinking they were live geese. When he fired, the boys who were lying in the grass watching him gave a shout, and you could have knocked him down with a straw. It made him so nervous that he couldn't hit another goose that day, although he had at least a dozen good shots. A. W. S.

Editor Forest and Stream:

Among the remarkable shots which should have a place in the columns of your paper is a certain little episode interwoven with the account of a field day in England, as related in "Pickwick," where, after describing Mr. Winkle's interesting maneuvers with the gun, the author says: "Mr. Tupman's mode of proceeding evinced far more of prudence and deliberation than Mr. Winkle's. His process, like many of our most sublime discoveries, was extremely simple. With the quickness and penetration of a man of genius he had at once observed that the two great points to be attained were—first, to discharge his piece without injury to himself, and, secondly, to do so without danger to the bystanders; obviously the best thing to do, after surmounting the difficulty of firing at all, was to shut his eyes firmly and fire into the air. On one occasion, after performing this feat, Mr. Tupman, on opening his eyes, beheld a plump partridge

in the act of falling wounded to the ground. He was on the point of congratulating Mr. Wardle on his invariable success, when that gentleman advanced toward him and grasped him warmly by the hand. 'Tupman,' said the old gentleman, 'you singled out that particular bird.' 'No,' said Mr. Tupman, 'no.' 'You did,' said Wardle. 'I saw you do it—I observed you pick him out—I noticed you as you raised your piece to take aim; and I will say this, that the best shot in existence could not have done it more beautifully. You are an older hand at this than I thought you, Tupman; you have been out before.' It was in vain for Mr. Tupman to protest, with a smile of self-denial, that he never had. The very smile was taken as an evidence to the contrary; and from that time forth his reputation was established. It is not the only reputation that has been acquired as easily, nor are such fortunate circumstances confined to partridge shooting."

SEYMOUR VAN SANTVOORD.

TROY, N. Y.

A GAME PROTECTOR'S SUGGESTIONS.

Editor Forest and Stream:

Below I offer a few suggestions as to the changes which should be made in our game laws in order to make them more intelligible, and to facilitate the work of the protectors.

In the first place the law for the protection of fish should be separated from that of game. If there is anything objectionable in an act prepared for the protection of fish, and it should not pass, as has often happened, then that with reference to game is lost and *vice versa*.

The menhaden fishing is of such vast importance that it is a question worthy of consideration whether it can in any, and if in any, in what, localities be restricted. As it is the fishing interests in food fish are very much injured by the menhaden fishing. Then, too, the pound is a very destructive engine, and is destroying the fish in many localities, yet it is legal in almost every part of the State. Again, would it be well for the State to interfere with the steamers off the south side of Long Island coast and keep them outside of the State limits? It has been stated these steamers catch no more good fish than what they use on their boats as food for their crews, but this is certainly not always the case. Besides these matters there are several others of importance which should be attended to, but whatever is done the act should be so explicit and definite that those whose duty it is to enforce it can be sure of their ground. There is also the question as to the time during which fish should be caught. A knowledge of the time of spawning of fish can only decide this.

On Long Island, thirty years ago, there were deer from the east end of the island into Queens county. After the railway was built, the deer opposite Patchogue and that district seemed to shift their quarters, and they were seldom seen on the south side of the railroad. Smith Town, Setauket, Port Jefferson, Miller's Place, Wading River, and from thence to Riverhead were well stocked with deer, and the region to the west of Smith Town, and from Riverhead to Good Ground was a favorite place for them. The hunting of deer with hounds for long periods in each year has almost been the means of their extinction, and there would not today be a single deer on Long Island but for the fact that about Islip a few were left over through the South Side Club preserves. Besides this, the South Side Club have been liberal and progressive enough to turn out some. What saved the deer to the present time, however, was the law obtained by that club forbidding the killing of deer for five years. There are now a good number of deer, but confined quite to a small territory, and they are increasing rapidly.

A very few deer are found as far to the east as Lakeland and some a little to the west of Islip. From an oversight, after restricting the law for five years nothing was done about protecting them any longer, and so this year the killing of deer came under the general law, and they could be killed from first of August to the first of December. Had the hunters known this there would hardly be a deer left now. The people of Long Island were under the impression that deer could be hunted only from the first to the fifteenth of November, and then with dogs. They of course were disappointed when they found they could not use dogs in November, and when they also ascertained afterward, that the season was open to the first of December instead of the fifteenth of November. It is well the deer escaped destruction by this misunderstanding, and it will be well to get such a law passed this year as will not leave the same chance of destruction open in the future. I would suggest as a general outline a law of this kind: That no deer be killed in Queens and Suffolk counties for three years from the passing of this act; that after the expiration of the said three years, deer may be killed for one week in October of each year; but no dogs should be used. Such a law would give every man a chance to obtain venison when the time comes, and the prohibiting the use of dogs of all kinds would protect the deer, so that they would not greatly diminish in number.

It is simply a question of time when there will be but few deer to the northwest of New York State. The population is increasing, and the rising generation are being taught that it is more healthful for the youth to use the gun and exercise than to lounge round the saloons in New York and elsewhere. Consequently, where there is one gun now there will soon be several; therefore, take the preservation of deer in time. Prohibit using dogs, and if not altogether, for a time; and shorten the period of killing deer, and the whole community will be benefitted. The open season for dogs (if any) should be when the weather is cool, and the deer can be transported to New York city or elsewhere, instead of being thrown away.

With reference to ducks, geese, etc. Battery-shooting should be at once put a stop to, and a law passed giving officers power to seize nets with ducks in them, and making the law very severe for fire-lighting ducks and geese: changing the law for commencing duck shooting to the first of September, instead of the first of October; limiting the shooting in the spring to the first of April. This would give the gunners an opportunity of killing teal and widgeon, which leave early in September, and the black duck and others a chance to breed in the spring, whereas now they are driven away, as they mate before the first of May.

The law as to woodcock, partridge, quail and rabbit, should be amended by restricting the killing of woodcock to the time when partridge shooting commences. Partridge shooting should commence at the same time as quail shooting, this would carry out the law to protect the game; and shooting should end not later than the 24th December so as to save birds from wholesale destruction which results from their being killed in the snow. As it now stands it gives parties an opportunity to violate the law by pretending to hunt for woodcock, and in reality hunting for woodcock, partridge and quail, and it makes it very difficult to detect such parties. That a person is seen with a dog and gun in the open air in the close season should be *prima facie* evidence to convict.

No birds of any kind should be allowed to be killed during the breeding season. The shooting of blackbirds gives the shooters a chance to killing songbirds. It is a question if blackbirds do not do more good than harm. In the spring they can be seen by hundreds following the plough, eating the worms that have of late years been so destructive to the crops.

Taxidermists should not be allowed to kill or have killed, during the breeding season, any birds for specimens. It was known that numbers of woodcock were killed on Long Island and Staten Island at such times as they had young, and some of them sent to a taxidermist, whether to eat or set up cannot be known. It is an outrage to kill birds when they have young, thus leaving them to starve.

The Supervisors have the power, in a great measure, to change the game laws. A law was passed April 25, 1884, enabling them to prohibit hunting or fishing in particular localities for limited periods.

The sportsmen's clubs should depute some one or more of their prominent members to meet the Supervisors of their county before applying to the Legislature for aid. If it is shown to the Supervisors that they can legally and fairly make such changes as will be beneficial, they are likely to do so.

Game protectors should have power to appoint deputies in special cases. This would enable them, whenever they learned of an infringement of the law, to appoint some person on the spot who could look after the case and get the evidence. It is apparent some such law is required; and they should also have power to inspect and open boxes on suspicion, to declare certain marks on birds as sufficient evidence of their having been snared, and to arrest hunters found hunting with a gun and dog out of season. This arrest can only take place if partridge, woodcock, quail and rabbit shooting commence and end at the same time.

The Supervisors, by Section 35, have power to raise by tax $1,000 in aid of the enforcement of the provisions of the game law. Then there is the dog tax, the surplus of which, after paying for the sheep destroyed, should be paid over for this purpose, and not carried to the commissioners' account of highways, as was done in the town of Southampton last year. There are still other ways of forming a fund to pay any deputies the game protector may appoint to perform particular acts, without in any way increasing the tax of the taxpayers of the county.

Now, Mr. Editor, I have only given some points that may be useful to parties framing the laws. Should some such power be given the game protector as above indicated, the game and fish laws can be enforced. It is now next to impossible to obtain evidence, as no one will come forward and give it.

G. W. W.

DEER IN THE ADIRONDACKS.

The petitions for non-hounding law should be sent to us immediately.

FROM the State Game Protectors' reports to Commissioner Richard U. Sherman, we take the following passages in reference to the deer of the Adirondacks. Peter A. Leonard, of the Seventh District, including St. Lawrence and Jefferson counties, says:

"The deer in my district have diminished in numbers since my term of office commenced. With the continuance of all the modes of destruction at any time hitherto practiced, it cannot be expected, truthfully, that deer have not diminished in numbers. To the limited extent to which restraint upon destruction has been retarded, and this, too, to a gratifying extent. But for the efforts made for protection, it is certain that St. Lawrence county would have been the scene of destruction to double or treble the extent actually the fact. Relatively to other counties, results of protection efforts in St. Lawrence are believed to be the most favorable. While it is certain that the early slaughter of deer—in May, June and July—is carried on beyond the possibility of detection to a large extent in the several forest districts of the Adirondacks, the prohibition of dogging deer in St. Lawrence has made protection in St. Lawrence possible to an extent impossible elsewhere.

"Organized bands with scores of dogs dare not commit depredations in St. Lawrence county. When we shall be able effectually to suppress dogging by local offenders, watching time and opportunity to violate the law with impunity, deer will multiply in St. Lawrence rapidly. I state this as the result of an experience of twenty-five years in our forests with rod and gun, in every season of the year.

"In the winter months, in St. Lawrence, I am not informed of crust-hunting having been practiced recently.

"In Franklin county the information that I receive is that crust-hunting is practiced to a considerable extent. In June and July hunting by 'jack light' is practiced in both counties, but most extensively in Franklin, for reasons which will suggest themselves.

"Hunting by jack-light in the open season may be permitted without danger of exterminating deer. Please observe that I repeat the words of your inquiry, 'open season.' While as a method it is objectionable, its results are not so much so. In the open season the facilities for destruction by 'jack' are comparatively limited and its success indifferent.

"Dogging deer, as a method and in its results, is a sure means of extermination. Its prohibition is essential to the protection of game, and, in my judgment, not a single reason can be given for its toleration that does not relate to personal indulgence in reckless, wanton and indiscriminate harm or destruction to the game. Where it is tolerated, in my judgment, game protection, in its true meaning, is impossible.

"In my judgment, having reference to game protection as a means of multiplication, I would prohibit every method of hunting except still-hunting and jacking—confining still-hunting to Aug. 15 to Dec. 1, and jacking to Aug. 15 to Sept. 15."

Game Protector N. C. Phelps, whose district includes Herkimer and portions of Lewis and Oneida counties, says:

"If there be no deer killed until Sept. 15, and then only by still-hunting, they would be so plenty that a person could easily get one in less than an hour by watching any runway. Venison thus obtained would be far superior to the flesh of the deer which has been pursued by dogs. In my opinion all the dogs should be taken from the Adirondack region, and the open season should be limited to the time from Sept. 15 to Dec. 15."

Southside Signal: We are heart and hand with this endeavor, but are clearly of the opinion that Suffolk county should be included in the scope of the act. Deer hounding is cruel, and ought to be suppressed.

LONG ISLAND.—Manorville.—I note with pleasure the remark of Mr. French that quail flourish everywhere, and in some sections are so abundant as to be a nuisance. I would like to know where a few of those places are. Quail have been quite plenty around here, with a goodly number left over. Partride not as plenty as in 1883, and thanks to a little exertion, but a few snared. Why should the open season on partridge begin on September 1? Far better be the same as for quail. On woodcock we are counted out, as we have no fall shooting.—C.

NEW GAME ASSOCIATION.—A party of gentlemen from this city, among them Abram Garside and Hugh McRoberts, have purchased some 17,000 acres of land near Port Jervis, on which they propose to erect six large cottages, a club house and stables, and otherwise improve the property, transforming it into a game preserve and a summer resort for the members. It is also proposed to improve the large pond which is included in the tract purchased and stock it with fish.

Sea and River Fishing.

TROUTING ON THE BIGOSH.

IN THE WOODS.

A BRISK little stream ran across the trail and Jack proposed to follow it down to where it found its end, either in the lake where we fished last year, or in the Bigosh itself. The boy was full of all kinds of schemes to do unusual things, merely because they were out of the general routine, without regard to the labor or the discomfort involved. In this he was a true boy and often reminded me of a similar propensity in a boy of forty years ago, but I did not enter into these projects with the enthusiasm that he did, and preferred the beaten track to the tangled thickets and fallen logs, so I agreed to follow the stream for a little distance to see if a trout pool might lie in its course. The traveling was rather better than we expected, because the briers were few and so were the logs. In the wilderness the briers are only found where the fires have run through and killed the timber which shades the ground, and luckily we did not get into either a "fire slash" nor a "wind slash," therefore it is recorded above that the traveling was better than we expected.

It was near noon and over a mile down the stream had been made within an hour, by crossing and recrossing the water as one bank or the other promised better walking, when we came to a place where a big cedar log lay with its upper surface just above the water, which had scooped a passage beneath it in the soft earth. It was the place for a trout to lie if there was one in the stream, and if there were no impassable falls below it was certain that some fish would run up and stop in such an inviting place. A trout dearly loves the protection of a log, a bush, or a bridge, which protects it from enemies above, and from whence it can see without being seen and can dart out and seize anything coming down stream. I pointed out the hole to Jack and told him to step lightly so that any fish lying there would not be alarmed, and we would see what might be under the log. As might be expected, Jack immediately proposed to capture any trout that might occupy the fortress. All talk about our not needing trout and the sinfulness of taking life without the excuse of food supply was lost on Jack. He did not care anything about ethics; there might be a trout under that log, and if so he wanted him.

Just suppose for a moment that you are an angler near the meridian of life and in charge of a large-hearted impetuous boy of fifteen, and are trying to instil correct principles regarding the legitimate capture of game fish and of self-restraint when the temptation of an opportunity to kill more than you can use occurs. What can you say to the son of your friend when he says: "I don't care anything about that, but if there is a big trout under that log I want him." The chances are that you would be in stronger sympathy with the boy than with your own notions of angling propriety. Notwithstanding the fact that I had firm convictions on the subject of killing for the mere sake of killing, I liked Jack all the better for his opposition to my precepts. He saw that the overhanging bushes would not admit of fly-casting and started to find a grub under the loose bark of a pine log when I called him back and said: "Jack, if you are bound to kill that trout, if there is one, do it so that if the fish doesn't respect you for it, you will retain your own good opinion of yourself. Don't murder him with a beastly grub which tempts only his grosser appetite, kill him with a fly."

"But the bushes will not allow me to cast a fly here, there is no room for the line behind, and if there was, then the flies would get fast, hung up to dry in the bushes."

I insisted on his rigging up his leader with one fly, a coachman, and showed him how to drop it on the water by using only ten feet of line and how to keep the fly moving. After a trial or two he caught the trick and as he stood about four yards above the log, which was on his left, he was screened by the bushes. He let the fly drift down near the log and made it dance lightly on the water. A trout rose and missed, another rise and a strike. Jack allowed the fish to reel off some line and in a twinkling it ran under the log, the gut leader parted and the trout went off. He saw his error and vowed to do better next time. Another fly was tied on and another fish struck and led up stream by main force and the landing net did its duty. No place to play a fish there, with limbs of trees above and below and a narrow swift stream to help the trout in its downward rush. He took three from under that log, as nearly alike as trout can be, and each of about five ounces in weight. We found two similar places below and by carefully playing the fly on the water, without any attempt at casting, Jack took five more fish. He was reminded that the day was in its decline and that unless we hastened back to the trail and stepped out lively we would not reach Uncle Ben's before dark. He surprised me by a proposition to camp all night and go on in the morning. I argued in favor of a good supper and a bed at the house, and explained that we were not well prepared to camp.

"That's just the reason I want to camp," said he, "I often hear father and you talk about being caught out and want to know how you do it, so that I can take care of myself, if necessary."

Under these circumstances I gave in to the boy and we looked about for a good spot. We found a large log from one side of which the ground sloped enough to carry off any rain that might fall, we threw up a ridge of earth under it with our knives to stop the water from the hill above, and

made side ditches to carry it away. Spruce branches were cut, the coarse limbs separated, and a bed four feet wide made by beginning at the bottom and laying courses of spruce across it with the stems toward the head, covering the stems with the next layer, as shingles are laid. Poles were cut and laid from the top of the log over the bed and large slabs of loose bark were laid on light sticks crossing the poles. The bed was made and covered in about two hours, and promised protection from dampness below or rain from above. I also showed Jack how to make a simple shelter under a leaning tree when time did not permit such an elaborate edifice as ours.

The trout were cleaned and a fire built; for we had matches in a small vial, and supper was cooked. The fish had their heads on and were held over the coals on sticks stuck in their gills and planted in the ground. Hard tack, canned baked beans, bologna sausage, trout and spring water made our supper and left us the sardines in mustard and the remnants of beans, etc., and two trout for breakfast. These we placed in the creel, suspended by a cord to save it from squirrels, porcupines, and other night prowlers. It took Jack a long time to get to sleep in his novel situation, but when he did drop off he slept soundly. In the morning he said that he never felt better in his life, and as he finished the last thing that was eatable in camp he looked as if he could eat tins and all. We arrived at Uncle Ben's and found the kind old man splitting wood in the dooryard. He did not see us until we spoke and then dropping his axe and holding out both hands, he drew a huge breath and could only ejaculate: "Well, by gosh!" FRED MATHER.

VERMONT FISH TINKERS.

Editor Forest and Stream:

Our Legislature may have been actuated by the best intentions, but it certainly made some queer work in its biennial tinkering of the fish and game laws. For instance, the catching of pike-perch is now prohibited from Feb. 1 to June 15. Now, the spawning of these fish is all done long before the expiration of this close time, and they come into the tributaries of the lake in the latter half of May in fine condition, when for a few weeks they may be taken with worms, live bait and the trolling spoon, and often give the angler fine sport. The best of the fishing is near the first of it, and is generally pretty well gone by at the beginning of the open time as fixed by this new law. Did its framers know nothing of the habits of the fish for whose protection they were legislating, or were they working only for the benefit of fishermen at the north end of the lake? Again, it is now illegal to catch and keep a black bass of less than ten inches in length, under a penalty of $5 for every such fish caught and not immediately returned to the water. A bass of nine and a half or nine and three-quarter inches length will certainly weigh a pound, probably nearer a pound and a half, and is a fish not to be despised either on the hook or on the table, and why should he not be kept if caught?

The protection given to our native sparrows is no longer accorded the English sparrow, which is well; but why is the woodpecker thrust out into the cold along with this pest? Some slanderer must have been telling our lawmakers evil tales of the jolly woodpecker. Whatever harm may be done by some of the species, I am sure that the hairy and the downy woodpeckers should be reckoned among the best friends of the orchardist; and who has ever accused the beautiful yellow-hammer of wrong-doing? Or the greatest of our woodpeckers, the pileated, a shy, woods-haunting fellow, who is almost never seen out of the woods and rarely in them?

With all the tinkering, there was no more effective means provided for enforcing the fish and game laws. For the town fish wardens get nothing for time spent in looking after violators of the laws, and no pay at all unless a lawbreaker is convicted and a fine collected; therefore these officers do but little, though quite as much as could be expected. What we need are salaried State and game constables, but the sum necessary for compensating them for their time is a bugbear too frightful for the Vermont Legislature to face. AWAHSOOSE.

FERRISBURGH, Vt.

BLACK BASS TALK.

Editor Forest and Stream:

Much has been written about casting for trout and salmon and about trout flies. I would like to hear what our black bass anglers have to say about casting for bass, and what flies they use. There are many favored anglers who can afford to tell us how to catch the lordly salmon and the aristocratic trout. We bass fishermen read these articles religiously and enjoy them, though few among us will ever have the pleasure of catching a salmon, unless it be in the bye and bye, when we have reached the happy fishing grounds. I will venture something about black bass with the hope of starting conversation on bass fishing.

The black bass is an honest, hard-working fish, and seeks not high places or cold waters, but is content to plod his way in the lowland rivers, where he is "hail fellow well met" with all the big and little "catties" for miles around. He is democratic in principles and does not seek office, although at times he will bite at tempting offers. His meat is not so delictae as that of the salmon or trout. His shape is not beautiful, neither are his colors brilliant. He does not figure in poetry, or in sentimental novels. As for pet names such as "speckled beauty" and the like, he rejoices not in them. Such are his faults. For his virtues go to the beautiful mountain rivers of West Virginia, and commune with him there, you will find him an entertaining fellow with many admirable traits and surrounded by all the pomp and glory affected by his lordship, the salmon.

If bass fishermen are like trout fishermen, they catch their fish in many ways, and it will be very interesting to know how they cast and what flies they use. It seems that in angling, and in most of the fine arts, and even among fish, there are distinct schools. An artist paints a sunset, and it is to him and his admirers both beautiful and natural. To others it is hideous and impossible. The compositions of Wagner are to many musical ears little less than divine inspirations. To other musicians they are but a succession of harsh and monstrous noises. One fisherman tells us that the flies should be cast sharply on the water. There are many who agree with him, but on the other hand there are as many who think the flies should be cast lightly, and insist on delicacy. Thus say the trout fishermen.

In casting for bass I find, when fishing clear, unbroken water, a delicate cast is very necessary to my success, the majority of fish being caught just as the fly reaches the water. I try to make the fly remain in the air as long as possible, and then drop lightly on the water. In fishing pools and quiet stretches, I depend almost entirely upon the neatness of the cast, and as a rule use but one fly.

On riffles and broken water I use two, and occasionally three flies. I do not like small flies as I rarely catch large fish with them. When large flies are used I would recommend light bodies and hooks. When I say large flies I mean the standard size, as found in the best shops, and not the great fat-bodied ones, as these are very trying to a light rod. When the water is perfectly calm and clear I make an exception in favor of small flies, and use my finest leaders. Like most anglers, I have all kinds and conditions of flies. I will describe two of them which are my favorites. No. 1 has green (dyed mallard) wings, green hackle and yellow body. No. 2, light brown, turkey wings, red hackle and yellow body. My rods are of split bamboo, they weigh 4½ and 8 ounces. The best bass rod I ever owned was made for me by the late Thaddeus Norris, it was made of greenheart with split bamboo tips, and weighed 7½ ounces. After using it for some years it became warped and twisted, and was sadly put on the retired list. E. F.

CHICAGO, Jan. 3.

THE RAGGED LAKE CLUB.

RAGGED LAKE is in the Northern Adirondacks, west of the Chateaugay lakes, and sixteen miles southeast from Malone, Franklin county, N. Y. A club composed of Syracuse gentlemen has bought sixty-five acres of land there which includes three handsome bodies of water, which are well filled with trout, and which they will protect. The Hon. James Geddes is now at the lake preparing to erect five cottages, which will be ready for occupants in May. The officers of the association elected November 19, are:

President, A. C. Belden; Vice-President, James Geddes; Secretary and Treasurer, George S. Hier; Executive Committee, A. C. Belden, James Geddes, H. S. Holden, Fred Frazer, John P. Hier; Trustees, George S. Hier, R. W. Jones, O. C. Potter; Auditor, F. B. Klock.

The list of members, twenty in number, includes the names of Fred Frazer, George S. Hier, Frank P. Denison, R. W. Jones, Geo. P. Hier, John P. Hier, Fred P. Hier, H. S. Holden, A. Ames Howlett, James Geddes, O. C. Potter, George S. Leonard, Frank B. Klock, A. C. Belden, Sylvester Piper, E. P. Bates, Geo. N. Kennedy, E. D. Dickenson and B. S. Aldrich, of Syracuse, and Lucius Moses, of Marcellus.

The following articles, selected from the neatly printed constitution of the club, show the principles upon which the club has its existence:

5. No person or persons, except such as are duly qualified as hereinafter provided, shall be allowed to stay at the club house, or shoot or fish on the property of the club.

10. No person who follows shooting or fishing for market or hire shall be admitted as a member of the club, nor shall any shooting or fishing for market or hire, on the part of members and guests, be permitted at any time.

21. Any member may make application for invitations for persons not members of the club to the President or Secretary-Treasurer, who shall refer such application to a committee of three, to be appointed by the President, and members of said committee to be known only by the President and Secretary-Treasurer. This committee to decide whether or not such invitation shall be allowed. Provided always, that members may invite members of their family, excepting males who have attained their majority.

8. Upon failure of any member to pay an assessment upon his share or shares for the term of four months, such share or shares shall be forfeited and become the property of the club, and be sold at auction at the next ensuing annual meeting, and any surplus arising from such sale shall be paid to the member in default.

VAGARIES OF FLY NOMENCLATURE.

Editor Forest and Stream:

Mr. Holberton, in last FOREST AND STREAM, says that the coachman fly derives its name from its "fancied resemblance to the white rubber cape sometimes worn by coachmen." This, it strikes me, requires more vivid imagination than to simply accept the explanation of the late David Foster, given in the pages of his book, "The Scientific Angler," from which I copy:

"A thorough command of the rod and line is as essential and important as the wielding of the whip in the care of a tandem or four-in-hand drive. We are reminded by this analogy that the most skillful cast we ever knew wielded the whip. We refer to the famous royal coachman, Tom Bosworth. Old Tom had, in the early part of his life, driven three successive English sovereigns, viz., the fourth George, the fourth William, and finally, for a lengthened period, Her Majesty, Queen Victoria. As a successful fisherman, Old Tom, when known to the writer, was unsurpassed. He would often fish in the wake of several rodsters, whose energy would exceed their skill, and would extract not infrequently three times over the weight of fish, by skillfully and carefully casting over the awkward and most unlikely looking spots, which the majority of anglers would rarely dream of trying. A favorite freak of his with the whip was to take the pipe from the teeth of a passing pedestrian by a carefully calculated whirl of the whip, and this aptitude was as remarkably exemplified, for a limited distance, in the use of the rod. Bosworth originated the coachman fly, so much appreciated for night fishing."

In copying the above I am reminded that quite recently a writer in an English fishing journal criticised the use of certain terms which he denominated "angling slang," and expressed gratification that such terms were being eliminated from American angling literature. "Rodster" was one of the objectionable expressions, and as I came across it in Mr. Foster's book, I wondered if it was coined in England or borrowed from his Yankee cousins. A. N. C.

GLENS FALLS, N. Y.

Editor Forest and Stream:

I notice that "White Hackle" calls me out on this question and credits me with flinging the first stone "into the camp of the fly-namers." I do not know that I can add anything to the articles already written on the subject except to acknowledge that there is cause of complaint that there is no system in classifying our flies and no standard that is accepted by all.

I have just gone over and compared the list of names only in Holberton's and Orvis's list without comparing the flies which are called by the same name, as "White Hackle" found great differences there. On Holberton's plate there are sixty-four named flies, and in Orvis's list there are seventy-eight, yet Holberton names thirty-seven which are not in Orvis's, the latter omitting the Montreal and alder flies, and naming forty which Holberton has not. Including hackles I find that only twenty-eight names are used in common by these two authorities. Orvis names brown coffin and also marsh brown, while Holberton gives both names to one fly which has a blue wing and is like the brown coffin of Orvis, the marsh brown of the latter has a brown wing.

I do not pretend to say which is generally the most correct, and write merely to show how the authorities disagree. Under these circumstances I do not wonder that there is confusion in the minds of anglers on the subject of fly nomenclature. "White Hackle" credits me with affecting ignorance of the name of a favorite grayling fly, of which I said that I did not know its name, "owing to a defective memory and the vagaries of fly nomenclature." The ignorance was real, although Mr. Cheney in editing my article kindly put a foot note saying that it was the oak fly, and I know it now.

I do not tie flies, and when I buy them merely pick them out by the combinations of color without attempting to master the fly-tier's entymology and nomenclature. Of course there are some names so well known that every angler recognizes them—such as the coachman, professor, queen of the water and scarlet ibis

If it was a possible thing to have a convention of fly-tiers who would agree on a standard, one name for one fly and one fly for one name, then possibly we could attempt to master the system. If any one has doubts about the confusion of names let him take some fly that is not too well known and ask his angling acquaintances what they call it, or send it to different dealers in fishing tackle for a name.

New flies are continually devised, but we have enough already. Last year Mr. Cheney did me the honor to invent a bass fly, and give it my name. It is not before me now, and I carefully keep it on the card with the name on it, for I have not learned to know it yet, and I may say that I have not heard that the supply of bass has been diminished to any alarming extent by my namesake. Reports say that a few are left for the coming summer. FRED MATHER.

SALT BATH FOR TROUT AND MINNOWS

Editor Forest and Stream:

Some one has said, "a wink is as good as a nod." In the early part of 1884 the nod was given through the columns of FOREST AND STREAM, so I will use the same medium to return the wink, which may be of service to some angler in the same misfortune. Some one (I forget who) of your ichthyologist friends gave their experience and method of treating sickly fish fry to a salt bath, and the good results attained thereby.

For years it has been my custom every summer to put away a supply of minnows and shiners for fall and winter fishing. Last summer I utilized a brook, putting in a small dam and forming a pool two rods long by three feet wide. In the pool I placed three boxes, each end of the boxes covered with wire cloth, eight meshes to the inch. The upper box being in deepest water was intended for any trout too small for table use. The other two boxes were filled with minnows and shiners. Things went on swimmingly in the boxes and out, with a weekly increase to the trout. But "the best laid schemes of mice and men," etc. One of those old-fashioned rain storms we sometimes read about occurred in September, and sent the water rushing from the hills, kicked up Cain and my dam in the little brook, and made a general havoc. Two days later, when at dinner, a neighbor passing the door asked if I was aware that my dam had been carried away and my fish boxes were dry. Reaching the spot I felt faint on lifting the lids of the boxes. The water was about two inches deep, and what bait were not dead were covered with fungi. On raising the lid of the trout box I found that they were all safe, with six inches of water flowing through the box. I repaired the dam as hastily as possible, picked out five dozen dead fish from the two boxes, and was about to throw all out and fill up anew, when the thought of the salt bath occurred to me. I put into the upper end of each box one pound of table salt, so that the water would dissolve it and carry it through and out at the lower end. When I left them every fish was a white, downy mass with head stuck above water. On visiting my patients the next day at noon, I found two dead. The rest showed signs of improvement. I gave each box one pound and a half of salt. Next day at noon I found many of the fish free of fungi, and all improving; no dead fish. Another dose of a pound and a half to each box completed the cure, with no more dead fish. Wink No. 1, with thanks to FOREST AND STREAM. On the first day of October, 1884, I turned loose as nice a box of small trout as one would wish to see, all taken with the fly on barbed hooks. I lost but one trout through the season, and that one jumped out of the box when I had the cover off. Wink No. 2.

If your Paterson, N. J., correspondent of a few weeks ago wishes to save his trout alive when he lifts them from the water, let them lie on the grass until the fish stop flopping and become reconciled to their fate, wet the left hand in the brook, take hold of the fish gently, with the right hand extract the hook; then place the fish in a pail of water ready for the purpose. He will find he will not lose many fish from tooth pulling, if after-treatment is properly attended to, namely, frequent changes of water.

FEB. 2, 1885. THOMAS CHALMERS.

THE FIRST TROUT.—Bear Creek, Wyoming.—*Editor Forest and Stream:* It was a June afternoon long years ago, more than I care to mention, though I was then a "kid" of about thirteen, but with almost a man's strength, and more than most men's endurance. Our party of three men and another boy besides myself reached the lake an hour or so before dark and immediately commenced fishing. There were no boats on the lake and we did our fishing from rafts. It was my confounded good luck to catch the only fish of the evening. Of course it was a speckled trout. It was not a very large one, but it had the effect of increasing my stature and avoirdupois for that evening at least. The good luck attending our week or ten days' stay brought me down from the pinnacle I mounted that late afternoon when I discovered I had not caught the only trout in the lake, but the memory of it is a pleasant one, though the catching was done with a worm.—MILLARD.

THE BEST ROD VARNISH.—*Editor Forest and Stream:* May I, through your columns, ask Mr. H. P. Wells, and any others who know, how to make or where to buy a really good varnish for fishing rods? Some of the rod makers have the secret, but the varnish dealers do not seem to know it. I will be greatly obliged for the information.—M. (Saratoga Springs, N. Y., Feb. 6).

How Water Snakes Catch Fish.—Oswego, N. Y.—*Editor Forest and Stream:* The following leaves no doubt as to whether the common water snake is destructive to fish: While angling for trout in a pond I saw a water snake chasing a fish about five inches in length. The fish, which was on its spawning ground, kept swimming around in a circle, but a little in advance of its pursuer. Finally the snake, with its mouth, caught the fish by the tail. The fish kept its body well ahead of the snake, for it had the use of its fins. After swimming about in this way for some time the snake made its way to the shore and drew the fish out of the water. I killed the snake and liberated the fish.—Doctor.

Black Bass Caught in Winter.—Swedesboro, N. J., Feb. 4.—Three years ago, in November, we put 250 black bass (4 to 6 inches long) in Washington Lake. Several bass have been caught there since. One taken on the 4th of July last weighed, on the scale, 2¼ pounds. Last Saturday, Jan. 28, the miller was fishing for pike through 6-inch ice, and caught a black bass weighing 3 pounds. Dr. Henshall claims that bass are not caught in mid-winter, and as we have all along considered him the authority on the subject, would like to inquire of your readers if it is a common thing to catch them through the ice, and whether Dr. Henshall is wrong.—C. D. L.

Tarpon Springs, Fla., Jan. 29.—Fishing is very good here, both salt and fresh water, sheepshead, channel bass, sea trout, ravallic, skipjack or indy fish, etc. Dr. Ferber and a number of your old subscribers are domiciled here with Mr. and Mrs. Jones, who have not lost their Homosassa reputation in the least in their manner of keeping a first-class sportsmen's resort. Skipjack and sea trout are taken in endless quantities with the fly, in fact, it is impossible to cast with more than one fly at a time, owing to the way the fish use up the flies. This is no Florida story but a fact.—C. B. T.

Substitute for Varnish.—New Haven, Conn.—If hard oil, such as painters use for natural wood finish, was tried in place of varnish, shellac, wax, etc., anglers would find it to their advantage. Also in finishing rods, it is far superior, as it does not crack or chip off, and it does most effectually shed water. It is very elastic, and gives as handsome a finish as could be desired. Any first-class wood filler will accomplish the same result.—Wig Wag.

Fishculture.

TROUT VERSUS CARP.

Editor Forest and Stream:

I see by the number of Forest and Stream just received that my article on "Trout Brooks" in Forest and Stream for the 15th ult. was alluded to in a lecture on "Fishculture as a Pennsylvania Industry," delivered in Harrisburgh before the Pennsylvania Board of Agriculture and the Legislature. The lecturer, as reported in Forest and Stream, "remarked that 'Penn' had presented the only practical solution, which, when duly analyzed and condensed, was simply to leave the streams in a state of nature." He claimed that a strip of brush fifteen feet wide would be necessary for shade and shelter, and that on the stream which I described, this would, with the stream itself, occupy three and seven-elevenths acres. By actual trial this has been found to produce only ten pounds of trout. But if devoted to properly constructed carp ponds it would yield three and a half tons annually of fish second in quality only to trout.

Now as a matter of fact the stream which I alluded to is far from being in its natural condition, and through the greater part of its course has no shade whatever, except from its own banks and the water grass. Originally the stream wandered from side to side of a meadow. Now for the most part, it runs in a straight line in an artificial channel. Three-fourths of all the fish have been taken out of this open part, where is neither tree nor bush. Several of the springs are located in the woods, but the trout have never been found so far up. The stream does flow through a piece of wood just above its mouth, but the fish are all above this part long before the water is too warm for them. There is absolutely no ground occupied, except by the stream itself, which is reduced to the straightest and narrowest limits. The trout brook of the future for our region is far removed from a natural condition. It is almost wholly artificial. Yet the work to be put upon it is just what our farmers are putting upon their streams, with a view on their part solely to economy of land. They are already collecting the spring water in the swamps into underdrains, and leading these into deep ditches which run straight to the larger streams. If beyond this, they will allow the streams to shade themselves by their native grasses, and will keep them free from open ponds, and obstructing dams, the trout, if started, will live, and thrive, and multiply, and cost little, and occupy absolutely no ground.

I do not place much value upon hyhothetical cyphering. If, however, I were to try my hand at it, the result would be as follows: If there were but one such stream to the square mile over a part of our State 100 miles square, here would be produced, at ten pounds to the stream, the large aggregate of 50 tons of brook trout annually. I doubt if an equal amount of carp could be raised more easily or cheaply. Still the possible limit of trout would be soon reached, while the possible production of carp is really unlimited. I have nothing but encouragement to offer to the promoters of carp culture. Where it is undertaken thoroughly and carefully, the results may be all that is claimed for it. But the experience of our neighborhood has indicated that the carp have very little ability to take charge of themselves. They are eaten by other fish, and are easily washed out by freshets. They are also very liable to be stolen by poachers. In consequence of these results I believe that in my neighborhood up to the present time, the closing remarks of my former article are true.

I will add one paragraph upon restocking our depleted waters. Within the last few years, trout have been placed in many of our larger streams. These fish, when the spring came, ran up the smaller brooks, but in the early season there was nothing to tell the trout which stream would shelter him in midsummer and which would compel him to live, or rather die, in water at the temperature of 80 or 90 deg. In this way the greater part of the stocking trout must have perished. It would be much better in such cases to select only those brooks in which the fish have a fair chance of living, and place them in there in the spring, late enough for them to find the water of the larger streams so warm that they will keep to their cooler brook. They will then live and spawn there, and the young fry will surely return to their place of nativity. In this way all of the introduced fish will be effective in producing the new stock. From the original brooks they will slowly spread to other suitable streams.

FIXTURES.

BENCH SHOWS.

March 5, 1885.—World's Exposition Dog Show, New Orleans, La. Entries close Feb. 23. L. F. Whitman, Superintendent.

March 18, 19 and 20, 1885.—Second Annual Show of the New Haven Kennel Club. E. S. Porter, Secretary, New Haven, Conn.

April 7 to 10, 1885.—First Annual Dog Show N. E. Kennel Club, Music Hall, Boston. J. A. Nickerson, Secretary, 159A Tremont street.

April 21, 22 and 23.—Annual Dog Show of the St. Louis Gun Club. W. A. Albright, Secretary, St. Louis, Mo.

April 28, 29, 30 and May 1.—Ninth Annual Dog Show of the Westminster Kennel Club at Madison Square Garden. Entries close April 14. James Mortimer, Superintendent, 48 Broad street, New York.

May 5, 6, 7 and 8, 1885.—Second Annual Dog Show of the Cincinnati Sportsman's Club, Cincinnati, O. W. A. Coster, Superintendent.

May 13, 14 and 15.—Third Annual Dog Show of the Toronto Dog Show Association. W. S. Jackson, Secretary, Toronto, Ont.

A. K. R.—SPECIAL NOTICE.

The American Kennel Register, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **2113.**

THE AMERICAN KENNEL CLUB.

General W. B. Shattuc, acting as secretary of the executive committee of the American Kennel Club at its meeting of January 24, has prepared for publication a report of the proceedings, which appears in this department. Presuming that the committee met at New York it was somewhat startling to notice the absence of the Westminster Kennel Club, one of the two prime movers in the establishment of the new association. This, coupled with the absence of delegates from the New Haven, New England and Philadelphia clubs led to inquiry being made when the surprising fact of the meeting being held at Cincinnati was elicited. Why Cincinnati was selected is not very apparent and still less can it be understood why the whereabouts of the meeting is kept so peculiarly hidden.

It is further stated that certain clubs were represented in person or by proxy, and it is left to the speculation of the reader as to which were the personal representations and which the proxy. Our speculation is as follows: Montreal by proxy, Baltimore by proxy, Cleveland by proxy, Illinois by proxy, Kentucky by Major Taylor, St. Louis by proxy, Cincinnati by General Shattuc. On this point we are open to correction, but pending the receipt of this information we exercise the common right of dealing with probabilities and assume that Major Taylor and General Shattuc met and with proxies formed a quorum.

Before looking at the business, it would be as well to cast a passing glance at the clubs represented and see what they have done in the way of promoting dog shows. The Montreal Club has held three shows, of which the last one, held in 1884, was the only one entitled to any consideration and may be rated as a second-class exhibition; Baltimore Club has neither held nor announced a show; Cleveland Club has held two shows, equal in caliber to Montreal; Illinois Club has never held a show, but announces one for next June; Kentucky Club has neither held nor announced a show; St. Louis Kennel Club is probably a mistake and the St. Louis Gun Club is meant. Their united effort of last year was a most indifferent one, still they have men of experience in the club. The last is the Cincinnati Club, which has yet to hold its first show in May. It is claimed that it is the second show, but it is well known that the show of 1884 was Mr. Lincoln's private venture, and he so stated to us. To summarize, the meeting was made up of three clubs which have held shows and four which have not, and the clubs not represented are the leading clubs in importance, either in point of number of members or as promoters of dog shows. Of the seven clubs represented, we have presumed, in view of the suppression of information on that point, that five were represented by proxies held by the representatives of the other two clubs, Messrs. Shattuc and Taylor.

There were no reports from committees, which is equivalent to saying that since the association was established in October last it has done nothing. No members were elected, that very necessary piece of business being postponed until *a full representation could be had.* This is a strange reason to give, in view of seven clubs being represented and the importance the election of clubs bears upon qualification for the champion classes. Notwithstanding the lack of representation, however, Major Taylor and General Shattuc proceeded to discuss, and "after a full discussion" decided that Major Taylor's interpretation of Rule 8 should stand. This interpretation is as unwarranted as it is surprising, for neither does the wording of the rule bear it out nor was it intended to read in any such way.

When Rule 8 was adopted last October, the gentlemen present knew well enough what the object and intent of the rule was, viz.: That after that date no dog should be permitted it the champion class unless he had won three first prizes at show held by members of the association. The rule says so, and in was meant by those who framed and passed it to say that and nothing else. For some reason not perfectly clear to us, Major Taylor announced, some time ago, that the rule was not meant to apply that way, but that any dog that had hitherto won one first prize should compete in the champion class. In future, we are told, "dogs will be advanced *strictly in accordance with Rules 8 and 9*;" but why the rules are not to be strictly interpreted and enforced right now is something Major Taylor has never explained. There can be but one reason for this breaking down of the rule, and that is, to admit into the champion class some dog or dogs which would be relegated once more to the open class and possibly remain there. If there is no specific object in view, why change the rule? is the question which naturally arises. It is either to benefit some dog, and is therefore special legislation for which there is no license, or else it is for no one's particular benefit, and therefore totally unnecessary, so it is wrong whichever way one looks at it.

That Forest and Stream is not alone in looking at the case in this light is evidenced by the complete repudiation of Major Taylor's rendering of the rule by the New Haven Kennel Club. Mr. E. S. Porter, who acts as secretary of that live organization, is also secretary of the American Kennel Club, and he knows as we do that the rule was meant to apply just as it reads, and further, that it will so apply at the New Haven show next month, which is the first to be held under the new rules. The New England Club has said nothing either way, but if they agree with Mr. Porter and Forest and Stream that the rule was passed with the object of carrying out what the words say shall be done, there is but one thing for them to do, and that is for them to support New Haven.

The American Kennel Club started out under bright auspices, with a mission of much good and benefit to fulfill, but so far the results have been eminently unsatisfactory. It is sincerely hoped that some of the clear heads of the Eastern clubs will come to the rescue and save the association from possible discomfiture.

THE A. K. R. PEDIGREE FEE is 50 cents. The fee must in every instance accompany the entry.

MEETING OF THE A. K. C.

The Executive Committee of the American Kennel Club met Jan. 24. The meeting was called to order by J. M. Taylor, President, and General W. B. Shattuc appointed Secretary.

The following clubs were represented in person or by proxy, viz.: Montreal Kennel Club, Baltimore Kennel Club, Cleveland Bench Show Association, Illinois Kennel Club, Kentucky Kennel Club, St. Louis Kennel Club, Cincinnati Sportsmen's Club and Bench Show Association. The New Haven Kennel Club having authorized the representative of the Westminster Club or in his absence the representative of the New England Kennel Club to cast its vote, neither being present, it was left without representation.

The minutes of the meeting of Oct. 22, 1884, at New York city, were read and approved. The regular order of business according to the by-laws was then taken up. There being no election of officers, the secretary's report and the treasurer's report were read and approved. No reports from committees. It was decided not to take up the election of members until the next meeting, when a full representation could be had. Under head of miscellaneous business, the proper construction of Rules 8 and 9 were then taken up for discussion. After a full consideration, the rules as interpreted by the president and published in the principal sportsmen's papers over his signature, viz.: "All dogs of whatsoever breed that have won a first prize in the open classes at the bench shows of any organization now recognized as a member of the American Kennel Club, should be entered in the Champion class, and all dogs that have won two first prizes in the champion class, regardless of former competition, should be entered in the Extra Champion class. In future winnings dogs will be advanced strictly in accordance with Rules 8 and 9, and no awards will be recognized except those made by members of the A. K. C.," were approved, with the following addition, viz.: that "previous winners of first prizes in the open class shall take advantage of their winning during the year 1885 by entering in the Champion class; if they do not before Jan. 1, 1886, they shall be continued in the open class until their winnings amount to three first prizes."

It was also the unanimous opinion of the meeting, that Rules 8 and 9 of the A. K. C. should only apply to coming shows given under the auspices of members of the association, with the understanding that clubs may avail themselves of the right of Section 33 of Rules and Regulations, in advertising extra champion class or not, as they think proper.

W. B. Shattuc, Acting Sec'y.

CRYSTAL PALACE DOG SHOW.

[From our Regular Correspondent.]

The Kennel Club's twenty-fourth exhibition of sporting and non-sporting dogs was held in the galleries of the Crystal Palace, Sydenham, on Jan. 13, 14, 15 and 16. The total number of entries amounted to 1,624, which is the largest we have attended, although we believe at the Agricultural Hall, Islington, in May, 1863, the entries exceeded this considerably. However, taking the number and quality of the exhibits, we consider this one of the best exhibitions of the kind ever held, if not the best. As we have already said, the show was held in the galleries of the Crystal Palace, and for an exhibition of the sort we consider a more undesirable place could not be selected. The judging was not finished until midday on Wednesday, the 14th. On the first day there were five judging rings. These rings were "here and there" all over the place, and as there was little available space left for the public to see what was going on, and yet so much was going on at the one time, that we, along with the public, had to put up with a private view on the bench in a great many instances. We also noticed a good deal of time lost by an insufficient supply of keepers, as in many cases when one class was judged there was considerable delay before all the dogs competing in the following class were brought into the ring. This was often caused by one dog being benched in one class and competing in another, which really cannot be well avoided so long as dogs are allowed to compete in two classes. The benching, as usual, was in the hands of Messrs. Spratts, whose manager, Mr. Crofts, could be no more attentive or obliging. The disinfectant of Messrs. Jeys was everything that could be desired. So, after taking everything into consideration, the management was a success, the only objectionable thing being the galleries as a place for holding a dog show.

BLOODHOUNDS.

In champion bloodhounds, Nestor, looking remarkably well, won easy. The corresponding bitch class was composed of four good ones, and almost either of them might have won without leaving much room for dissatisfaction. In open dogs, Mr. Nichols was once more in front with another good young hound, with good expression and possessing a good body, legs and feet. Maltravers, second, another good one not so well on his feet and legs as the winner. Duncan, third, had a good many admirers who thought he might have won. There were a pair of very promising puppies shown in this class by Mr. Foster, which no doubt will be heard of again, and we hope they will not suffer from their visit to the Crystal Palace. The winner in the bitch class we consider one of the best out. We did not admire the second prize on account of her white feet. Third prize went to Morgiana; her skull is not equal to the others placed over her.

MASTIFFS.

The class for champion mastiffs, dogs, was well supported, no less than seven entered and all turned up before the judge, whose decision we could not quite follow. Maximilian, the winner, is a good-bodied dog, but not quite large enough in skull for a dog of his size, when compared to others in the class. Orlando looked well; what a pity this dog did not stand up better on his legs; his body and head properties are really something extraordinary. We fancied Crown Prince or Cardinal for the pick, and the latter for choice. There were only two entries in the bitch class, and we quite indorse the decision and think the brindle Lilly II. won well. The open dogs were, as a collection, the worst lot we have seen at the Palace. Goth, the winner, is long in face and seems flat in rib. In fact we considered Prussian Prince as good as any in the class, and he is not of the first rank; nevertheless, he is really good in body and of good type. Ilford Caution is a good fronted dog, but falls off behind. The open bitch class was about the best we have seen, the winner, Cambrian Princess, is a good bitch, possessing both size and quality, yet we did not like the way she moved. Second prize, Queen Ann, is a good stamp but got more than she was entitled to here in our opinion. We fancied her kennel companion as much as her. Dr. Turner's pair, Lady Clare and Lady Isabel, we fancied very much; the former has her ears set on rather high, while the latter we think should either have been first or second. Vivien, hc., was looking well; she has often been reported upon. We could not follow the judge in the bitch puppy class, the second prize being a long way ahead of the first, whose ears were wrong and in face she was also inferior to her sister. Mr. Wade, all the way from Pittsburgh, Pa., we find represented by a daughter of his imported Dina, which in many respects resembles her dam, but possesses, if we recollect right, more bone and substance.

ST. BERNARDS.

In St. Bernard champion dogs, Valentine, still improving, was successful in defeating the well-known Bayard. Closter did not turn up in bitches and Elfrida won, we think looking better than we ever saw her. She was certainly greatly improved on her Edinburgh form. We find Mr. Smith again first in the open dog class with Merchant Prince, second to Valentine at Birmingham. He is a remarkable large young dog, possessing good coat and carries himself well; had he a

little more of Valentine's or Bayard's perfect head he would certainly be a grand dog. However, he is a most difficult dog to get away from and no doubt will be often heard of again. Grip, second prize, we think was lucky. His ears are wrong and consequently his expression is destroyed. Musgrave is a good stamp, but too small. Pilgrim, sire of the well-known Plinlimmon, might have been higher up, while Visp II., although out of form, we fancied very much. Hector IV. is another good dog. He wants a better blaze, and is too straight behind. The bitch class was remarkable for quality. Lady Eva won well, possessing a good head, with the best of feet and legs. Her body is all that could be wished for; had she a little more white up the face her general appearance would be much improved. The well-known brindle and white La Mascotte was a good second. This bitch has a wonderful good head, good body, legs and feet, but falls off a little behind. Maggiore, equal third, another brindle and white, is a good all round bitch. She was looking well. Crevasse II., also equal third, falls away a little before the eyes. Countess of Beaufort we thought did not look as well as when we saw her at Warwick last April. Mr. Thornton won first in smooth dogs with a very good red and white by Leonard, second prize going to a leggy, light-bodied specimen, weak before the eyes. The first and second-prize winners in smooth bitches were both good ones. There were very large entries in the puppy classes, but quality did not turn up accordingly.

NEWFOUNDLANDS.

In champion Newfoundland dogs Nelson I. was all alone; he was looking well. In the open class for dogs, Mr. Nichols turned up first with what we consider the best we have seen, and evidently Mr. Nichols thought so to, for after being well tried, he still refused to offer him at a price. King Bruce, second, was reported upon at Birmingham. In bitches, Lady Teazle won. She is a good stamp, but we don't like the white on her chest and feet. Queen Zoe was unnoticed; rather hard lines, we think.

GREAT DANES.

In champion Great Danes, Sultan II., looking well won, with the black and white Harlequin Nero second. In open dogs, first went to Cedric the Saxon, the winner of the challenge cup last July; second and third prizes were awarded to two brindles. The three winners were grand, noble dogs, and a show in themselves; possessing bone and substance, yet as straight on their legs as greyhounds, with powerful jaws and what teeth! Voorwaarts,vhc., has a grand head with plenty of bone and substance, but not possessing the same amount of quality about the shoulders as those placed over him. The quality of the bitch class was quite equal to the dogs, and we think we can say no more. There was nothing in the dog puppy class that looks like coming to the front. The winning bitch puppy of a blue color promises well.

DEERHOUNDS.

Bevis I. won first in champion deerhounds, a decision we could not indorse. We fancied Chieftain an easy winner. In open dogs, Gunner was rightly placed at the head of the class. We would have put Clansman second with Robin Grey third. In bitches Beatrice won, and we think won well. She is full sister to Chieftain. Heather Belle is also a good specimen, with good color and coat. We noticed a lot of puppies in the deerhound class which, of course, cannot be compared with or stand any chance of winning against matured dogs.

POINTERS.

In champion pointer dogs Graphic again won, and, as usual, was looking well, he had no opponent this time. Glee won in bitches. We still have a great regard for Bow Bells and think her wonderful feet, legs, body, shoulders, and general character something not to be seen every day. However, she is not as light and airy as we have seen her, in which respect the winner beats her. In the open dog class Luck of Hessen, vhc., is leggy and light of body. Gunner, c., is a useful dog not showing enough quality. Duke IV. has his ears set on too high and is weak in muzzle; this dog had a nasty sore on his hindquarter. Paragon, a mere puppy, won; but we think he was fortunate, no doubt we shall see more of him when fully matured. Second went to Don IX., reported upon at Birmingham; in our opinion he should have won here. In bitches, 50 pounds and upward, Flounce of Braunfels, vhc. and reserve, is really a good bitch. Dapper, third, has a good head and neck, but is rather leggy and straight behind. Revel III. is a real good one, we have reported upon her before. Amber II. was very lucky to get so far up in the list, her ears are not properly carried and she was shown in bad form. Naso of Kipping was first in dogs under 55 pounds and we think properly so, he is a liver and white, shown in good condition, and possessing good feet, legs and body, with plenty of character. Third is leggy and light of bone. Second, a puppy, only 11 months, is full of promise. Vhc. Russell is a good, game-looking dog, full of go, he carries his tail too high. The winner in the small size bitch class was a lemon and white, possessing a deal of quality. Mr. Price coming second, with a very good liver and white, in fact a great many in this class were full of merit and had about the keenest competition of any of the pointer classes. The puppy class contained several good ones, the winner in open dogs had to put up with second here, nevertheless we fancied he had a clearer win here than he had in the open class.

SETTERS.

In English setters Sting and Plimsy won, the latter having only Rhona II. to beat, while Sting had no opponent. We could not follow the judge in the open classes. The first and second prize winners we have often reported upon, while the third prize dog was the winner at Birmingham. We fancied Laverack Chief and King Ned about the best in the class. The latter was only c., while Laverack Chief was unnoticed. Wild Rose won well in the bitch class, and Meg Merrilies made a good second. In dog puppies first and second were full brothers, by Sir Alister. There were only two entries in the bitch puppies. There was nothing striking in Gordons. We fail to see any such as old Duke now. The bitch class was the best, but evidently Gordon setters are not improving. In champion Irish setters Gannymede beat his kennel companion, Tyrone, and Geraldine had no opponent in bitches. In open dogs we think the second prize ought to have won. He is no doubt cheap at his catalogue price (£20), and was soon claimed. In bitches we fancied the reserved Nellie III. as about the best. In the puppy class the winner (Mate) in the open dogs only got vhc., which speaks well for the class. The winner here will be heard of again.

SHEEP DOGS.

In champion sheep dogs Eclipse was entered not for competition. First went to Rutland, who was looking well, but we certainly think Charlemagne should have held that position. We never saw him look better. The well-known red sable Peggie II. won in champion bitches, having no opponent. The open classes for collies were the best we have ever seen. Such a lot of good dogs that never got into the prize list we have never seen on any previous occasion. Lynn, hc., dark sable, with white breast, has a good head, well-carried ears, plenty of coat, good size, and stood on the best of feet and legs. Rockingham, third, is a true collie, and was considered by many the best in the class. We know the owner refused a large offer for him. Bounce, c., another good red sable, changed hands. Mr. Dockrell won second and fourth with a pair of good puppies by Eclipse. King of the Glen, another of Eclipse's stock, is a wonderful good dog, with good head and ears, capital coat, and in the pink of condition. The winner is a black and tan puppy by Rutland, with perfect coat, good feet and legs; he is rather short in body. He also won first in puppies. The bitches were another good class, the winner another of Rutland's puppies and full sister to the winner in the dog class; in color black, with a head all tan or red color. She is full of character and possesses a real good coat with good ears. She also won in bitch puppies, beating Matchless, that was claimed at £100 during the Birmingham show. We may sum up by saying there was scarcely any of the noticed, dogs, bitches or puppies, and a great many of the unnoticed, but were full of merit and fit to take leading honors; in fact we are sure that a great many of the unnoticed dogs will be heard of again, and be able to render a good account of themselves.

BASSET HOUNDS.

In champion basset hounds Mr. Blair won easy with Bourbon, who was looking well, while Mr. Krehl got the reserve. In open dogs we find M. Louis Kane at the head of affairs with a grand hound, and the same exhibitor first, second and third in bitches; also second in bitch puppies—not so bad for a stranger with only five entries. Surely he will never take them all back to France again; from what we heard there will be at least one remain in England.

DALMATIANS.

Treasure was once more first in Dalmatians.

POMERANIANS.

Charlie was again first. We missed him at Birmingham, where he could have easily won. Scoff, also well known, came second.

POODLES.

That grand black poodle, Mr. Lawrence's Lyris, was the only entry in the class for championship. He is the best we have seen, and goes on improving every day. The first and second in the open class were also good specimens, but still a long way behind Lyris.

BULLDOGS.

In large-size champion bulldogs there was only one entry—Taurus. In small-sized champions Grabber won, we think closely pressed by Cervantes, who is much the best bulldog, bar being too much out at elbows. In champion bitches under 50 pounds the well-known Britomartis won. In the open class for large-sized dogs and bitches the quality was good and the awards gave every satisfaction. The winner has been reported upon several times and was here looking well. In the next class Rustic King, the Birmingham winner, very much improved, won well. Royal George is commencing to show age and is not so good in head proportion, yet he possesses a good body and plenty of bone. In the over 35 pounds and under 50 pounds Lady Stewart was correctly placed first, while the second prize winner was only a puppy and lucky to get so far up. Her body is good but she is weak in head. We think the third and vhc. reserve might have been above her. In small dogs the awards did not meet with general approval. Many fancied the vhc. Dom Pedro to any in the class. Ossian, the third prize, was claimed at the catalogue price, £22 10s., and the second prize winner, catalogued at £12 12s., we believe remained unsold. Ridotto, the Birmingham winner, and sister to Rustic King, was once more first and yet never shown in proper condition.

SPANIELS.

Irish water spaniels, as usual, were a small class. The winning dog was looking better than we ever saw him, and won well, the second being coarse in head, Mr. Hockey's two bitches being again first and second in the bitch class. We still fancy Young Hilda very much, yet she is too strong in head for a bitch.

In Clumbers, champions, we thought Psycho best, the winner, Boss II., being too long in face for a clumber. In open dogs, Ramble, in bad form, won first, second going to Duke, who is not enough marked over the body to please me, and he has a wall eye, bar which, he is a most typical specimen.

We think Haratio won well in Sussex or liver-colored spaniels, but would have placed Guy second, Noble being too dark in color. Brida won easy in bitches. In other colored champions Solus again won first.

In black dogs the winner is plain in head; the second worse. The class was a bad one. Bitches had only four entries in the next class; the first and second were both good ones, the former lowest on leg while the later is rather the best in head. The following two classes were poor, except Easten's Bride, much improved and closely pressed by Zuess for first honors. Obo won once more in cocker dogs, with his son Keno coming next. There was only one of any merit in the cocker bitch class.

FOX-TERRIERS.

In fox-terrier champions, Result, still going on favorably, won, and correctly so. Spice was second. Bedlamite won in champion bitches. She is remarkably good in feet and legs, but was it not lucky that Sutton Veda was out of the way. We hear that Mr. Field's entries were late and returned. In this class we preferred Richmond Patchwork to the third prize Joyful. In open dogs the second prize is a good sort, but rather light in eye. Third and fourth both seem rather wide in front, but have good bone and substance. Reckoner, the winner, we think deserved his position, yet he has not a very taking expression. The winner in the next class turned up in Rosebloom, who beat Redamite, the winner, in the champion class for a special cup, and we heard no grumbling. She is certainly a very handsome one, and few faults can be found with her. Poppy II., reported upon at Dublin, is rather large in ear and fine before the eye, but withal a nice bitch, but lucky to get so far up. The puppy classes contained some very promising young ones, and the wire-hairs were well represented; but yet are deficient in coat so much so that you can with difficulty find one out of twenty with a real wire-haired coat.

TERRIERS.

In bull-terriers Mistress of the Robes won in the champion class, she was looking well. In large size dogs we would have placed Chancellor first, being better in shoulders, feet and legs than the winner. We also thought the second prize bitch in the following class should have won; however, she is only a puppy yet and we expect to see more of her. The winner has been previously reported upon, having won first here last July and second at Birmingham. In the small size dogs Florence, first at Birmingham, was only third here; the winner was thin and shelly.

Airedales are getting more even in type, all the winners are well known about York and Lancashire.

There were good classes of Bedlingtons, but the judging did not seem to give general satisfaction. In the open class we thought Hairdresser a long way the best, while in bitches we fancied Topsy and Domino most. A very good puppy won and was claimed at £10.

Irish terriers, as a collection, were poor.

In white English terriers Lucky Star, properly named, won, his kennel companion, Leading Star, being much the best. North Star, vhc., is well known.

Champion black and tans had five entries, and Burke was once more at the head. The winner in the open class was correctly placed yet we think Welch Rat, second, very lucky in getting so far in the prize list, he is a very nice little dog but very far behind first-class form. We preferred Debonnaire for second prize. In bitches, exceeding 16 pounds, we think the winner very lucky, being weak in face, we preferred Kenwood Queen and Duchess of Edinburgh. In small size black and tans Witch, second at Birmingham, won, and the winner at Birmingham was unnoticed, yet we still think highly of her but being uncropped she does not possess the sharp trig appearance of a cropped dog.

In Skye terriers Claret, not in the best of form, won. In drop-eared Skyes, all the winners were small, of good stamp, but short in coat, while Strathmore, vhc., the best we have ever seen, bar size, which is a little too large, was our fancy for first. This dog is particularly long and low and has a remarkably long, straight coat of the correct texture. In prick-eared Skyes we find Mr. King, all the way from Paisley, at the head of affairs, and no doubt deservedly so, the second being very moderate.

We have seen better classes of Scotch terriers. The winners are all well known and were much ahead of others, yet we know the Captain has several better in his kennels. Mr. Adamson exhibited a very good puppy and won first; had it shown as well in the open as in the puppy class, it possibly would have been third instead of hc.

PUGS.

Bradford Ruby won well in champion pugs. We have often reported on him; bar being a little large, he is about the best we know. Dowager won in champion bitches, closely pressed by Luna II. In open dogs the winner is new to us, and we were pleased to make his acquaintance, he is such a cobby, short little fellow, with good eye, skull, and small ears and beautifully curled tail. We did not quite admire the brownish shade of his nose, which we noticed also on the second, which is another handsome little dog. Master Tragedy came vhc. This dog possesses a good deal of pug character, and it is very difficult to find a better. Daniel, whose name we have seen pretty often in print, came third. He is another good sort; it is a pity that his ears are wrong. In the bitch class we thought it a very near thing between the winners; but as we did not see the class except in their pens, we cannot compare them enough to pass an opinion, but we find the judge has marked it a good class, and Mr. Sheffield is quite fit to form an opinion on that matter. In puppies we find no fewer than nineteen entries, and marked a very good class. We thought the second prize puppy quite too small in eye, yet we find, except three, all in the class got noticed.

TOY DOGS.

In Yorkshire terriers the two prizes were divided between Effie and Conqueror; we can't see the reason, as the latter in our opinion had a clean win.

As usual, Lady Gifford had no opponent in Maltese. That lady had four entries but only three turned up.

Of the two champion Blenheims, we preferred Flossie to Bowsie. Only four moderate specimens turned up in the open class; Prince Leopold being quite too small in skull. Alexander the Great added another win to his already long list. In the bitch class Gypsy II. is small. The second was in bad health and should have been turned out of the show. First to Jumbo II.; he was much the best. This dog also won at Birmingham last month.

There were only two Italian greyhounds, and we think they were wrong placed.

Mrs. Troughear won again with Conquerer in rough toys exceeding 6 pounds. Smooth toys were headed by a very nice little black and tan, the second prize winner being of the same variety but too dark in color. In rough toys, under 6 pounds, first and second went to Mr. Foster. After that the others were ordinary little ladies' pets evidently entered for sale.

LONDON, Jan. 19, 1885.

[For list of awards see last issue.]

ST. JOHN DOG SHOW.

ST. JOHN, N. B., Jan. 30.—This show which has just closed has been the best yet held in this city and has been pronounced by those competent to judge as good an exhibition as ever was held east of New York. There were two hundred and twenty-three entries and the dogs showed a great improvement over that of last year, particularly in the collie and sporting classes (excepting the pointers, which were a very indifferent class). In the collie classes Mr. Mortimer expressed himself as greatly surprised, as he had never met such good lot outside of New York. Everything passed off very smoothly and nicely, and if we may believe the expressions of those exhibitors who attended from the United States they will be sure and again visit St. John on the next similar occasion. At the close of the show, on Saturday evening, Lieut.-Colonel Blaine gathered the executive committee together and escorted the American exhibitors to the Princess street ferry. Before leaving the visitors were heartily cheered by the St. John men, a courtesy which was handsomely acknowledged by the departing exhibitors, who have frequently expresssed themselves greatly pleased, not only with the show and its management, but also with the courteous treatment they had received while in St. John.

Upon the return of the committee to the exhibition rooms Col. Blaine requested the attention of those present to the following tribute to Mr. H. W. Wilson, secretary of the association:

"St. John, N. B., Jan 30. To H. W. Wilson—Dear Sir: We, the undersigned, exhibitors in the fourth annual bench show of dogs held in this city, take the opportunity of expressing our acknowledgment of the courteous treatment and attention we have received at your hands. We feel that your performance of the onerous duties devolving upon you as secretary of the committee of management contributed largely to make the show the success it has proved. We trust that in the future your untiring energy and interest may be rewarded by even a greater measure of success than in the past. We are, dear Sir, yours faithfully, Joseph Hayes, Boston; John E. Thayer, Lancaster, Mass.; F. H. Stanarth, Portland, Me.; Gould N. Brown, Halifax, and fifty others."

Mr. Wilson, in reply, thanked the gentlemen for the kindly sentiment expressed in the address and hoped that he would often meet them again. Later in the evening, at a private entertainment of the executive committee, the large amount of gratuitous labor performed by Mr. Wilson on behalf of the committee was referred to in the most complimentary terms by Col. Blaine and several others, and a resolution of thanks was passed, unanimously embodying similar sentiments to those expressed in the address.

Following is the official list of the

AWARDS.

MASTIFFS.—*Dogs:* 1st, withheld; 2d, J. M. Kay (Lyon).

ST. BERNARDS.—*Dogs:* 1st, F. W. Daniel (Grant). *Bitches:* 1st, W. E. Raymond (Nigger).

NEWFOUNDLANDS.—*Dogs:* 1st, Thos. R. Burchell (Goliath); 2d, W. F. Pepper (Nero). *Bitches:* 1st, Thos. Cullman (Jess); 2d, Wm. Agate (Pedro). PUPPIES.—*Dogs:* 1st, John Lennihan (Captain); 2d, Wm. Holman (Jack).

GREYHOUNDS—*Dogs:* 1st, A. M. K. Doull (Bran); 2d, A. S. Benn (Guard).

DEERHOUNDS.—*Dogs:* 1st, John E. Thayer (Lance); 2d, Dr. John Bergman (Vaughn). *Bitches:* 1st, A. M. and T. W. Magee (Jess); 2d, John E. Thayer (Lorna II).

POINTERS.—PUPPIES—*Dogs:* 1st, John Stewart (Rab). *Bitches:* 2d, Dr. Bruce (Julia).

ENGLISH SETTERS.—*Dogs:* 1st, John Flemming (Rex); 2d, Wm. R. Carville (Danbury News). *Bitches:* 1st, Michael McGivern (Fan); 2d, R. Blackall (Minnie).—PUPPIES—*Dogs:* 1st, John Mitchell (Danbury News, Jr.); 2d, S. Robertson (Mac). *Bitches:* 1st, H. W. Thompson (Floss).

GORDON SETTERS.—*Dogs:* 1st, John E. Thayer (Argus); 2d, J. C. Allison (Tony). *Bitches:* 1st, Thomas R. Bushell (Fanny); 2d, R. M. Gibson (Nell).—PUPPIES—*Dogs:* John E. Thayer (Argus II.). *Bitches:* 1st, L. R. Thompson (Flora).

IRISH SETTERS.—*Dogs:* 1st, Jos. Hayes (Suil-a-Mor); 2d, R. M. Gibson (Romeo). *Bitches:* 1st, Jos. Hayes (Dido); 2d, Thos. J. Egan (Nellie).—PUPPIES—*Dogs:* 1st, E. W. Outram (Rosey); 2d, Jas. W. Manson (Stop). *Bitches:* 1st, Robt. Blackall (Maudie).

IRISH WATER SPANIELS.—*Dogs:* 2d, A. H. Campell (Ginger). *Bitches:* 2d, W. Blatchford (Rose).

CLUMBER SPANIELS.—*Dogs:* 1st, Robert McLeod (Maxie); 2d, Chas. Morrisey (Spirit). *Bitches:* 1st, John McB Morrison (Jet); 2d, H. G. McLean (Veave).—PUPPIES—*Bitches:* 1st, James Devlin (Dash).

FIELD SPANIELS.—*Dogs:* 1st, Alex Wright (Spirit); 2d, W. F. Danahar (Jack).—PUPPIES *Dogs:* 1st, J. H. Carvell (Jack).

FOX-TERRIERS.—*Dogs:* 1st, John E. Thayer (Raby Tyrant); 2d, W. H. Thorne (Spot) *Bitches:* 2d, H. Rowan (Sally).—PUPPIES—*Dogs:* 1st, John E. Thayer (Grey). *Bitches:* 1st, John E. Thayer (Shame).

COLLIES.—*Dogs*: 1st, J. W. Gilmore (Bonnie Laddie); 2d, A. C. Fairweather (Shep). *Bitches*: 1st, W. O. Purdy (Rose); 2d, F. W. Kaye (Marjory).—PUPPIES—*Dogs*: 1st, A. C. Fairweather (Robin); 2d, E. S. Kaye (Olinthus). *Bitches*: 1st, Joseph Hayes (Rosey); 2d, Robert Blackall (Phyllis).

DALMATIANS.—*Dogs*: 1st, R. H. Grimley (Nero); 2d, C. King (Spot).

BULLDOGS.—*Dogs*: 1st, John E. Thayer (Tippoo). *Bitches*: 1st, John E. Thayer (Bellissima).

BULL-TERRIERS.—*Dogs*: 2d, Col. A. Blaine (Crib). *Bitches*: 1st, Col. A. Blaine (Nellie); 2d, W. A. Pattison (Bones).—PUPPIES—*Bitches*: 1st, Col. A. Blaine (Nellie II.).

IRISH TERRIERS.—*Dogs*: 1st, G. W. Campbell (Ginger). *Bitches*: 1st, John Collins (Mollie); 2d, J. Lennihan (Flora).

SKYE TERRIERS.—*Dogs*: 1st, George Sanderson (Wattey); 2d, B. A. Weston (Twister). *Bitches*: 1st, S. Z. Dickson (Jessie).—PUPPIES—*Dogs*: 1st, A. Morrison (Sandy); 2d, F. Collins (Snap). *Bitches*: 1st, George Sanderson (Little Diffit).

PUGS.—*Dogs*: 1st, James Griffiths (Pug); 2d, W. O. Purdy (Sambo). *Bitches*, 1st, Douglass Troop (Judy); 2d, Forest City Kennels (Dolly). PUPPIES—*Dogs*: 1st, E. Le Roi Wilson (Jack). *Bitches*: 1st, Forest City Kennels (Almale).

BLACK AND TAN TERRIERS.—*Dogs*: 1st, Col. A. Blaine (Dan); 2d, W. Ingham (Dex). *Bitches*: C. B. Morrison (Daisy); 2d, J. A. Ewing (Sylvia).

YORKSHIRE TERRIERS.—*Dogs*: 1st, Chas. Buxton (Charlie); 2d, Chas. Buxton (Harry). *Bitches*: 1st, John Allen (Biddy); 2d, John Allen (——).

TOY TERRIERS.—*Bitches*: 1st, A. Magee (Jule); 2d, E. LeRoi Wilson (Tooth Ache).—PUPPIES—*Dogs*: 1st, C. A. McCulley (Strephon).

SPECIAL PRIZES.

Best mastiff, J. Murray Kay's Lyon.
Best St. Bernard, F. W. Daniel's Grant.
Best Newfoundland, J. Lennihan's Captain.
Best greyhound, A. M. K. Doull's Bran.
Best deerhound, John E. Thayer's Lance.
Best pointer, John Stewart's Rob.
Best English setter, John Flemming's Rex.
Best Gordon setter, John E. Thayer's Argus.
Best Irish setter, J. S. Hager's Suil-a-Mor.
Best Clumber spaniel, G. N. Brown's Spot.
Best cocker spaniel, J. McB. Morrison's Jet.
Best field spaniel, Alex Wright's Sport.
Best fox-terrier, John E. Thayer's Raby Tyrant.
Best collie, John W. Gilman's Bonnie Laddie.
Best Dalmatian, R. H. Grimley's Leo.
Best bull, John E. Thayer's Bellissima
Best bull-terrier, Col. A. Blaine's Nellie.
Best Irish terrier, J. Collins's Mollie.
Best Skye terrier (prick-eared), Geo. Sanderson's Wattey.
Best Skye terrier (drop-eared), S. Z. Dickson's Jessie.
Best pug, Jas. Griffiths's Pug.
Best black and tan terrier, Col. A. Blaine's Dan.
Best Yorkshire terrier, J. Allen's Biddy.
Best toy terrier, C. A. McCulley's Strephon.
Best sporting dog, John E. Thayer's Argus.
Best dog or bitch, John E. Thayer's Bellissima.
Best dog in largest class, Col. A. Blaine's Nellie.
Best litter puppies, F. McCash's pugs.

NEW YORK FANCIERS' SHOW.

THE third annual exhibition of dogs, held under the auspices of the New York Fanciers' Club, opened at Madison Square Garden on the 4th inst. and closed on the 11th. There were only about 75 dogs all told, and the quality throughout was very inferior. Mr. Walton, of Boston, officiated as judge, but owing to the lack of competition in most of the classes his duties chiefly consisted in handing out the ribbons from his chair. The arrangements were of a very inferior order, and the catalogues were simply useless. In one pen, No. 986, was an Irish setter, in the next a Yorkshire terrier, followed by a fox-terrier puppy; then came a black and tan toy, after that two pugs, then a mastiff puppy, then a lady's address, and following that a French poodle.

In the fox-terrier dog class Scarsdale won from his kennel companion Spite. Age does not improve the son of Joker, whose faulty head grows coarser. Spite is leggy. Clover Belle, in the bitch class, showed the most character, but she is faulty of head and is too long-cast. Nellie is light of bone and plain of face. The Clovernook Kennels entries were all out of condition, and one of them, Clover Blossom, should be treated for the mange. In the puppy class the unnoticed Jip was our choice for second place, although he is leggy. The winner, a fair good puppy, is heavy of ears and is too long-cast: bone, legs and feet fairly good. The second prize winner is too full at the brow and has badly carried ears. In legs, feet, bone and coat it is pretty good. The third prize winner is faulty of head and coat.

Treasure was alone in the champion pug class and he won. We were not aware that he had won three first prizes, and he was shown in the open class at New York last October. But how did he manage to win the special prize for the best pug "that has not won three prizes at recognized American shows"? When there is a champion prize in view Treasure competes for it, whereas on other occasions he is a novice. A very useful dog, with a most appropriate name. He has a fair good head, but is too large, coarse of coat, and has no trace mark. The winner in the open dog class will never be heard of in good company. In the bitch class, Tra-la-la won easily. She is a bit apple-headed and small of eye. The puppy class failed to introduce us to anything likely to develop into winning form.

The Yorkshires were a very inferior lot; in fact, we failed to find one capable of winning a commended card in good company. The best was all off in color and coat. The first prize toy bull-terrier is a niceish little dog and was one of the best in the show. In the King Charles spaniel class, Mrs. Lucy took all the prizes, but her entries are a long way removed from first-class form. The winner, Duke, has a pretty good head, but he is too small and light of eye, besides being faulty of coat and short of ears. When will somebody exhibit a good King Charles? Our dogs are too small of eye, a very important point, and instead of having ears away down almost to the ground, we find a bit of leather about the size of the ears of a mongrel fox-terrier.

Mrs. Lucy also entered two red and white dogs in the class for Blenheims, but the judge said they were not Blenheims and therefore he transferred them into the class for tricolors, and other toy spaniels. We are of the opinion that red is essentially a Blenheim color, but if we are mistaken we fail to see how red and white dogs could compete in a class for tri-colored or reds. A tri-colored dog would be a dog of three colors, and a red and white dog most certainly would not be a red one. Mrs. Lucy was right and perhaps the management will take the hint and "read up." If they do this they won't make a class for Blenheims and another class for reds. The winner in the Italian greyhound class is a half-bred whippet, off in color and much too large. Mr. Chamberlain's poodles are fair specimens. They would be improved by length of ear and tightness of curl.

The first prize Skye has a fair, good head, but not coat enough for a good one. The winner in the Irish terrier and Dandie Dinmont class is neither one nor the other, and the prize should have been withheld. There was only one black and tan toy on view, and he is not a good one. He lacks color and is faulty in face and feet markings. The name of the Chinese crested dog did not appear in the catalogues, so-called, and we were not successful in getting the name of the owner either. The dog took a first prize and is not a bad specimen. His crest is not profuse and he has no tuft at the end of his tail; he is also too short on the legs. We liked his color and markings very much.

AWARDS.

FOX-TERRIERS.—*Dogs*: 1st, Clovernook Kennels (Scarsdale). *Bitches*: 1st and 3d, Clovernook Kennels (Clover Belle and Priscilla); 2d, Charles Hyland (Nellie). *Puppies*: 1st, 2d and 3d, Clovernook Kennels.

PUGS.—CHAMPION—Chequassett Kennels (Treasure).—OPEN—*Dogs*: 1st, J. R. Gildersleeve (Dude). *Bitches*: 1st, Chequassett Kennels (Tralala); 2d, Anthony Henner (Gypsy); 3d, John T. Bladen (Fanny). *Puppies*: 1st, Anthony Henner (Dolly); 2d, Walter Scott (Snip).

YORKSHIRE TERRIERS.—OVER 5LBS.—1st, J. R. Gildersleeve (Daisy).—UNDER 5LBS.—1st, John Yunker (Prince); 2d, J. R. Gildersleeve (Spider).

BULL TERRIERS.—UNDER 10LBS.—1st, William Scott (Jim); 2d, J. R. Gildersleeve (Boxer).

KING CHARLES SPANIELS.—1st, 2d, and 3d, Mrs. A. W. Lucy (Duke, Belle of Bowery and Covent Garden Lady).

TRI-COLOR, RED AND OTHER TOY SPANIELS.—1st and 2d, Mrs. A. W. Lucy (Rose and Baby Mine).

ITALIAN GREYHOUNDS.—1st, J. R Gildersleeve (The Blanch).

POODLES.—1st, 2d and 3d, Mrs. J. E. Chamberlain (Major, Bonnie and Mignonette).

SKYE TERRIERS.—1st, George Morley (Duke).

IRISH AND DANDIE DINMONT TERRIERS.—1st, Alfred Bonny (Joco).

BLACK AND TAN TERRIERS.—1st, Henry Gravenstede (Tommy).

LITTERS OF PUPPIES.—1st, J. R. Gildersleeve (Irish setters).

SPECIAL PRIZES.

Best pug, Treasure.
Best display of pugs by one exhibitor, Chequassett Kennels.
Largest number of entries, Clovernook Kennels.
Finest litter of puppies, J. R. Gildersleeve's Irish setters.
Largest and best collection of Yorkshire terriers, J. R. Gildersleeve.
Largest and best collection of pugs, Chequassett Kennels.
Best King Charles spaniel, Duke.
Best King Charles spaniel with one or more of his progeny, Duke.
Best pug puppy, Dolly.
Second best litter of puppies, W. H. Jockel, Jr.'s berghunde.
Best poodle, Major.
Best Yorkshire terrier, Prince.
Smallest black and tan terrier over one year old, Tommy.
Best Mexican hairless dog, Mrs. L. D. Hurd's Pippo.

NEW HAVEN SHOW.

THE second annual show of the New Haven Kennel Club will be held in the Second Regiment armory, that city, March 18–20. The judges appointed are:

John Davidson, Monroe, Mich.—Pointers, foxhounds, beagles, dachshunde and collies.

Jas. F. Kirk, Toronto, Ont.—Newfoundlands, greyhounds, deerhounds, bulldogs, bull-terriers, fox-terriers, and all other terrier classes, pugs, Italian greyhounds and poodles.

Jas. Watson, Philadelphia, Pa.—St. Bernards, field spaniels, cockers, King Charles, Blenheim, mastiffs and miscellaneous.

C. S. Westcott, Philadelphia, Pa.—English setters, Irish setters and Gordon setters.

Mr. James Mortimer consented to act as judge, and the Newfoundland, greyhound, deerhound, bulldog, bull-terrier, fox-terrier, and all other terrier classes, pugs, Italian greyhound and poodle classes were assigned to him, but he wrote the club that he was not satisfied with this arrangement and refused to act. Mr. James F. Kirk was at once requested to serve. Up to the time of our going to press his reply had not been received.

The premiums are in all the principal classes $10 and $5; other classes and puppies, $8 and $4. The specials aggregate $500. American Kennel Club rules will govern. Secretary, E. S. Porter, No. 781 Chapel street, New Haven.

NATIONAL FIELD TRIALS CLUB.

LA GRANGE, Tenn., Feb. 2, 1885.

Editor Forest and Stream:

The executive committee of the N. F. T. Club have adopted the following programme for their trials of 1885, run Dec. 7:

All-Aged purse, $750; $250 to first, $250 to second, and $250 to third. $15 forfeit and $15 additional to start. Entries to close Nov. 1.

Derby purse, $750; $250 to first, $250 to second, $250 to third. $10 forfeit and $10 additional to start. Entries to close April 1. B. M. STEPHENSON, Sec.

PHILADELPHIA NOTES.

Editor Forest and Stream:

Having lately heard reports of complaints made by the farmers of Delaware and Chester counties, Pa., against the several fox-hunting clubs of the sections named, your correspondent determined to make further inquiries on the subject, and selected the Farmers' Market of this city, whose stalls are in great measure rented by farmers of the counties mentioned. Taking the aisles of this market, a systematic interviewing of most of its occupants failed to find a single person who did not speak in the highest terms of the fox-hunting clubs, in fact every one stated to me that any damage inflicted in hunting over the farms, which very seldom occurred, was invariably remedied. The reports that have become circulated arose from the fact that some time since several half-grown puppies from one of the kennels got loose and killed an old hen or two.

Mr. Geo. Lewis and Mr. Geo. Hill led a party of hunters from the Rose Tree Hunt Saturday last, and started a fox on the Taylor farm, in Upper Providence. Reynard proved to be more than usually keen, and after running several miles in a circle, found refuge in the rocks of Blue Hill, from which he could not be dislodged. Mr. Hill then worked up Crum Creek, for several miles, and started another fox, which ran through a portion of Middletown and out by the Barrens in Edgemont, until late in the afternoon, when the hounds were taken off.

The Lima Hunt Club of Middletown had a splendid chase yesterday afternoon. This club claims some of the best huntsmen and dogs in Delaware county. The fox which gave them such a good run yesterday was "dropped" and given about a quarter of an hour start. Not knowing the neighborhood, which is full of safe refuges, he took a bee line through Upper Providence, Springfield, and then back of the Rose Tree. A portion of the dogs of the latter club were in their kennels, became wild with excitement, and a few of them jumped the six-foot board fence and joined in the chase. The Lima Club holed their fox at Howelville. HOMO.

THE COLLEY CLASSES.

Editor Forest and Stream:

Even though they may contain some unnecessary personalities, "Lillioulero's" letters are always interesting and instructive. His strictures on myself in his letter dated Dec. 24, 1884, necessitates my asking you to allow me to make a few egotistical remarks.

I am not aware how "Lillibulero" could have read my letter to mean that I advocated the dividing of the colley classes on the show bench into the numerous strains of which I spoke. Indeed I was not thinking of that matter at all, but simply mentioned some of the colley strains (I never pretended that they were all the strains that exist, and therefore "Lillibulero" loses instead of makes a point over the Welsh strain he mentions). Neither do I say that I even am cognizant of all the various strains, but I simply pointed out that many of our so-called judges are not even aware that there are so many strains. I believe myself that the colley classes are the hardest to judge of any breed of dogs.

"Lillibulero" says: "He glibly prattled of the colley of the Cheviots, etc., etc., as if to the manner born." It so happens that he has hit the right nail on the head. "Lillibulero" further says that I depreciate book knowledge. I do nothing of the sort, but I say it is absurd to depend entirely upon book knowledge, and that we want practical judges and not booky ones. My own knowledge, which I readily allow is very small compared to the vastness of the subject, grew with me from boyhood, and the few characteristics that I casually mentioned of various strains were gathered by myself from personal observation. I defy any enthusiastic lover of dogs to travel much without almost unconsciously noticing and storing up knowledge, and I may say that I regret that I do not own a single book on dogs, although I have read all the chief ones. The last I read, and I consider it the best, was Vero Shaw's some two years ago, from which I copied Messrs. Shirely and Thomson's opinions.

I was obliged to "glibly prattle" (as he calls it) and "parade an imposing list of colley varieties" in order to let it be seen in one letter what I meant, for, having been a good deal in every country in Europe, and there being everywhere the colley with its characteristics peculiar to almost each separate country, it would take a good deal more space than I could ask you for to dilate fully upon each strain.

We are getting away from the original subject started by you, Mr. Editor, viz.: The judging of the colley classes, but I must reply to one more point in "Lillibulero's letter. He says: "Who cares whether that old Carlyle, with his enormous coat, comes from the Highlands, the Lowlands, or the Cheviot Hills." I reply: "The owners of the bitches bred to him, if they are not fools." You would not put a Suffolk Punch to a Clydesdale horse, would you, Mr. "Lillibulero?"

Your correspondent is welcome to rattle away his heedless darts at me if it amuses him, it don't hurt me; but I should say it is a pity if he wants to abuse me, he does not do it under his own name instead of behind a *nom de plume*.

Allow me to say a few words in answer to "A Roving Highlander." The dog he mentions I know well; but I never saw it otherwise than bobtailed. Moreover, I call it an English colley, as you will see ten of them in England to one in Scotland, and I spoke of it in my first letter.

I may say that I have always spelt the word "colley," *vide* my letters, and our "Colley Club," as I believe that to be the right spelling—your printer has invariably altered it—of course, in copying your heading of the subject, I have used your spelling.

This is the second time I have broken my rule by replying to anonymous correspondents, and I may say in conclusion, that I am not surprised that "Roving Highlander" is ashamed to put his name to his letter. C. GREVILLE HARSTON.

Editor Forest and Stream:

I should like to ask "Roving Highlander" a few questions about the Highland colley in particular, and colleys generally.

"Roving Highlander" says he has "known these dogs to discover sheep under huge wreaths of snow that would ultimately have perished had it not have been for the sagacity of this trusty servant."

A member of the English Legation at Washington told a friend of mine that the colley had no nose. Since then I have watched my colleys. They frequently throw their heads in the air and wind. I live in the country, but I have never had one follow me by trail, and I have seen them nose around for a piece of meat within three feet of them, and from close observation I am under the impression they depend far more on sight and hearing than on scent. I would be glad of the opinions of others with more experience than I have on this point.

"Roving Highlander" says these Highland colleys have coats seven and eight inches long. Does not this coat when filled with wet and frozen detract from the activity of the dog at times, particularly in heavy snow?

From "Roving Highlander's" own showing these Highland colleys must be scarce even in the Highlands. He only mentions having seen two positively—those that were with the shepherds of Mr. Gordon of Bevagalic. On this occasion had not "Roving Highlander" been in frequently to see the obliging Mr. Gow of the McDonald Arms Hotel, Kerinloch Bannoch, Perthshire, and didn't "Roving Highlander" mix up the dogs and sheep, and didn't the mixture make him think their coats so long, and wasn't the "hair of the dog" over his eyes, and not the poor Highland colley's? PERTHSHIRE.

LOCUST MOUNT, Va.

RANCOCAS KENNEL.—Mr. Percy C. Ohl, the general manager of the newly established Rancocas Kennel, of which Mr. Pierre Lorillard is the proprietor, has just returned from a purchasing tour, selecting the choicest stock to be obtained. It is Mr. Ohl's intention to profit by the experience of others, as we note his selection for breeding purposes form well-known bitches and his continuance of an established "nick." Among the purchases are Lavalette (Druid Princess Draco), the dam of Paul Gladstone and other grand dogs. She has always been bred to Gladstone, and is at present in whelp to him. Another purchase is Blue Belle (Rattler—Daisy), the dam in one litter of three pups (by Dashing Monarch) that won first the first time shown. As this breeding is like the foregoing, a "nick," it will in all probability be continued. Vannette (Count Dick—Petrel) is the same blood as Count Wind'em. Mr. John C. Higgins says Vinnette is the most vigorous, untiring bitch he ever saw, and while her pups have been unusually fine and well marked, they have been lost through carelessness. She has been bred to Dashing Monarch. The extra champion bench winner, Petrel II., is also among the purchases. Her winnings are more than any other bitch ever shown, having won three champion and one extra champion stakes, besides many firsts, specials and medals. Mr. Ohl intends breeding her to Count Noble or Gladstone. Besides the above, quite a number of young dogs of noted breeding have been secured; also Dashing Monarch (Dash II.—Countess Moll). Nine whelps of Monarch's begetting in one season's shows, while Plantagenet, Foreman, and many others of note in the field of his get need no comments. This line of dogs were only attainable by a large outlay of money, and the Rancocas Kennel today, though but yet one month established, contains the choicest blood in this country.

POINTER IMPORTATION.—Mr. Edward Dexter, of Boston, Mass., has just imported from the kennel of Mr. J. H. Salter, Essex, Eng., a trio of well-bred pointers. Miss Romp, a white and black bitch, is litter sister to Mr. Dexter's Mainspring, winner of one-half of second prize in the Pointer Stakes of the Eastern Field Trials Club last November. She is in whelp to champion Graphic. The others are puppies about one year old; one of them is by Priam and out of Malt, a sister of Miss Kemp, and the other is by champion Graphic and out of Hope, also sister to Miss Kemp. They arrived in good condition and have been sent to the Charlottesville Field Trial Kennel, Charlottesville, Va. Mr. Dexter has purchased the bitch Hope, also of the same litter as Miss Kemp. She will be bred to Graphic or Beihus Hector before she is sent over.

GARRYOWEN'S NOSE.—Hulton, Pa., Feb. 5.—*Editor Forest and Stream:* I notice that "Lillebulero" has tumbled into the pit over the "faking" of Garryowen's nose that I expected Englishmen would, and has attributed it to Mr. Graham. I wrote to the *Stock-Keeper* when they copied the original article, explaining that Mr. Graham was not the party struck at. As the charge of "faking" is evidently groundless, and therefore cannot injure the party aimed at, I suggest that in justice to Mr. Graham you should explain it. —W. WADE.

A BOOM IN PEDIGREES.—One hundred and twenty-five (125) entries will appear in the current number of the *American Kennel Register*. This brings the total number up to 2,113. The registry fee is 50 cents.

FOX-TERRIER CLUB.—A meeting of gentlemen interested in forming a fox-terrier club was appointed for last Tuesday evening. An early going to press rendered it necessary to defer report of their proceedings.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, or breeding or of death
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Phryne and Psyche. By Frank F. Dole, New Haven, Conn., for white bull-terrier bitches, whelped Jan. 16, by President (A.K.R. 1208) out of Scarlet III. (Young Royal—Scarlet II.).

Peek a-Boo, Frolic, Lorna and Vera. By City View Kennels, New Haven, Conn., for pugs, two dogs and two bitches, whelped Jan. 3, by Napoleon out of Daisy II. (A.K.R. 1361).

Judge and Bessie. By George W. Hunt, Springfield, Mass., for black pointers, dog and bitch, whelped Sept. 23, 1884 (Peter Black—Bessie).

Ned and Gipsy. By C. F. Keys, Washington, D. C., for Gordon setters, dog and bitch, whelped July 31, 1884, by H. Malcolm's Black (Malcolm—Dream IV.) out of Jet (A.K.R. 960).

Fly. By E. Holley, Jr., Hudson, N. Y., for liver and white and ticked cocker spaniel bitch, whelped July 4, 1883, by Dr. Cattanach's Baby out of L. A. Ehler's Fido.

Golden Floss. By E. Holly, Jr., Hudson, N. Y., for orange and white cocker spaniel bitch, whelped Oct. 29, 1884, by Colonel Stubbs, (A.K.R. 302) out of Pet (A.K.R. 314).

American Daisy and Honest Best. By E. Holley, Jr., Hudson, N. Y., for orange and white and liver, with white breast, cocker spaniel bitches, whelped May 30, 1884, by Chance (Don—Flossy) out of Fly (Baby—Fido).

Yale. By Dr. Wm. W. Seymour, Troy, N. Y., for black and white English setter dog, whelped June 23, 1884, by Blue Dick (A.K.R. 936) out of Pilgrim (Black—Louise).

Foreman II. By Tobias Burke, Nayatt, R. I., for beagle dog, whelped May 30, 1884, by imported Foreman (A.K.R. 1120) out of champion Bush (A.K.R. 139).

Peg of Limavady. By W. T. R. Ogilby, New Brighton, S. I., for white and lemon pointer bitch, whelped May 11, 1883, by Beaufort (A.K.R. 694) out of Duchess (Sensation—Whiskey).

Flasher. By F. D. Ogilby, New Brighton, S. I., for white, black and tan beagle dog, whelped June 9, 1884, by Ringwood (Ranter—Beauty) out of Roxey (Rattler—True).

Gaylard. By Geo. B. Inches, Boston, Mass., for white, black and tan fox-terrier dog, whelped Aug. 3, 1884, by Mixture (Spice—Fairy III.) out of Jaunty (Joker—Torment).

BRED.

☞ *See instructions at head of this column.*

Daisy—Grand Duke. H. W. Holmes's bull-terrier bitch Daisy to champion Grand Duke (A.K.R. 524), Jan. 25.

Lassie—Grand Duke. Wm. Pretyman's bull-terrier bitch Lassie to champion Grand Duke (A.K.R. 524), Jan. 16.

Lady Mac—Joker, Jr. G. H. Nixon's (Leesburg, Va.) pointer bitch Lady Mac (Faust—Gertrude) to his Joker, Jr. (Beaufort—Nymph), Jan. 24.

Fannie Turner—Joker, Jr. G. A. Wynkoop's (Leesburg, Va.) pointer bitch Fannie Turner (Sensation—Queen II.) to G. H. Nixon's Joker, Jr. (Beaufort—Nymph), Jan. 26.

Gipsey—Hero II. W. D. Cook's (Boston, Mass.) mastiff bitch Gipsey (Turk—Baby) to the Ashmont Kennels' champion Hero II. (A.K.R. 545), Dec. 27, 1884.

Lorna Doone—Hero II. The Ashmont Kennels' (Boston, Mass.) mastiff bitch Lorna Doone (Crown Prince—Ilford Baroness) to their Hero II. (A.K.R. 545), Dec. 7, 1884.

Lady Gladys—Hero II. C. H. Morgan's mastiff bitch Lady Gladys (Crown Prince—Rowena) to the Ashmont Kennels' champion Hero II. (A.K.R. 545), Jan. 5.

Peg of Limavady—Scout. W. T. R. Ogilby's (New Brighton, S. I.) pointer bitch Peg of Limavady (Beaufort—Duchess) to D. G. Elliott's Scout (A.K.R. 216), Dec. 20, 1884.

St. Kilda—Beaufort. C. A. Chapman's (Nyack, N.Y.) pointer bitch St. Kilda (Ranger—White Lilly) to C. H. Mason's Beaufort (A.K.R. 694), Feb. 2.

Marchioness—Schoonhoven. The Alpine Kennels' (Mount Vernon, N. Y.) St. Bernard bitch Marchioness (A.K.R. 1268) to their Schoonhoven (A.K.R. 795), Jan. 26.

Virginia—Fritz. C. W. Littlejohn's (Leesburg, Va.) pointer bitch Virginia (A.K.R. 1357) to his Fritz (A.K.R. 1351), Jan. 31.

Leigh Doane—Chief. I. H. Roberts's (Philadelphia, Pa.) red Irish setter bitch Leigh Doane (A.K.R. 58) to Max Wenzel's Chief (A.K.R. 231), Jan. 11.

Jill—Joker, Jr. G. H. Nixon's (Leesburg, Va.) pointer bitch Jill (Doctor II.—Fannie Turner) to his Joker, Jr. (Beaufort—Nymph), Feb. 2.

WHELPS.

☞ *See instructions at head of this column.*

Scarlet III. Frank F. Dole's (New Haven, Conn.) bull-terrier bitch Scarlet III. (Young Royal—Scarlet II.), Jan. 16, two bitches, by President (A.K.R. 1208); both white.

Kitty Wells. The Maple Kennels' (Patterson, N. Y.) pointer bitch Kitty Wells (A.K.R. 1043), Jan. 28, six (three dogs), by their Fritz (A.K.R. 260); one since dead.

Sheila. The Alpine Kennels' (Mount Vernon, N. Y.) St. Bernard bitch Sheila (A.K.R. 796), Jan. 26, ten (five dogs), by their Carlo (A.K.R. 89).

Faustina. John Watkin's pointer bitch Faustina, Jan. 13, eleven, by C. H. Mason's Beaufort (A.K.R. 694).

Wallkill Blanche. Archibald Gordon's (Middletown, N. Y.) cocker spaniel bitch Wallkill Blanche (A.K.R. 1301), Jan. 17, seven (three dogs), by Hornell Silk (A.K.R. 1397).

Ursula. The Alpine Kennels' (Mount Vernon, N. Y.) St. Bernard bitch Ursula (A.K.R. 26), Jan. 31, four (one dog), by their Carlo (A.K.R. 89).

Eria. Frink Rivers's (Bridgeport, Conn.) pointer bitch Eria (Rake II.—Browny), Jan. 29, seven (four dogs), by champion Rush (A.K.R. 357); all lemon and white.

Althea. J. Herbert Flint's (Haverhill, Mass.) black cocker spaniel bitch Althea (A.K.R. 842), Feb. 3, six (four dogs), by the Cummings Cocker Spaniel Kennels' Ober (A.K.R. 855).

SALES.

☞ *See instructions at head of this column.*

Dick Laverack. Blue belton English setter dog, whelped June 19, 1879 (Thunder—Peeress), by T. G. Davey, London, Ont., to S. McCuen, New Orleans, La.

Anno. Smooth-coated St. Bernard bitch (A.K.R. 1606), by Essex Kennels, Andover, Mass., to Chequasset Kennels, Lancaster, Mass.

St. Kilda. Pointer bitch, age and color not given (Dilley's Ranger—White Lilly), by H. D. Towner, Nyack, N. Y., to C. A. Chapman, same place.

Venture. Dandie Dinmont terrier dog, whelped Nov. 8, 1884, by Peel (A.K.R. 1407) out of Vixen (A.K.R. 434), by Thos. H. Bell, Troy, N. Y., to Hon. Erastus Corning, Albany, N. Y.

Dashing Monarch. White and black English setter dog, whelped Aug. 25, 1878, by Llewellin's Dash II. (Laverack's Blue Prince—Armstrong's Kate) out of Countess Moll (Dan—Countess), by J. C. Higgins, Delaware City, Del., to Pierre Lorillard, New York.

Vannette. English setter bitch, age not given (Count Dick—Petrel), by J. C. Higgins, Delaware City, Del., to Pierre Lerillard, New York.

Petrel II. Blue belton English setter bitch, whelped Jan. 9, 1878 (Pride of the Border—Petrel), by E. I. Martin, Wilmington, Del., to Pierre Lorillard, New York.

Ilford Cromwell. Imported mastiff dog, whelped Feb. 23, 1883 (Cardinal—Cleopatra), by W. H. Lee, Boston, Mass., to Ashmont Kennels, same place.

Lady Emma. Liver and white pointer bitch, whelped Aug. 10, 1884 (Clipper—Countess Nelly, A.K.R. 913), by Major Lovejoy, Bethel, Me., to James Thomas, Boston, Mass.

Casperinia. Black pointer bitch, age and pedigree not given, by Major Lovejoy, Bethel, Me., to W. E. Johnson, Melrose, Mass.

Lizzie. Red Irish setter bitch (A.K.R. 1851), by Major Lovejoy, Bethel, Me., to O. F. Hill, Greenbush, N. Y.

Rose. Lemon and white pointer bitch, whelped 1882 (Ponto—Meg Merillies), by W. E. Johnson, Melrose, Mass., to Major Lovejoy, Bethel, Me.

Idstein. Smooth-coated St. Bernard dog, age not given (Cæsar—Brunhild), by Chequasset Kennels, Lancaster, Mass., to C. W. Baun, La Crosse, Wis.

Treasure II. Pug dog, age not given (Treasure—Toodles), by Chequasset Kennels, Lancaster, Mass., to Essex Kennels, Andover, Mass.

Anno. Smooth-coated St. Bernard bitch (A.K.R. 1606), by Essex Kennels, Andover, Mass., to Chequasset Kennels, Lancaster, Mass.

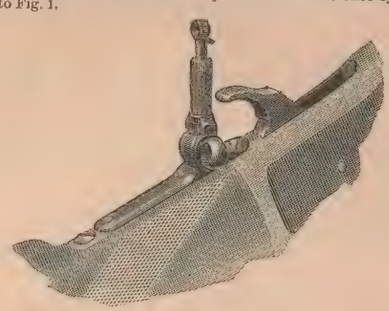
Asphodel. Smooth-coated St. Bernard bitch (A.K.R. 1607), by Chequasset Kennels, Lancaster, Mass., to F. H. Bates, Loring, Mass.

Dandy. Pug dog (A.K.R. 1936), by City View Kennels, New Haven, Conn., to D. V. Fuller, Belchertown, Mass.

Rifle and Tray Shooting.

LYMAN'S RIFLE SIGHT.

WE have recently been shown the improved Lyman sight, or more correctly speaking, the improved sight base. The improvement in this base over the former style will be seen at once by reference to Fig. 1.



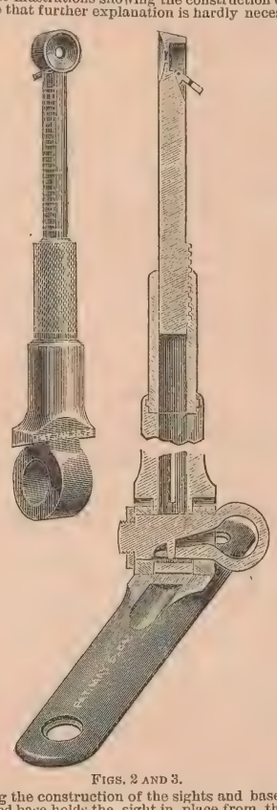


FIG. 1.

This patent base it will be noticed is very low, taking up but little room on the tang of the rifle, consequently enables the shooter to grasp the rifle with greater ease. This improvement also allows of greater elevation in shooting and all concede that it looks well on the gun. These bases are made of different lengths to adapt the sight to the different make of rifles, so that any one can screw them to the tang of a magazine rifle or to the Ballard, Sharps, Remington, and numberless other singleloaders, also a sight adapted to double express rifles and shotguns in which is used the auxiliary rifle barrel.

We give other illustrations showing the construction of the sight. It is all so simple that further explanation is hardly necessary.

FIGS. 2 AND 3.

Cuts showing the construction of the sights and base. The spring in this improved base holds the sight in place from the inside; this makes it all very compact and allows of having a thin and symmetrical base.

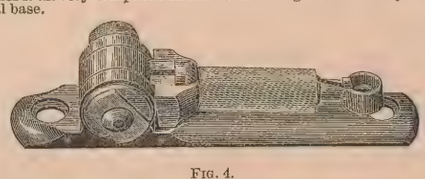

FIG. 4.

Showing sight folded down.

FIG. 5.

Showing short sight for shotguns, using the auxiliary rifle barrel and for double express rifles, folded down forward.

Mr. Lyman has received a great many letters from sportsmen who have used his sight. Among others came one from Dr. J. W. Wright, President of the New York Rifle Club. From this letter we take the following:

"From that time I have employed it exclusively on all of my hunting rifles, and am prepared to designate it as the very best thing of its kind in use. My experiences with it have involved almost every variety of shooting at the shorter ranges, *i. e.*, up to 500yds. It has been used for large and small game, in dark woods and bright sunlight, across water and overland, and I am convinced that for quick work it is unequaled. It gives the hunter all of the advantages of an abundance of light, together with a complete view of the surroundings of the object to be hit. With a running deer it not only enables the sportsman to see the whole of the animal's body at once, but to obtain a general idea of the 'lay of the land' over which the creature moves; in fact it reduces the use of the rifle to the simplicity of the shotgun, so far as the sights are concerned, and after one has used it for a week he is wholly unconscious of its presence, having really nothing to do but hold his front sight on the object.

"Last year I had one of them placed on a .32-caliber, and used it for shooting at the heads of partridges (grouse), after they had been treed by a water spaniel trained for that purpose. During the season I often brought to bag as many as eight to twelve or fifteen birds, and seldom missed more than one head out of a dozen shots.

"In shooting this gun at a reduced Creedmoor target, having a bullseye of 1¼in. in diameter, at 100ft., I have made very many full scores of 10 shots each, and upon one occasion made 192 out of a possible 200, in 40 shots, or an average of 48 out of 50 for four consecutive strings of 10 shots each, the score being as follows: 46, 50, 47, 49.

"With a .44-cal. having this sight, I last year shot, through the head, three loons and an otter, all of them in rapid motion at the time, besides making some of the best shots of my life at deer. One of the latter was killed with a bullet squarely in the back of the head, at a distance of 125yds. and across a river; a second at about the same distance, with a bullet in the ear, while a third was stopped with a broken neck, at 150yds., just as it was about to disappear in the thick woods, the shot being fired from a small boat under considerable headway.

"With this gun I have made many such scores as 48 out of 50, and 66, 68, 69 and 70 out of 75, at 200yds., Creedmoor target, and 94, 96 and 103 out of 120, at the Massachusetts target, using either the plain part of the Beach front sight or the ordinary Winchester sight smoked. Most of this work has been done in the Adirondack woods, in the presence of such reliable men and excellent guides as Sim Tarrence, Fitz Halleck, Ernest and Frank Johnson, Rob Nichols and others, many of whom are now using your sights, and who prefer them to all others where quick work is demanded."

STRING MEASUREMENT.

Editor Forest and Stream:

I note in your issue of Jan. 22, the criticisms of Messrs. James Duane and A. B. Dodge. Thanking Mr. Duane for his complimentary opening, I will endeavor to more clearly define my position on the "dude" target, and string measurement questions. Mr. Duane says, in speaking of Dr. Tolles's target, "if, for instance, the center of the group of shots had been 4in. above the center of the bullseye and 4 in. to the right, I presume the target would have been classed as a 'dude' and treated with contempt accordingly." Most certainly not. In the case he supposes, a full sized diagram of the target would require a circle over 8in. in diameter to inclose the shots. That would not be a "dude" target. Or the circle could be dispensed with, and a cross placed in the proper position to show the center of the bullseye. That would not be a "dude" target. But if the group of shots should be presented with a circle drawn around it, whose center did not coincide with the center of the bullseye, and no mention be made of this important fact, it would be decidedly "dude;" a deception and a snare. If the shooting had been as bad as in the supposed case, a diagram of the target would never, I am sure, have appeared in FOREST AND STREAM. I hope I am understood now. If not, get FOREST AND STREAM issue of Jan. 17, 1884. Turn to page 502, and you will find Maj. H. W. Merrill's article, which I indorsed in a former communication. I am not a convert to Mr. Duane's theory that a small group of shots far away from the center of the bullseye shows as much accuracy in the rifle and skill in the marksman as a group of the same size in or near the center of the bullseye. The object in rifle shooting is to hit something; therefore the correct test of the accuracy (including rifle, ammunition, and skill of shooter) is the string measure. If I shoot at 100yds. range, either for money, badge, or honors, I select the rifle with which I can make the shortest string. That selection in my case would not be a .32-cal., although I well know it has made its groups at both 100 and 200yds. If I was in need of a rifle for target shooting at 100yds. I would not purchase a weapon whose only recommendation was that it would make groups at that distance. Herein I differ from Mr. Duane and Mr. Dodge. I do not speak from a theoretical standpoint. I have made a speciality of 100yds. target shooting for the past three years. During that time I have made very many small groups. These groups were never copied in my score book, unless the string was a good one. A notation was however made, showing the position of the groups, weather conditions, etc. I have seen beginners in rifle shooting make small groups of five or six shots at 100yds., but never saw one make a good string. Mr. John Pennypacker, of Rogers Ford, Pa., put six consecutive shots through one hole at 100yds. several years ago, when he first commenced rifle practice. Each shot enlarged the hole somewhat; but it was very small after the six shots were fired. The rifle was a cheap muzzleloader, and round bullets were used. The rifle was never known to have made a good string. Supposing A and B go to Creedmoor and shoot for a prize. A puts all of his shots in the bullseye, and gets first prize, while B persists in putting his in the left wing of the target and gets "left" of course. And this is just, even though B makes the smallest group. The National Guardsman is classed in marksmanship according to his scores, the value of each shot being rated according to its distance from the center of the bullseye. The marksman (?) who makes a small group in the northeast corner of the target gets very little credit therefor, and this is right. If the prizes and honors were awarded for groups, real marksmen would become scarce in a few years. A mid-range rifle will make a small group at 1,000yds. yet I would not recommend it as being accurate at that distance. The .50-cal. muskets have long since been condemned on account of their lack of accuracy at five and six hundred yards, and yet they will make very small groups at these distance. I need not prove this latter assertion, as it is a fact well known to those who have handled these weapons to any great extent. To illustrate further, and pardon me for dragging into this discussion the much abused Springfield, which to my mind is not nearly as bad a weapon as some claim it to be. Several years ago I was shooting at 500yds. range, using a Springfield .50-cal. and a Burchardt military .45. The wind was strong at 8 o'clock. I had a large signalling disk with short handle. I set it up five feet to the left of the left edge of the target, and aimed at it. Fired the shots alternately, six shots in all, three with each gun. The Burchardt scored 14 points out of a possible 15. The Springfield scored nothing on the target, but made a beautiful group in the mud to the right of the target. I had no one to signal, or I could have done better with the Springfield; but I claim that the Burchardt is the more accurate gun at that distance. I have seen a .45-cal. musket using the regulation Government shell with 420 grain bullet make a group which could be enclosed in a 30in. circle at 1,225yds., but I would not recommend the gun as being accurate at that distance. If I was intending to enter a match at that distance, I would select a gun that I could depend on to put the shots somewhere near the target. I know the true inwardness of this group shooting from a to izzard. I have done much of it.

Five, six, and seven years ago I lived in the country, and had convenient ranges for target practice at all distances up to 500yds. on my father's farm. On neighboring farms I had a range of 800yds.; also all distances from 1,100 to 1,500yds. I had a number of rifles of different makes and calibers, and tested the accuracy of some of them thoroughly. A little Phœnix rifle, .40-50 with round barrel 26in. long, and weighing between 6 and 7 pounds, with plain open sights, would make a group 2ft. wide and 4ft. high at 800yds. At 1,125yds. it made a group 3ft. wide and 7ft. high. At 500yds. it would make a ten inch group, and if I had not shot it beyond that distance I would never have discovered its up and down tendency. I changed my ammunition and got better results, as the following extract from my score book will show: "Feb. 28, 1880, Phœnix rifle, 1,150yds. 5 shots, group in 46in. circle, a 3in. band horizontally across target covers last 4 shots. Last 3 shots in 5in. group. Witnesses Z. M. Savage and Evan Hallman." I shot the Maynard .40-60 mid-range rifle far beyond its accurate range with the following result: "March 2, 1880, Maynard .40-60, naked bullets, 1,200yds., 5 shots, group 32in." These groups were shot under favorable weather conditions. The accurate range of either of these guns is less than one-half of these distances. To show the performance of the latter gun under unfavorable conditions I quote as follows: "March 5, 1880, Maynard .40-60 rifle, 1,250yds. Wind blowing a gale at 4½ o'clock, 8 shots, group about 10ft. high by 14ft. wide. Distance from center of bullseye to center of group 77ft." In this instance the wind drifted the bullets 77ft. to the left of the point at which the rifle was aimed. The question naturally arises, what would have been the drift if the wind had been in the 3 o'clock quarter, instead of between 4 and 5. Referring to my military score book, I find the following: "April 29, 1879, Whitney musket, .45cal., Government ammunition, manufactured at Frankfort arsenal in 1873. 1,225yds., group 40in., 5 shots." "May 13, 1879, Whitney musket, .45cal., 1,300yds., 5 shots, group 34in., 80gr. powder and patched 420gr. bullet." It is a well known fact that special military rifles, using a heavy charge of powder and lead are now considered necessary for match shooting at distances beyond 600yds.

The foregoing examples are sufficient to illustrate my idea of the group question. As a general rule, I think that the distance at which a rifle is accurate enough for match shooting, either in the back position, or from a dead rest, is less than half the distance at which it will make a good group in good weather. Mr. Duane's 200yd. target is an excellent one, It is not a "dude." Its center is plainly marked. Its value as a performance in marksmanship is exactly indicated by its string. It does show the peculiarity claimed for it, none of the shot show any tendency to drop. This shows that the ammunition was carefully and accurately prepared, but does not enhance the value of the target over and above the value as indicated by the string measure. I do not desire to detract one iota from the merits of Mr. Duane's target, but have used it as a handy illustration of the perfect fairness of deciding the relative merits of all targets. The group with a false circle around it is a delusion and a snare, unless it is accompanied by an explanation showing just what it is. Otherwise the unwary will be deceived, and will naturally suppose that the center of the circle was the center of the bullseye, when as a matter of fact the rifle may lack the power to make fair average strings at the distance named. It may be said that my line of argument, if sound, would lead to the adoption of the long-range match rifle for 100yd. target shooting. This does not necessarily follow; inasmuch as the long-range rifle has its drawbacks also, the principal objections being its heavy recoil, which, in the case of many shooters, would affect the accuracy. The expense of the ammunition is an item of no mean importance. If the improved small bores will do the work, there are some marksmen who would

like to know about it. I believe there are many readers of FOREST AND STREAM who would like to know just what the .32cal. rifle will do when put to the severest test, viz., shot from a rest in competition with its bigger brothers. This question not only interests those who find pleasure in shooting at a board, but the game hunter as well. Mr. Dodge quotes me as saying something about the uselessness of group shooting. The words are in quotation marks, but they are not mine. The sentiments expressed are not mine. I believe that group shooting is useful, and quite interesting when done at a range far beyond the distance at which the rifle is known to be sufficiently accurate for match shooting. A marksman of ordinary skill cannot test the accuracy of a first-class rifle at its normal range, for the self-evident reason that the rifle is more accurate than the marksman. He must shoot it way beyond the range at which he wishes to do accurate work. For instance, let us take a short-range rifle, a .32-50, and shoot it at 800yds. in the back position, or from a dead rest. Select good weather for these tests. If there be a defect in rifle or ammunition affecting the accuracy, it will easily be discovered at the long range, as all minor causes which affect the accuracy very slightly at short range, are very much magnified at the long range. The long-range practice is also very beneficial to the short-range shooter. I will admit that a good group is an argument in favor of the accuracy of the gun, but, in my opinion, it is not a very strong or conclusive one. A good string is a stronger argument although not absolutely conclusive, as it might be the result of luck; but a number of consecutive scores made under different conditions of weather, and showing a good average, would, to my mind, absolutely prove the accuracy of the rifle. The scores given by Mr. Dodge are very interesting and instructive. Nothing "dude" or deceptive about them. They are good solid arguments and prove the rifle to be excellent for off-hand work. Mr. Dodge supposes a case in which after firing 10 shots from a rest at 100yds., it is found that the center of the group is ¾ of an inch from the center of the target, and after changing the sights and trying again, the group is found to be half an inch on the other side of the center of the bullseye. He said "the first string would probably measure about five inches. Counted from the center of the original bullseye this is not a fine string in either case," etc Herein I differ from Mr. Dodge. I would call both very fine strings. It may be claimed that this is only a matter of opinion, and this line of reasoning would indicate that Mr. Dodge has seen finer shooting at 100yds. than I have. This is, however, foreign to the question at issue. As to the propriety of drawing the circles around the shots, in one case ⅝ and in the other ¾ an inch from the true center of the bullseye, each reader will judge for himself. The former plan shows the cluster, the latter shows the same and more. E. A. LEOPOLD.

NORRISTOWN, PA., Jan. 26, 1885.

MISSING FIRE.

THE United States Cartridge Co., of Lowell, have recently had their attention called to this subject, and what they say on it will be of general interest:

Complaints are occasionally made by those who have adopted guns and cartridges upon this system, that they are liable to miss fire. Whenever such is found to be the case, the fault is almost invariably in the gun, and generally only in one apparently unimportant part of it, viz.: the striker, or small steel piston that conveys the blow of the hammer to the percussion cap. This striker or piston is often made too short, or without sufficient length of play, or too sharp, or too blunt where it strikes the cap. The end of the steel striker should be rather less than one-eighth of an inch in diameter, and well rounded, so that it may make a deep round indent in the percussion cap, and sufficiently long and free to strike one-eighth inch beyond the face of the false breech, so as to follow the cap and anvil to the bottom of the chamber of the cartridge and ignite it. There is no objection whatever to the striker being of this length.

The main spring need not be very strong, provided that the hammer falls freely upon the piston, but it must be strong enough to make a deep indent in the percussion cap.

The rebounding lock, which brings the hammer to half-cock after the gun is discharged, is liable to miss fire unless the springs are very carefully adjusted, as the blow of the hammer is checked and retarded just as it reaches the percussion cap.

Some guns are made with the striker or piston attached to the lock; this description of gun requires very great care, and at best is very liable to miss fire, the percussion powder receiving a pinch instead of a full blow.

It is very easy to make cartridges that will explode with a slight blow, by placing in them a sharp-pointed anvil resting in a sensitive percussion powder, but cartridges so constructed are extremely dangerous, and many accidents have occurred by such exploding while closing the gun or loading the cartridges. Those manufactured by us are as sensitive in their ignition as it is safe to make them, and if the gun is properly constructed, not one miss-fire will occur in 500 shots.

It is a common argument that because twenty cartridges will explode consecutively, and the twenty-first misses fire, that the fault must be in the cartridge (although probably many of the twenty may have exploded imperfectly). A trifling variation in cartridges made by the million, will occur, either in the chamber, the anvil, the percussion cap, or the flange, and it is easier to make the strikers of one gun the correct length and have hammers giving the necessary blow, than to insist upon an impossible nicety in 1,000 cartridges, coupled with a certain amount of danger to the sportsman.

When the cap has been once struck imperfectly and the copper partially indented, the percussion powder is disturbed and shaken loose; it will then generally fail to explode with many number of blows, and when the cap and anvils are taken out the cap will appear empty, the detonating powder having been pulverized and shaken out through the anvils and flash-hole of the chamber.

If the gun is right, not more than one or two miss-fires will occur in 1,000 shots, and we shall be happy to satisfy any gunmaker that this is the case by allowing him to fire as many cartridges as he may wish, in guns either with the direct or oblique action, that have the strikers and springs correct.

Bursting the metal base of the cartridge at the edge will frequently occur when the chamber of the gun is bored too large, as the metal base is not strong enough to bear the discharge unless supported by the chamber. The gunpowder expands the case until it fills the chamber; and if the space that it is required to fill is too great the case will burst at the edge. Another cause for cases bursting at the edge is in consequence of the gun wearing loose at the joint upon which the barrels are hinged, although the barrels may look close when the cartridge is shut in. The explosion causes the barrel to spring away from the breech, and consequently leaves too great a space for the metal head to expand in. When this is the case it can generally be repaired by the gunmaker making the joint and lever grip sound, so that the barrels are drawn and held firmly against the breech.

RANGE AND GALLERY.

WORCESTER, Mass., Feb. 5.—The scores made by members of the Worcester Rifle Association at Pine Grove Range to-day were as follows:

S Clark	11	11	11	12	11	10	12	10	11	10—109
	10	9	11	9	11	9	10	10	12	10—101
A L Rise	10	10	10	11	11	10	11	10	10	11—103
	11	10	11	7	12	11	8	11	10	10—101
Thomas Leighton	11	9	8	11	10	10	11	12	11	10—103
	10	9	10	9	11	10	11	10	8	11— 99

NEWARK, N. J.—The second gallery tournament for the present winter was held during the past fortnight. The scores made stood as follows:

Frelinghuysen Team.

	Zettler.	Creedmoor
E O Chase	106	45
G D Weigman	110	46
A C Neumann	108	45
J K Walsh	110	47
J L Tobin	105—537	45—228

Celluloid Team.

	Zettler.	Creedmoor
Cole	106	44
Batcheller	80	33
Parberry	90	41
Vreland	105	44
Jackson	100—476	44—206

Domestic Team.

	Zettler.	Creedmoor
W Wadams	106	47
J Long	97	41
J Dainty	111	47
B Jeffreys	113	48
J Reynolds	104—531	43—226

Warren Club.

	Zettler.	Creedmoor
G Freche	100	41
B Germayne	105	44
Wm Nunley	104	46
B Alexander	100	40
W Cheeseman	91—500	41—212

Essex—First Team.

	Zettler.	Creedmoor
Snelling	110	46
E Neil	82	36
J McCullum	104	45
C Meisel	108	45
Coppersmith	107—511	46—218

Essex—Second Team.

	Zettler.	Creedmoor
A Welters	102	40
W Watts	107	45
Carter	97	41
J Bayer	102	43
J Howlett	100—508	41—210

DENVER, Col., Feb. 1.—The following scores were made by the Routt Rifle Team at the Jewell Park Range to-day. This is a commencement of the 500yds. shooting, the majority of the team having never fired at that distance:

200yds., 10 shots—P. M. Lessly 45, Thomas Stone 42, C. J. Kelly 40, Wm. Maguire 39, C. S. Robbins 36, C. H. Sawyer 32, H. A. Collar 23. Total 257.

500yds., 10 shots—Thomas Stone 43, C. J. Kelly 40, H. A. Collar 33, C. S. Robbins 22, P. M. Lessly 13, C. H. Sawyer 12. Total, 163.

BOSTON, Feb. 7.—The attendance at Walnut Hill to-day was much better than the day, for a bad wind from the 11 o'clock quarter prevailed, and high scores were impossible. Very few scores were finished. During the afternoon a match was shot between two teams composed of the members present, and, all things considered, the scores were good. Following are the best scores:

Team Match.—First Team.

R Reed	7	10	7	8	5	0	7	7	6	7—73
C E Berry	5	7	8	6	5	9	10	9	6	4—69
W Charles	7	6	3	8	5	6	9	7	5	10—66
T P Miller	5	9	1	5	7	6	7	9	5	5—58
E S Gilmore	9	1	2	3	7	2	2	3	0	3—32—298

Second Team.

H Cushing	7	9	6	6	7	3	10	8	8	6—71
J Francis	10	3	7	5	9	10	6	9	5	6—70
R Davis	9	5	7	4	4	7	5	7	5	7—60
H E L Bent	5	8	7	6	5	0	4	5	6	7—48
N F Tufts	8	6	8	3	5	5	2	4	4	2—47—296

Creedmoor Practice Match.

E S Gilmore	3	4	5	4	5	4	4	4	4	5—42
J E Darmody (mil)	3	3	3	4	4	5	4	5	4	4—39

Creedmoor Prize Match.

E B Souther	4	5	4	5	5	4	5	5	4	5—46
N F Tuft	4	5	4	3	8	4	4	5	4	5—41

Victory Medal Match.

C E Berry	1	5	10	7	10	8	9	9	3	7—75

Rest Match.

S Wilder	10	10	8	10	10	10	8	9	9	8—92

SAN FRANCISCO, Cal., Feb. 1.—There was a smaller attendance at the Shell Mound Range to-day than there has been for some time. The members of the Pacific Rifle Club were the only shooters who kept the marksmen busy. A few of the scores made in practice were as follows:

	200yds.	500yds.
Vaughn	5544543134—41	5455555545—48—89
Moore	5544445444—43	5544453354—44—87
Kellogg	4555456444—45	4454434245—39—84
Diers	4454453444—41	5445545544—46—86
MacDonald	4445445544—42	4544444445—42—84

George W. Cowing of the Carson Guards, who was the guest of the club at the range, made the following score:

	200yds.	500yds.
George W Cowing	4444545454—43	5555455554—48—91

At 200yds. Kellogg and Hovey each made 45, Johnson made 44, and Moore and Cowing scored 43 each.

SARATOGA, Jan. 31.—The attendance at the range during the past week was fair. Wednesday we had snow and heavy wind all the afternoon, but on Saturday the conditions were good, and some excellent scores were put up. The Massachusetts target was used, the distance being 200yds., off-hand. Score:

T Davis	10	11	11	11	12	11	11	11	11	12—111
W B Gage	11	9	11	11	12	9	10	12	12	12—109
H Wellington	10	12	8	9	12	11	12	12	11	10—107
S F Corey	7	11	11	10	12	12	10	9	11	11—106
L R Rich	12	9	9	12	11	8	11	11	11	12—106
A C Richt	10	9	11	11	11	9	11	7	11	12—104
A F Michell	10	11	11	9	9	10	9	11	12	11—102
W H Gibbs	11	12	12	9	9	9	11	9	10	10—102
F A White	11	11	10	10	7	11	10	11	10	10—101

AVERAGE RIFLE SHOOTING.—What can be called good average rifle shooting at rest and off-hand, is a question that will sometimes puzzle an old shooter to give a definite reply. For the benefit of beginners, I will submit a few rules which practice will prove to be in the main nearly correct, and which, if well fixed in their minds will aid them greatly in arriving at a quick conclusion of what may be called average target shooting. These rules are based on the supposition that a string of 10in. in 10 shots at 100yds. is a fair average performance of a good rifle with improved sights, etc. Taking this as a standard, add one inch to a string for every additional 10yds. up to 200, which would be 15in. at 150yds. or 20in at 200, and for shorter distances deduct one inch for every ten shots, as 8in. for 80yds., 5in. for 50yds., 3in. for 30yds., etc., making an even number of inches for even number of yards. For off-hand work substitute feet for yards, and the same rule holds good thus for 20ft. 2in., 30ft. 3in., 50ft. 5in., 100ft. 10in., etc. Another equally easy way of calculating for off-hand shooting is to keep the centers of 10 successive shots inside of a 2in. ring at 20yds., a 3in. ring at 30yds., a 5in. ring at 50yds., etc. Mr. Cleveland, in his "Hints to Riflemen" says that a marksmen who at 100yds. can put 10 successive shots in a 6in. ring off-hand, need not be ashamed of his performance. Indeed he need not be ashamed but proud of it, for such shooting would make a "full score" possible quite often.—SKEPTIC.

THE NATIONAL GUN ASSOCIATION.

CONSTITUTION.

ARTICLE I.

Name.

THIS organization shall be known and designated by the name of "THE NATIONAL GUN ASSOCIATION."

ARTICLE II.

Capital Stock.

SEC. 1.—This organization shall be duly incorporated under the laws of one of the States of the United States, where there shall be no liability to the stockholder beyond the amount originally subscribed.

SEC. 2.—The capital stock shall be $5,000, divided into shares of $5 each.

SEC. 3.—Each share of stock subscribed, and upon which payment has been made as required under the laws of the State where this Association shall be incorporated, and according to the By-Laws, shall entitle the holder to one vote.

SEC. 4.—The transfer of stock may be made by any stockholder or his legal representative, subject to such restrictions as the Board of Directors shall from time to time make and establish.

ARTICLE III.

Objects.

SEC. 1.—The main objects of the Association shall be:

Firstly—To promote shotgun wing-shooting throughout the United States.

Secondly—To adopt national rules for all classes of shooting at the trap.

Thirdly—To organize annually an International Shooting Tournament.

Fourthly—To organize annually two or more Interstate Tournaments.

Fifthly—To organize gun clubs in various cities.

Sixthly—To publish reports, giving list of members, rules, reports of the years, principal shooting events, etc., announcements for the future, etc., and any matters pertaining to the Association.

Seventhly—To foster and assist tournaments organized by gun clubs, leagues, State or sectional organizations, which may be members of this National Organization.

Eighthly—To secure game preserves for the use of its members.

Ninthly—To promote kind feeling and good fellowship among its members.

Tenthly—And when the reserve treasury fund exceeds the capital stock, said reserve may be devoted to the subsidiary objects of this Association, which shall be hunting, coursing, yachting, fishing and other lawful sports; including the protection and preservation of birds, game and fish, as well as the collection and preservation of specimens of natural history.

ARTICLE IV.

Board of Directors.

SEC. 1.—The affairs of the Association shall be managed by a Board of not more than nine nor less than three Directors, who shall be shareholders, elected by the shareholders at the annual meeting, immediately after which the Board of Directors will meet for the election of officers. In case of vacancies occurring during the year or of non-acceptance of office, the other Directors shall have power to fill vacancies until the next regular annual meeting.

SEC. 2.—The Directors first elected shall divide themselves by lot in three classes of three members each. The first class shall hold their office until the second Tuesday of January, 1888; the second class shall hold office until the second Tuesday of January, 1887, and the third class shall hold office until the second Tuesday of January, 1886; and thereafter at each annual election, to be held on the second Tuesday in January of each year, there shall be elected by and from the Life Members of the Association three Directors, to hold office for three years, to supply the place of the class retiring and for such additional number as may be necessary to fill vacancies, to hold office during the remainder of the terms of the members whose places they fill.

SEC. 3.—Should it happen that, from any cause, the annual election of Directors should not take place in any year on the day herein before mentioned for that purpose, such election may be lawfully held on such other convenient day within six months thereafter as may for that purpose be fixed on by the President and Directors, they causing due notice of said election to be given.

ARTICLE V.

Officers.

SEC. 1.—The Board of Directors shall elect annually from among their members, by a majority vote, the officers of the Association, consisting of a President, three First Vice-Presidents, a General Manager, Secretary and Treasurer, who shall hold office for one year, or until their successors are duly elected, though the duties of two or more of these officers may be combined in one person, excepting those of President and Secretary.

SEC. 2.—The Board of Directors shall also elect Second Vice-Presidents, one for each State and Territory in the U. S., selected from the shareholders of the Association (Article V., Sec. 3). The duties and powers of all officers shall be such as is conferred on them by the Constitution and By-Laws.

SEC. 3.—The Directors shall also have power and authority to appoint such other officers under them as shall be necessary for transacting the business of said institution, and may allow them and all actively employed officers such salaries as they may judge reasonable; to ordain and establish such laws and regulations as may appear to them necessary for regulating and conducting the concerns of said Association, and not being contrary to, or inconsistent with this Constitution and By-Laws and laws of the State where incorporated and of the United States; they shall keep full, fair and correct entries of their transactions, which shall at all times be open to the inspection of the stockholders.

SEC. 4.—No member shall be eligible to the office of President for more than two successive terms.

SEC. 5.—The Board of Directors shall appoint from among its members an Executive Committee of three, of whom the General Manager shall be one, to whom shall be delegated all the duties and powers of the Board of Directors when not in session, excepting as qualified in this Constitution and By-Laws.

SEC. 6.—At any tournament held under the auspices of this Association, all the Directors shall be ex-officio members of the Executive Committee for same.

ARTICLE VI.

Quorum of Directors.

SEC. 1.—At any regular or regularly-called meeting of the Board of Directors three shall constitute a quorum.

ARTICLE VII.

Annual Meetings.

SEC. 1.—The members of this Association shall hold an annual meeting at the main office of the Association on the second Tuesday of January of each year, and such special meetings as may be called pursuant to the By-Laws. If the annual meeting shall not take place at the time fixed, it shall be held as soon after as convenient, and the officers and directors whose terms have expired shall hold over until their successors are appointed.

SEC. 2.—The President and Directors may call a general meeting of the stockholders for any purpose relative to the affairs of the Association.

SEC. 3.—At no meeting of the Association shall any subject be introduced or discussed which does not relate directly to its affairs.

ARTICLE VIII.

Quorum of Stockholders' Meeting.

SEC. 1.—At any meeting of the Association, holders of one-tenth of the capital stock present in person or by proxy shall constitute a quorum, and a majority of votes present only is necessary for the election of any Director, or the transaction of any business of the Association.

ARTICLE IX.

Membership.

SEC. 1.—Membership shall be divided into the following three distinct groups, embracing six different classes, viz.:

SEC. 2.—Honorary Members.—The Board of Directors, by unanimous vote, can confer Honorary Life Membership upon any one. The same shall be entitled to all privileges of Annual Members, with the exception of the right to vote or hold office, and they shall not have any interest in the property of the Association.

SEC. 3.—Life Members.—Every individual holder of five shares ($25) of stock shall be a Life Member of the Association, free from all other dues, entitled to all the privileges of Annual Members.

SEC. 4.—Annual Members.—Any reputable citizen can become an Annual Member of the Association (subject to the vote of the Board of Directors or Executive Committee). Initiation fee, $5; annual dues, $1, payable May 1. Any one holding an original share of the Association, viz., $5, need not pay any initiation fee to become a member; he becomes an Annual Member by paying $1 annually, though he does not lose his stock by failing to pay his annual dues, in which event he becomes an inactive stockholder merely. When the original shares are all subscribed the initiation fee of $5, required from subsequent members, is forfeited when the annual dues are not paid.

SEC. 5.—Club Membership.—Clubs and Associations already organized, or which may be organized without any assistance from National Association. Initiation fee, $3 per member; yearly dues, $1 per Annual Member.

SEC. 6.—Club Membership.—Clubs organized under auspices and aid of the National Association. Initiation fee, etc., same as Class 3.

SEC. 7.—State Association or any sectional organization Membership.—When organized and consisting of at least three clubs. Initiation fee, $2 per member; yearly dues, $1 per Annual Member.

SEC. 8.—Any person giving his name, age, address and the name of the organization (if any) with which he is connected, shall, upon paying to the Secretary the initiation fee and yearly dues, become a member of the Association, subject to above vote, and any club or association giving a statement of the time of its organization, the name of its present officers, the number of members, and paying the prescribed fees to the Secretary, shall become a member, subject to above vote.

SEC. 9.—The President of the United States, the General commanding the Army of the United States, the Governors of the States and Territories of the United States, the Adjutant General and Chief of Ordnance of the United States, and the Adjutant-General of the various States and Territories of the United States, shall be Honorary Life Members of this Association.

SEC. 10.—Whenever a gun club or association shall be formed in any of the States or Territories which shall join this Association as a body, the President thereof shall be an honorary Life Member of the Association.

ARTICLE X.

Rights of Members.

SEC. 1.—Annual members only shall be allowed to shoot at tournaments held under auspices of this Association.

SEC. 2.—Annual members will be allowed to shoot at any tournament held under the auspices of any club or association receiving any prize or assistance from this Association in managing said tournament.

SEC. 3.—Annual members will be allowed to shoot at any tournament held under the auspices of a club or association which has been founded under the auspices of this Association.

SEC. 4.—Annual members will be allowed full privileges of using the main office of this Association and of any club rooms, etc., which the latter may establish.

SEC. 5.—Annual members only will be allowed to wear the badge of this Association, which shall entitle the wearer to enter gratis the grounds where any tournament is in progress, under the auspices of this Association.

SEC. 6.—Annual members only shall be entitled to the printed reports of this Association gratis, which shall embody the Constitution and By-Laws of this Association; the national shooting rules; latest legal decisions, announcements, etc.

SEC. 7.—Annual members only will be allowed to appeal to the Committee on Grievances, on Rules and on Law, for the settlement of any and all controversies—thus obtaining the benefit of "a court of last resort," which shall interpret the shooting rules adopted by this Association and whose decision shall be final.

SEC. 8.—Owners of capital stock only shall be entitled to the annual dividends accruing from profits of tournaments, etc.

SEC. 9.—Owners of capital stock only shall be entitled to vote at election of directors and at annual meetings.

SEC. 10.—No member shall be allowed to transfer his rights of membership, excepting holders of capital stock.

SEC. 11.—All rights and interests of a member in the property and privileges of the Association shall cease with the termination of his membership, excepting interests in the property by the holders of capital stock.

SEC. 12.—Associations or clubs being members shall be entitled to have the names and addresses of their officers for that year, and the scores made during the year at its two principal matches, to be certified as correct by its secretary, published in each annual report of this Association; and also

SEC. 13.—To receive the bronze medal of this Association, for competition among its members, in such manner as it shall prescribe.

SEC. 14.—Any member having complaints or suggestions to make as to the management of the Association, must do so in writing to the Secretary, to be submitted to the Board of Directors.

SEC. 15.—No member shall take any property whatsoever belonging to the Association from its rooms or grounds, except on the authority of a resolution of the Board of Directors or Executive Committee.

SEC. 16.—Any member wishing to resign shall make his resignation in writing to the Secretary.

ARTICLE XI.

Penalties of Members.

SEC. 1.—Members in arrears for dues or fines, or any member who shall neglect to pay any indebtedness to the Association on demand, shall forfeit his or their membership (by majority vote of Board of Directors or Executive Committee) in the Association, and cannot be reinstated in such membership except by vote of Board of Directors and payment of all arrears.

SEC. 2.—Any member who shall have violated any of the rules of the Association may be fined, by majority vote of the Board of Directors or Executive Committee; or any member whose conduct shall be pronounced by vote of the Board of Directors or Executive Committee to have endangered, or to be likely to endanger, the welfare, interest or character of the Association, shall forfeit his membership; but such vote shall not be taken without giving two weeks' notice to the offender of the charges made against him, and affording him an opportunity to be heard in his defense. No per-on so removed shall be eligible for membership unless his disability is removed by a similar vote.

SEC. 3.—Any member of the Board of Directors who shall in its opinion conduct himself in a manner seriously prejudicial to the interests of the Association, may be removed from the Board of Directors at any stated meeting, provided the member accused shall have been at least ten days previously personally notified in writing of the charges against him, and a hearing given him thereon at a stated meeting to be therein specified. But such removal can only be effected by the affirmative vote of at least two-thirds of all the members of the Board.

ARTICLE XII.

Dividends.

SEC. 1.—The President and Directors shall declare such dividends of the profits of the business of the Association as shall not impair, nor in any way lessen the capital stock of the same. The dividends shall be made yearly, in January, and shall be paid to the stockholders within ten days thereafter, but no dividends shall be paid to any stockholder whose stock is delinquent.

ARTICLE XIII.

By-Laws, Rules, etc.

SEC. 1.—This Association shall have the power to make such By-Laws, rules and regulations, for its officers and members, describing their duties and limiting their powers, and take such action for the protection of its property and the promotion of its objects as may be deemed necessary and expedient.

SEC. 2.—The By-Laws may be altered at any regular meeting of the Association by a two-thirds v te, notice in writing of the intended change having been given at the preceding regular meeting, but the operation of any By-Law may be suspended during a meeting by the same vote without notice.

ARTICLE XIV.

Seal and Badge.

The Board of Directors shall adopt a corporate seal for the Association; they shall also adopt a badge to be worn by members of the Association.

ARTICLE XV.

Altering Constitution.

This constitution shall be changed only at an annual meeting, notice in writing or by publication having been given of the intended change, or such alteration and a-endment may be made without previous notice by a unanimous vote of the stockholders present.

BY-LAWS.

ARTICLE I.

Board of Directors.

SEC. 1.—Meeting of Directors shall be held quarterly at the office of the Association on the second Tuesday of January, April, July and October at 2 o'clock P. M. Special meetings may be called by the President or General Manager, such call specifying the object of the meeting.

SEC. 2.—In attending an annual meeting only, shall the necessary traveling expenses of the members of the Board of Directors be paid by the Treasurer. Any member of the Board of Directors shall be entitled to the same privilege and remuneration as is allowed the Second Vice-Presidents per Article VI. of these By-Laws.

SEC. 3.—In the absence of both President and Vice-Presidents from any meeting of the Association, any member present may be selected to preside.

SEC. 4.—The Board of Directors shall have charge of all the property, effects and assets of the Association, excepting as qualified in Constitution and By-Laws, and shall have the management and control of the same, and exercise a general superintendence of its interests and affairs; they shall make all necessary contracts and purchases in the name of the Association, which are necessary to carry out the provisions of this Constitution, excepting as qualified in Constitution and By-Laws, but shall have no power to make the Association liable for any debt beyond the amount of money which shall at the time of contracting such debt, be in the Treasurer's hands, and not needed for the discharge of prior debts or liabilities, or of those created by the Association. They shall have power generally to do all things which may be necessary for the proper management of the concerns of the Association.

ARTICLE II.

Subscriptions to Capital Stock.

SEC. 1.—The subscriptions to the stock shall be made payable as follows: 10 per cent. at time of subscription, and thereafter in monthly installments of 20 per cent., payable on the first of each ensuing month to the Secretary or Treasurer of the Association if one share only be subscribed, or 10 per cent. if more than one share is subscribed; scrip receipts shall be issued therefor, the shares not being issued until the full value is received.

SEC. 2.—Any stockholder neglecting or refusing to pay an installment in whole or in part when required, the President and Directors may sell or dispose of such stock, and after deducting the expenses of such procedure, shall pay over to such stockholder any excess which may remain.

ARTICLE III.

Duties of President.

SEC. 1.—It shall be the duty of the President to preside at all meetings of the Association and of the Board of Directors, and to maintain order, enforce the rules and regulations, and to perform such other duties as usually pertain to the office of president of an association. He shall have the power, whenever he deems it necessary, to call special meetings of the Board of Directors. And he shall call special meetings of the Association whenever directed so to do by holders of one-tenth the stock thereof, and of the Board of Directors whenever directed by three of the members thereof, said notices to be in writing. He shall countersign all stock certificates, contracts, etc.

ARTICLE IV.

Duties of First Vice-Presidents.

The First Vice-Presidents shall act in the place of the President, in the absence of the latter from the meeting of the Association, in the order of seniority of election.

ARTICLE V.

Duties of Second Vice-Presidents.

The Second Vice-Presidents shall constitute a Committee on Organization for their respective States and Territories, whose duty it shall be to promote the interests of the Association in their respective States and sections; to canvass the same for members, a commission being allowed them of ten per cent. of the membership fee (payable when the latter has been paid in full), for each member they may induce to join the Association or to send their subscriptions through said Second Vice-President. Their traveling expenses incurred for the latter object or in the interest of the Association, having previously been authorized by the General Manager, shall be duly paid by the Treasurer. At any tournament given under the auspices of the Association, they shall be ex-officio members of the Executive Committee for same.

ARTICLE VI.

Duties of General Manager.

SEC. 1.—The General Manager shall be the Chief Executive Officer to carry out the objects of the Association. He shall execute the orders of the Board of Directors and Executive Committee, and in the absence of the specific instructions of the latter in carrying out the objects of the Association, he is authorized to proceed as he deems best, but he shall incur no expenditure exceeding $50, without the authority of the Executive Committee or the Board of Directors. He shall receive such salary as the Board of Directors may annually fix. He shall appoint such subordinate officers as he deems requisite in managing any tournament. He shall appoint such subordinate assistants as he may deem requisite to assist in conducting the business of the Association, subject, however, to the approval of a majority of the Executive Committee or of the Board of Directors

SEC. 2. All the duties and powers of the Executive Committee when not in session, or when not accessible within reasonable time, shall be exercised and discharged by the General Manager. He shall have power, whenever he deems it necessary, to call meetings of the Board of Directors. He shall also make all contracts subject to the approval of the Executive Committee. He shall make all purchases and report the same when made to the Secretary.

ARTICLE VII.

Duties of Secretary.

SEC. 1. The Secretary of the Association shall notify each member of the Board of Directors of all its meetings, and each member of the Association of every meeting of the Association; issue all other authorized notices to members; make and keep a true record of all meetings of the Directors, the Association and the Executive Committee; have custody of the books and papers and corporate seal of the Association, and conduct all correspondence, and give timely notice to the Directors at their regular meetings of all annual reports required to be made. He shall notify applicants for membership of their election, and perform such other duties as may appertain to the recording secretary of an association. He shall, in January of each year, make an inventory of the property of the Association, with the estimated value thereof. His books shall be open for inspection at both regular and special meetings of the Association.

SEC. 2.—He shall keep the books of the Association, including the books of the Treasurer, should the latter so elect, and balance the same up to the first days of June and December, and oftener, if required; shall lay before the Directors, at their quarterly meetings, and at other times when required, a full statement of the condition of the Association; shall receive and collect money, and deposit the same with the Treasurer to the credit of the Association, and shall perform such other duties as may be required of him.

SEC. 3.—The Secretary shall keep the accounts of the members, receive all moneys due the Association and pay the same over to the Treasurer, taking his receipts therefor. He shall draw orders on the Treasurer for all bills ordered to be paid by the General Manager, Executive Committee or Board of Directors; such orders, however, shall be countersigned by the President. He shall give notice to members in arrears, and shall make a special report of all members who are six months in arrears, that action may be taken thereon, as per Article XII of the By-Laws.

SEC 4. He shall charge 25 cents for each new certificate issued in making transfers of stock.

SEC. 5.—He shall sign all stock certificates and affix the corporate seal thereto, and shall receive such salary as the Board of Directors may fix.

ARTICLE VIII.

Duties of Treasurer.

SEC. 1.—The Treasurer shall receive from the Secretary all moneys, and pay them out only on an order of the Financial Secretary, countersigned by the President. In case any money is received by him direct, he shall notify the Secretary accordingly. He shall make a detailed report of his accounts at every regular meeting, or whenever required to do so by a vote of the Association or the Board of Directors. He shall also make an annual report to the Association at its annual meeting.

SEC. 2.—The Treasurer shall give bond in the penal sum of Five Thousand Dollars, with security to the Board of Directors, conditioned faithfully to account for and pay over all moneys which may come into his hands, and for the faithful performance of all the duties of his office. He shall receive such salary as the Board of Directors shall determine.

ARTICLE IX.

Duties of Executive Committee.

SEC. 1.—The Executive Committee shall have general supervision of the finances of the Association. They shall from time to time credit all bills, examine the accounts of the Treasurer, and keep themselves informed of the financial condition of the Association. To this Committee shall be referred the Treasurer's reports, and all questions and propositions relating to finances, and no obligations of the Association beyond those necessary for current wants shall be made until the Committee have considered and reported upon the necessity and propriety of the plan proposed.

SEC. 2.—The Executive Committee may fix periods for its regular meetings, and may be convened upon the written demand of any member.

SEC. 3.—All the powers and duties of the Board of Directors not herein delegated to the officers or to other committees shall be exercised and discharged during the recess of the Board by this committee.

SEC. 4.—Two members shall constitute a quorum.

SEC. 5.—They shall keep regular minutes of their proceedings, which shall be recorded in a book kept for that purpose in the office of the Association, which shall be reported to the Board of Directors after having previously been approved by the committee.

SEC. 6.—They shall take cognizance of all infractions of the By-Laws, Shooting Rules, conduct unbecoming a member, etc., in the intervals of Directors' meetings.

SEC. 7.—They shall select and procure the prizes offered by the Association.

SEC. 8.—All the acts of the Executive Committee shall be binding upon the Association, unless disapproved by the Board of Directors at a regular meeting.

ARTICLE X.

Membership.

SEC. 1.—Whenever any person shall be proposed for Annual Membership, written application must be made to the Board of Directors, through the Secretary, subscribed by him, setting forth the name and place of residence of the person proposed (the initiation fee paid to the Secretary), and upon their majority vote, favoring his admission, the Secretary shall notify him of his election.

SEC. 2.—Honorary members may be elected upon their names being proposed and acted upon in the mode prescribed for annual members, a unanimous vote being required. They shall not be required to pay an entrance fee, and shall be entitled to all the privileges of active members, with the exception of the right to vote or to hold office, or to have any pecuniary interest in the property of the Association.

SEC. 3.—Non-members may be allowed the privileges of annual members, under such restrictions as may be fixed by the Board of Directors, Executive Committee, or General Manager.

SEC. 4.—It shall be the duty of members of the Association to conform to all requirements of the Constitution and By-laws, Rules and Regulations.

SEC. 5.—Members shall notify the Secretary of any change of their residence or place of business.

ARTICLE XI.

Resignation.

Any member may resign from the Association by giving notice in writing to the Secretary, but no resignation shall be accepted if the member be in arrears for dues, or otherwise. Upon the acceptance of such resignation, all interest in the property of the Association of the member resigning, or in any manner ceasing to be a member, shall be vested in the Association, excepting as indicated in the Constitution.

ARTICLE XII.

Penalties.

SEC. 1.—Any member failing to pay his dues or fines shall be liable to expulsion, and when six months in arrears, his name shall be brought before the Executive Committee or Board of Directors for such action as they may direct.

SEC. 2.—Any member of the Association may be expelled, forfeiting all rights in the property of the Association, for conduct unbecoming a gentleman, at any meeting of the Executive Committee or Board of Directors upon a majority vote of the members present; provided any such member who may be charged with conduct deserving expulsion shall have fourteen days' previous notice of charges to be made against him at such meeting, together with a copy of the charges against him, at which meeting he may be present and meet the charges so preferred against him, and shall be entitled to be heard.

SEC. 3.—Any member causing any injury to the property of the Association shall have the same repaired, and should he neglect forthwith to do so, the Board of Directors or Executive Committee shall cause the same to be done, and direct the Secretary to charge the expense thereof to the offending member.

SEC. 4.—No game of any kind shall be played for money at any time in the Association rooms under penalty of expulsion by the Executive Committee.

SEC. 5.—No member shall take any book or other property of the Association without permission of the Executive Committee or General Manager.

SEC. 6.—No Director shall divulge to persons not members of the Association, any of its transactions.

SEC. 7.—All dues, fines and penalties shall be charged upon the books of the Secretary, and can only be remitted for cause shown; and at a meeting of the Board of Directors or Executive Committee.

SEC. 8.—Any active member in arrears for dues or fines shall not be entitled to vote at an annual election.

ARTICLE XIII.

Residuary Powers.

All matters not particularly provided for in the Constitution or By-Laws, shall be controlled by the Board of Directors or Executive Committee until specially passed upon by the Association at any meeting.

ARTICLE XIV.

Shooting Rules.

The Board of Directors shall appoint committees on shooting rules and adopt shooting rules for all classes of shooting at the trap, and for managements of tournaments, which shall be submitted for the approval of members at the first annual meeting thereafter; and which can subsequently be amended only at future annual or other members' meetings.

ARTICLE XV.

Upon the appearance of a quorum at the time appointed for any meeting of the Board or of the Association, the meeting shall be called to order, and proceed in the following

ORDER OF BUSINESS.

1. Calling roll of members present.
2. Reading minutes of last meeting and of previous minutes not passed on.
3. Reports from officers, standing and select committees.
4. Motions and resolutions.
5. Election of members.
6. General business. Adjournment.

THE TRAP.

TIME-SHOOTING.—Meadville, Pa., Feb. 6.—*Editor Forest and Stream:* At the old fair ground, Feb. 4, Otto Wilkins lowered the record in time shooting, with shotgun, 100 glass balls, breaking them in 2min. 27sec. It was a very disagreeable day for shooting. A cold rain set in about 2 o'clock and continued the rest of the afternoon. The balls were thrown into the air 30ft. from shooter. The score was 116 shots and 100 hits. First 25 broken in 34sec., second 25 in 37sec., third 25 in 37sec., fourth 25 in 36sec.—H. C. K. Cincinnati, Feb. 6.—Frank C. Mustin, a young man well-known here, and although the youngest shooter in our city, is an expert with the rifle. Thursday afternoon he broke 115 composition balls, thrown in the air, in 9min. and 15sec. He shot at 123, missing 8, using a .22 caliber single Stevens rifle, loading his own gun and cleaning once. The balls were thrown in the air at 12ft. rise. I am an old hand at the business, and never saw so many broken in that space of time.—JOHN SCOFIELD.

NARRAGANSETT GUN CLUB, Jan. 29, 1885. Match at clay-pigeons, 18yds.:

C O Gray	11111 00101 10101 10110 11111 01111		—22
W H Sheldon	11010 01101 11101 11001 01110 01111		—20
J Congdon	10010 00111 11101 10011 11101 11101		—20
E W Tinker	11011 10110 01110 10111 11001 011 0		—19
P Randall	10110 01001 11100 10110 01001 10010		—14
O G Harris	00030 10100 01101 00000 11011 01010		—14
C H Brown	10001 11101 11010 00110 00110 00000		—13
A W Rounds	00001 11001 10001 11000 01110 00101		—13
C F Harris	00000 10110 00000 11111 00010 01011		—12
M Parker	01010 10000 01000 00010 00111 11000		— 9
Geo. Cary	10010 11011 11001 w.		

Twenty-one yards: tie for second, Sheldon 11000—2, Congdon 01000—1. C. C. Gray won first prize, 1000 wads. W. H. Sheldon won second, 500 shells, and E. W. Tinker won third, one-half dozen napkin rings. The weather was so intensely cold that the shot froze together in a solid mass after leaving the guns. This will probably account for some of the many misses made, as I can think of no other good excuse.—W. H. S.

NORTHSIDE GUN CLUB.—Regular monthly shoot at Woodside, L. I., Feb. 4, 25yds., except Chevallier, who shot at 27:

Chevallier	1101111—6	Manning	1011100—4
Stocky	1100010—3	Tapken	1111001—5
Krumbeck	1110001—4	Lennon	0011001—3
Whalen	1011011—5	Lyon	1011111—6
Goetting	1101111—6	Skelton	0110001—3
Evers	1110111—6	Eberhardt	1110011—5
D Franz	1100101—4	Pfaender	1111111—7
Kroger	0110011—4		

NEPTUNE GUN CLUB.—Last Thursday, Feb. 5, a large number of the prominent citizens of Asbury Park were on the grounds of the Neptune Gun Club to witness the club's first pigeon match. The conditions were 21yds. rise, single birds, the prize a gold badge. The score:

C Borden	11101—4	S O Rogers	01111—4
M Boice	00111—3	W Kelsey	01111—4
J L Cliver	11101—4	B Heyman	01011—3
T Emmons	01010—2		

In shooting off the ties, miss and out, J. L. Cliver won the badge. C. Borden 5, J. L. Cliver 6, S. O. Rogers 1, W. Kelsey 1.

BARRETT VS. VON LENGERKE.—A match that has caused considerable excitement among the Jersey trap-shooters for some time has finally been arranged and definitely settled to come off on the 23d inst., at the grounds of the Short Hills Athletic Club, New Jersey, between Mr. Barrett, a noted field shooter of that vicinity, and Mr. J. Von Lengerke, of Jersey City. The match is for $300, at 50 live birds each, 25yds. rise, 5 ground traps; guns to be of less than 7½ pounds' weight. As both contestants have large local reputations and many friends, the interest continues to increase and considerable money will probably change hands.

BOGARDUS—MEADERS.—New Orleans, Feb. 8.—The first of two matches for $250 a side, between A. H. Bogardus and Andy Meaders, of Nashville, Tenn., was shot yesterday. The match was at single birds, 18yds. rise, and the score stood 85 for Bogardus and 92 for Meaders. Time, 1:20. To-day the contest was continued at double birds. Bogardus scored 91 and the latter 81. Last night's match left Meader 7 ahead, and to-day's shooting gives the $500 stakes to Bogardus by a score of 8.

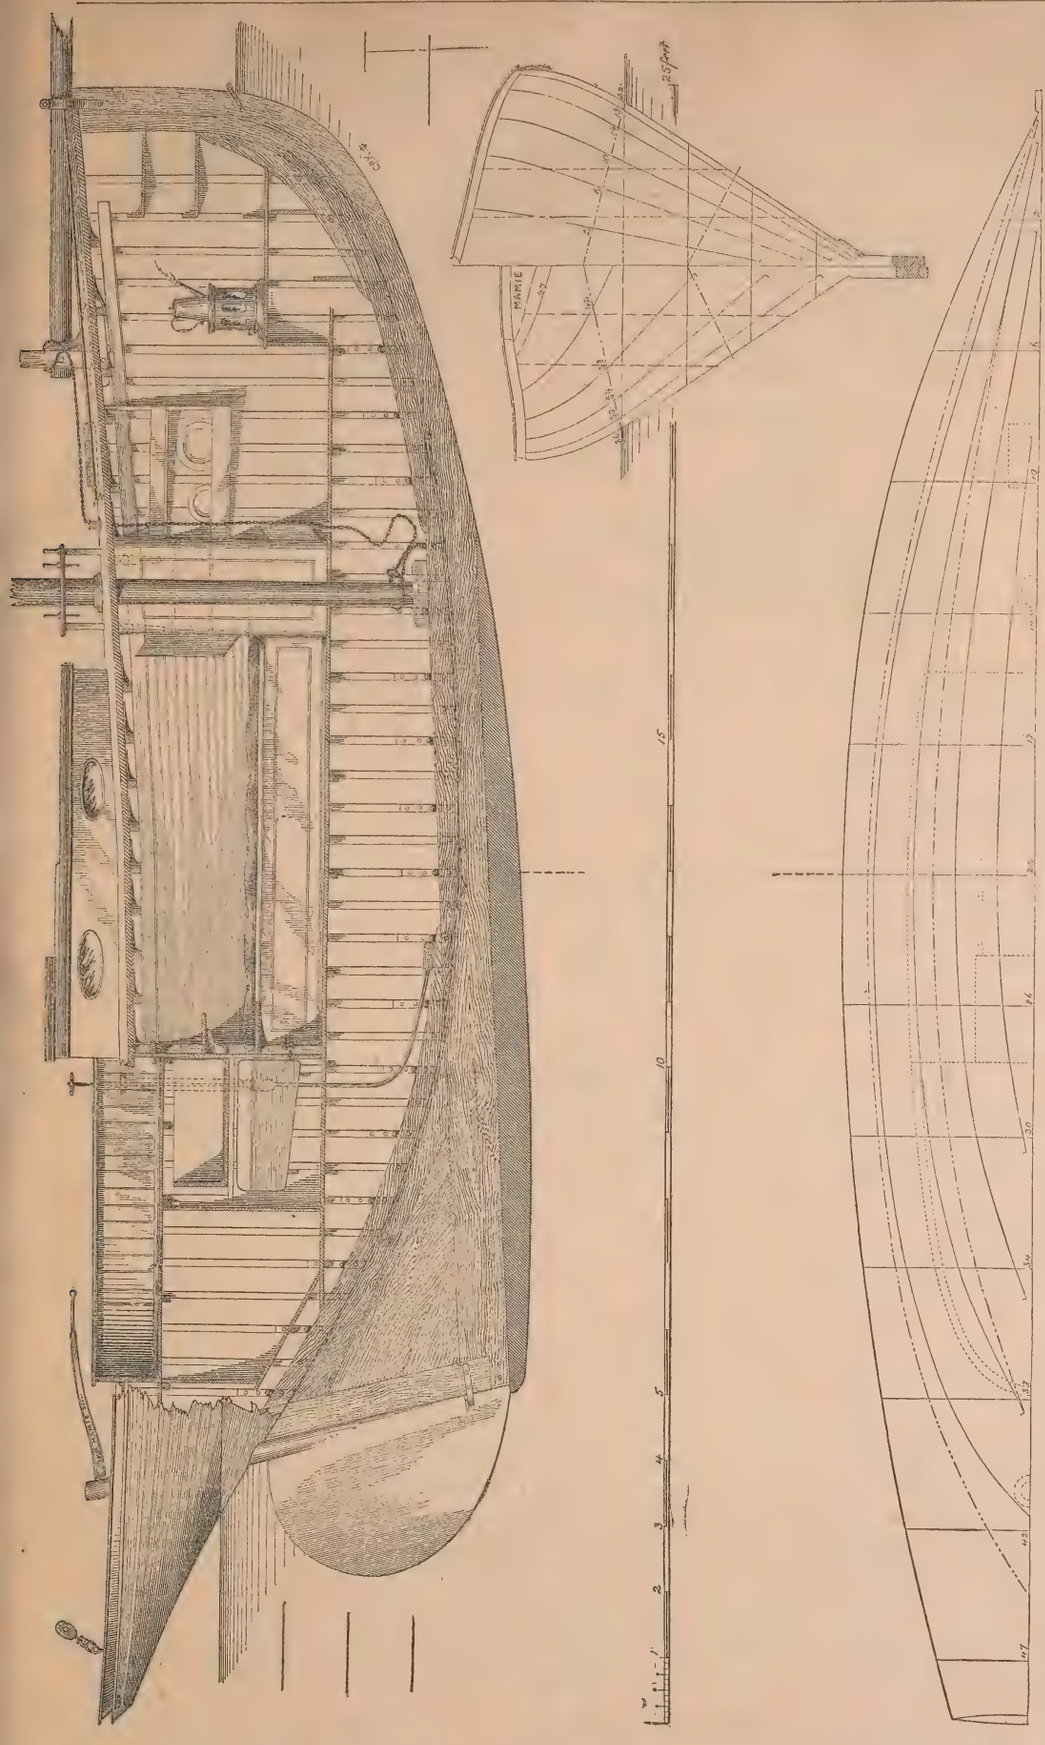
MANCHESTER, N. H., Feb. 4.—The fortnightly shoots of the Manchester Shooting Club are constantly attracting more attention, and the interest in the competition for the club's gold medal intensifies. The weather conditions this afternoon were fairly good, and Messrs. Wadleigh and Durgin made a close race for the medal, the latter winning it by a single point. The scores made were as follows:

E A Durgin	1011101111111001111—16
M Wadleigh	1011011111111001111— 15
C B French	0111001011101001011—12
C E Gove	1010010110111100011—12
G Carver	0001111110000010111—11
H Gray	1101011010010010010— 8
M E Gerry	1100100100000100 w— 1

TORONTO, Feb. 5.—The pigeon match between J. Townsend, of Toronto, and George Rogers, of St. Catharines, came off at the Woodbine track this afternoon. The match was 50 birds a side, Toronto Gun Club rules to govern, 21yds. rise, 21yds. boundary. There was considerable interest taken in the contest, both men apparently being evenly matched. The birds were flyers without a doubt, and the scores were good considering the day, the cold wind blowing from the northwest, which made it anything but pleasant to the shooters. The following is the score, which will show how evenly both are matched:

J Townsend	0011001011011011111111111111111111111111111111—40
G Rogers	1011101111101011011111010111001101111111111111—40

It is not decided when the tie will be shot off, as birds are very scarce.



NEW ORLEANS, Feb. 1.—There was a large crowd at the Wild West Park to-day, to see the clay-pigeon and bat sweepstakes shooting match for a silver cup offered by Capt. A. H. Bogardus. The following are the entries and scores made:

Clay pigeons.	Bats.	Clay-pigeons.	Bats.
Cousin	1010101011-6	1010111001-6	Chaudet	1011111110-8	1111111110-9
Cody	1010110011-6	0001111101-6	Ruble	1111001111-8	1100110100-5
Furentes	1011111010-7	0001010001-3	Hancock	1011101010-6	0110001101-5
Cook	1001101001-5	1111000111-7	Clocher	1111110010-7	0001110110-5
Memurdo	1110001011-6	1101110010-6	Boulder	0001111101-6	0001000000-1
Leche	0100011010-4	1101001111-7	Parker	1110001110-6	1101010000-4
Lovett	0001011111-6	1111101011-8	E Bog'dus	1101101111-8	1110110101-7
J Lovett	1111111111-10	0111101100-6	Mayronne	1110101111-8	1111100111-8
Tubiger	1011000011-5	1100011110-6			

The cup and first money was won by L. P. Chaudet. Second money won by William Mayronne. Third by Eugene Bogardus. It was quite late at the conclusion of this match, and Capt. Bogardus shot at twenty single pigeons and ten pair of double pigeons. His score was nineteen out of twenty singles and eighteen out of twenty double.

PUBLISHER'S DEPARTMENT.

One of our well-known New York seed firms have now on deposit in the Mercantile Safe Deposit Company's vaults four hundred pounds of Henderson's snowball cauliflower seed, which at the selling price of one hundred dollars per pound, shows the value of this seed to be forty thousand dollars. Not only is this plan of depositing in vaults found to be cheaper than insurance, but what is of more importance is that if the seed should be destroyed by fire this quantity necessary for their trade could not be replaced at any price in time for the spring sales. When it is considered that four hundred pounds of cauliflower seed will, under favorable conditions, produce nearly thirteen million plants, which when headed for market and sold at even eight cents per head will produce the sum of three quarter of a million dollars, the value this vegetable has attained in this country, where twenty-five years ago it was almost unknow, becomes readily apparent.

Yachting.

FIXTURES.

June 12—New York Y. C., Regatta.
June 20—Hull Y. C., Pennant Matches.
July 11—Hull Y. C., Cruise.
July 18—Hull Y. C., Club Race.
July 25—Hull Y. C., Ladies' Day.
Aug. 1—Hull Y. C., Club Race.
Aug. 15—Hull Y. C., Open Race
Sept. 5—Hull Y. C., Champion Race.
Sept. 19—Hull Y. C., Champion Race.

TO DEFEND THE CUP.

COMMODORE James Gordon Bennett has cabled to Mr. W. P. Douglass to commence at once the building of a large centerboard sloop. Mr. A. Cary Smith is to furnish the design. Length on load-line 84ft., beam 23ft., draft 8ft.

A NEW REEFING GEAR.—We have received from Commodore A. J. Prime, of the Yonkers Y. C., a sketch of Mr. Fearon's new reefing gear for jibs, and will illustrate it shortly. This gear will be fitted to three new catamarans now building by Mr. Fearon.

FIRST OF HER KIND.

IT will be remembered that when the lines of the proposed Fendeur, originated by Mr. R. C. Hopkins, were first published in these columns in February, 1883, a great deal of comment ensued. Some of the opinions expressed were highly favorable, others took the opposite side and could not see how a boat of triangular section could stand up. Mr. Hopkins tried a model on his lines with considerable success, as reported at the time; but for private reasons the actual construction of the Fendeur was delayed for the time being. This left the question an untried venture, until taken up by Mr. E. L. Williams, of Lowell, Mass. As a builder of shell boats, Mr. Williams had met with much success in shaping his boats all from one and the same mould, simply turning it up higher and higher for successive frames. From the outset he took great interest in the Fendeur, which seemed to strike in a similar vein of thought. Last spring, he laid the keel for the first of the breed, tried her thoroughly during the season, and late last fall sold the boat to Mr. A. Wheelwright, of this city. A great deal of credit should be given to Mr. Williams for his enterprise and good judgment in a field not yet prospected. The Mamie, whose lines and interior are herewith illustrated by handsome cuts extracted from the new book on "Small Yachts," soon to appear, turned out so satisfactory, that Mr. Williams has since established himself as a yacht builder in South Boston, with the object of constructing similar boats.

It is now pretty well understood that successful yacht building should be divided into two great chapters, which have little in common with one another. First, the design. Second, the practical construction. Excellence in both is necessary to insure the best performance, and neglect in either division will be visited with corresponding shortcomings in the behavior of the boat. We are led to these remarks to save hasty critics overrunning their reckoning should they inspect the Mamie, now hauled out at Frank Bates's yard, South Brooklyn. This boat, being purely experimental, the builder could not afford to risk his funds in aiming at the most favorable build, but rather sought to confine outlay in cash to the narrowest limit possible, for this would all have been sunk had Mamie proved a failure. Hence, in the details of practical construction she falls short, and loses much which might have been drawn upon to her advantage. Of this the builder was aware, and his next promises to be superior in many ways.

In spite of these drawbacks the Mamie has shown herself a very likely craft at all times, justifying further similar undertakings. As an example, her keel consists simply of 4in. flitch and consequently but little outside ballast could be hung thereon. Had it been a 6in. balk, with the rabbet near the lower edge, the wood projecting inside instead of outside the garboards, nearly three times the weight of iron could have been bolted underneath and rig increased to correspond. Again, the ballast inside is composed of scrap. But if cast to fit would be much lower and afford 8in. or 1ft. more head room. We hear that lead may be substituted this spring and this alteration put into effect. In point of type Mamie is a straight framed cutter with the addition of a shoulder above water. Her bottom, though odd at first sight, differs in reality but little in the frames from a deep cutter. The slight hollow in the floor and the usual round of the bilge have simply been straightened out, a very trifling divergence in form from many an existing and successful cutter. In the forward and after frames, this difference is so small as to amount to scarcely more than an idea. Hence, we are right in looking for much the same performance as in ordinary boats of like general proportions. But the main distinction between the Mamie and regular cutters lies not in her bottom, but in the topsides. From loadline up the Mamie approximates the usual sloop form. She has very nearly a cutter's bottom and a sloop's topside. A compromise more truly than the so-called compromises which are only deep and heavy sloops and partake of sloop qualities all through.

For her performance the writer must draw upon report, not having had the chance to test her in person. Report speaks well of her, and in just the way the boat's form would lead one to expect. With the weight and fine lines of a cutter below, she is a steady boat of great ease, holding her way through a sea and also in light, variable winds, owing to great momentum and small resistance. With the low weight and flaring but easy roundish topsides, she is notably stiff after once heeling down to her "sticking point," which seems to be about plankshear-to in good sailing breeze. Beyond this angle she resists. Likewise does she rise to a head sea with much life, as plenty of bulk above water has been provided and the flare all round prevents her dropping deep into a hollow. She is specially dry, throwing no spray, but dipping a little harmless water over the lee bow when pressed in lumpy surroundings. Her motion is not hard and quick, but the reverse, rendering a long cruise an agreeable pastime in place of jerking athletics to preserve one's balance. She is light on the helm and certain in stays in rough water, also free from yawing when running wide. As to speed, her official trials have not so far been very exacting. Two matches were sailed in Eastern waters. One of them, under the flag of the Salem Bay Y. C., saw Mamie lift the ducats in good style, and the other failed for want of wind. Her builder tried her in scrub races and thinks her fast. After her advent in New York waters last fall she was under way only twice before going on the mud for the winter, but her present owner considers that, so far as he could judge without competitors alongside, the Mamie gave promise of very fair speed. Her exact status as a racer, when tried high, we may leave for the coming summer to determine. But it can be said with certainty that Mamie is not a slow boat, and at least up to the average. Allowing for a more advantageous stowage of weight, and there is reason to believe she or a similar boat will make her mark in the records.

No doubt the broad question will at once be asked: "What advantage is there in the style?" Leaving speed out as not fully settled, the answer would be that Mamie attempts to combine certain characteristics of the cutter in the general shaping of her underwater body with others of the sloop in her topside, and that is exactly the pith of the problem we are seeking to solve in the various compromises which have lately come into life. In the matter of draft the Mamie is no better off than an ordinary cutter. As to heeling, she will be stiffer at extreme angles, and the easy flare will make a drier, livelier boat, giving also more width across deck. Her rig will be snug; her motion will be measured; she will hold a steady course; display power and be close-winded in a sea; able in a breeze; probably fast, just in accordance as excellence in proportions and shaping are engrafted upon the design of her lines. She will have liberal headroom and length for accommodations, and besides she will be somewhat easier to set up and plank. It is not here proposed to sail off into ecstacy, just because Mamie is something new. Often old ideas are better than innovations. But an analysis of Mamie seems to justify further and fuller trial, for though she may never displace other types, she will be an addition to the circle from which to make choice. She may develop into a very acceptable kind, unless future experiment shows up some drawback not yet appreciated. The proportions of such boats may also admit considerable variation.

Mr. Williams is to lay the keel of another, in which the best method of construction is to be followed, and the advent of this new candidate may supply more accurate comparison.

The chief dimensions of Mamie are: Length over all, 25ft.; on load-line, 21ft. 8in.; beam across deck, 6ft.; at loadline, 5ft. to outside of plank; draft. extreme, 4ft. 8in.; least freeboard, 18in.; displacement, 4.4 short tons approximately.

The Mamie is built with a light, closely-spaced frame. Keel, 10×4in. Stem and post, 3in., sided. Frame sawed, moulded 2in. at heel, 1¾ at head, and sided 1⅜in. Spaced 6in. between centers. Iron floors on every other frame. Plank, ¾in. yellow pine. Clamps, 3×⅞in. Deck beams, 1¾in. moulded and 1¼ sided oak; spaced 8in. Deck, 1¾×1in. thick white pine, laid straight fore and aft. Galvanized iron fastings. Center of mast from fore side of stem, 7ft. 8in. Mast, 19ft. deck to cross trees; 5in. diameter at deck; topmast, 14ft., heel to truck; bowsprit, 10ft. outboard; boom, 22ft; gaff, 14ft. Full cutter rig, with running jib. Sails by McManns & Son, of Boston. Hoist of mainsail, 14ft.; foot of foresail, 7ft.; foot of jib, 10ft. Total ballast, 2¾ tons, 600 pounds of which is outside.

EXPLODING THE FABLES.

THE fond delusions to which the sloop men have clung for so long a time, delusions based partly on a knowledge of the defects of the centerboard sloops, but mostly on a complete ignorance of the cutter, are disappearing rapidly under the light of additional knowledge, and the hard logic of indisputable fact.

Speed has been conceded to the cutters for some time, but to offset this, they have been denounced as mere racing machines, beautiful pictures being drawn of them sailing under water, with only a paid crew on board, usually all lashed fast, while the owner watches the sport from a safe distance, on shore.

When the first rumors arrived here of these vessels sailing across next year, the ultra faithful at once sought comfort in the loud assertion that they would never venture on the Atlantic, and that no contest was possible as the challengers must cross under sail, and that they would not dare to do.

Many who knew better than this, however, were still highly delighted when the report came that Genesta and Galatea would cross under trysails. Knowing what a ship's trysail was and in what weather it was used, these experts at once pictured the huge cutters each under a small triangular rag, and on this assumption at once condemned both boats as unseaworthy and dangerous. It has been a labor of love with us to enlighten the ignorance of these self-appointed experts, and that it has not been altogether "lost" is shown in the fact that they now admit the propriety of the rig for passage, the large racing mainsail being kept for match racing. The last issue of the London *Field* has some remarks on the same subject, in which they corroborate on two very important points the views so long advanced by the FOREST AND STREAM, the seagoing abilities of modern cutters, and their accommodations for living on board. Both of these points we have strenuously insisted on from the first, and both have been denied and ridiculed.

"According to the New York *Herald*, the Genesta and Galatea are going to race across the Atlantic in April under trysails. Some of the New York papers make merry in consequence over the idea of the vaunted British racing cutter going to sea under a trysail, and declare that their owners dare not live on board. If the writers had an opportunity of seeing the owners on board such beautiful vessels, say, as Marjorie and Wendur, and the luxurious comforts they enjoy in the way of cabin accommodation, they would very much modify their opinions as to the British racing machines. It is forgotten that the America crossed the Atlantic in 1851 under a jury rig, and shipped her racing spars at Havre, they having been sent across on a steamer. It is true that the Cambria and Dauntless raced across the ocean with their big spars, and Cambria's boom was 64ft., mainmast deck to hounds 62ft., and bowsprit 41ft. outside. The Fleetwing, Henrietta and Vesta came across before the westerly gales in the winter of 1861 under big spars, and no doubt the British racing cutters could do the same, although they might often have to stow their booms, and would probably require a new sail to race with on arrival. Among other notions derogatory to the British cutters is one that their lead keels will drop off, and that if they get hit by a big sea they will crumble up like match wood. Of course a lead keel may drop, although, so far as our knowledge goes, it has only happened yet when fastened with iron bolts; and a yacht may be 'crumpled up' just as ships are; but let us hope that these anticipations are founded

rather on a lack of knowledge of what the British cutter is like than an intimate acquaintance with her."

The imagined contingency of a cutter dropping her keel has afforded much amusement to a certain clique, a mythical yarn concerning the Crusader being advanced in support of its likelihood; but as yet nothing of the kind has happened in practice except one or two unimportant cases like Crusader's, where a small weight patched on with iron bolts has been dropped by their corrosion. The securing of a lead keel of 60 to 70 tons is an engineering problem of no small magnitude, and should be done only by experienced men, but properly constructed there is no reason to anticipate any failure.

The discussion over the proposed races, even if they should not take place, is adding still more to the popular knowledge of our rival craft, and to it it is due that the quietus has been given to another long-cherished libel on the cutter. We quoted, two weeks since, an editorial from the *Herald* of a totally different tenor from all its previous utterances, and this week we note more to the same effect, as follows:

"Two challenges for the America's Cup were sent on Dec. 6 to the New York Yacht Club—the first on behalf of the yacht Genesta and the second on behalf of the new yacht building for Lieut. W. Henn, Royal Navy, which he has named the Galatea, after the well-known frigate in which he served for several years on the coast of Canada, etc. These two yachts propose starting for America about the 24th of May, and intend to compete in all races open to them in America. Sir Richard Sutton, Bart., and a few friends will go out in the Genesta, while Mrs. Henn will, as usual, accompany her husband on board their new craft, and will be the first lady to cross the Atlantic in a racing yacht. After the racing is over in America the Galatea will most probably cruise to the West Indies, Mediterranean, etc. The Cythera is expected in New York about the 1st of July. Thus there will be three English yachts in America this year."

Not to go back to Julanar, of six beams, built expressly for Mediterranean cruising, and get a wonderfully fast boat, we can mention that Galatea, as we learn from private correspondence, while building expressly for the purpose of racing for the America Cup, "has been designed with a view to her being converted into a comfortable cruiser when her racing days are over, by the reduction of sticks and ballast." Lieut. Henn's former yacht, the yawl Gertrude, was similar in design and proportion to the Bedouin, and her reputation as a fast boat is undisputed, but in her Lieut. Henn and his wife have cruised nearly 50,000 miles, including a number of trips through the Bay of Biscay and cruises in the Mediterranean. Further, Lieut. Henn sails and navigates his boat himself, trusting to no sailing-master. Galatea, now building, will be of steel, and over 80ft. waterline, and will be launched in April, visiting us in June, as she will not race in England before coming here, and besides her we shall have another "fast cruiser," Cythera, now cruising in the Mediterranean, whence she will visit the St. Lawrence River, and, later, New York. These two, with Genesta, will give ocular demonstration of the seagoing abilities, cruising accommodations, and, we trust, speed as well, that will convince the most skeptical.

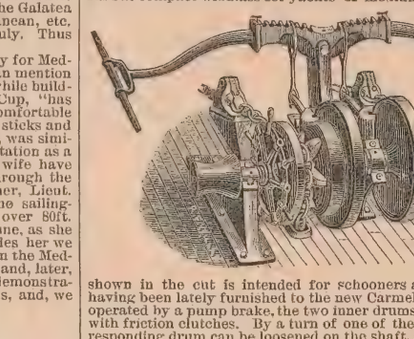
SOLID ON CUTTERS.

A RECENT editorial in the *Herald*, as well as some items in its personal columns, fell like bombshells in the camp of the ancients who still harp on racing cutters as unfit for cruising, and imagine narrow beam a piece of fanaticism on the part of the English. The editorial in question exhibited such an excellent understanding of the real merits of cutters and was so free from national prejudice that, as might have been expected, its origin was to be traced to one practically familiar with yachting abroad. The article was inspired by none other than Mr. J. G. Bennett himself who, to set his own journal straight in its record, cabled from England the essence of what appeared in the *Herald* next day. It is very agreeable to know that at this critical juncture there hovers over the columns of the *Herald* a directing hand, which really is equal to the business. At last it seems as though one of the New York dailies, at least, proposes to call a halt to rubbish of ignorant home manufacture, and give to us in America one daily of whose criticisms on yachting one need not be ashamed. So far from being "mere racing machines," both Genesta and Galatea are looked upon and treated as cruisers by their owners. They propose to cross over in their vessels with their families on board, and after racing in these waters, cruise for the West Indies and foreign ports in general. And upon this they look as a matter of course, a venture involving nothing out of the common to them, for it will not be the first time their vessels have been headed for the sea. We are also to have Cythera make her number with us this season. That adds still another of the same breed, and depend upon it, by the time they have taken their departure, the silly nonsense talked and written against such splendid cruising vessels will have dissolved into ether in face of bottom facts and the truth, of which these visiting yachts are evidence in the flesh. Properly enough, and quite to my liking, the *Herald* makes no bones in designating the stuff put forward against such cutters as "twaddle." Galatea will be much like the well tried Wendur, and a finer boat than the Scotch yawl Wendur would be hard to find. Her performance is on record in the English prints, and what she can do in a blow and sea the rest of the class can do just as well. The whole crusade against narrow boats proceeds from men who have never seen one or sailed in one, and talk blindly from their wild imagination. Hence my congratulations that the *Herald* is to have sense at its wheel, and that the New York Y. C. rejoices in a commodore who can counteract the drivel passed round among the landsmen who accomplish all manner of wonders in skimming dishes up in Madison Avenue but nowhere else.

Irreverently stated, "Jim" is solid on cutters. C. P. K.

A VERY IMPORTANT MATTER.

YOUR editorial last week brings up a question which deserves the immediate attention of the New York Y. C. in some form or other. From private correspondence direct from headquarters, it appears that our English friends are under the impression that the form of a challenge for the America Cup has been sufficiently complied with and that the six months period will count from the date of Mr. Beavor Webb's letter, addressed to the club. At least this is the only interpretation which I can put upon the wording of the correspondence referred to. Now, if the conditions of the deed of gift were so clear and explicit as to admit of no doubts or questions upon the formalities to be gone through, the New York Y. C. might *legally* decline to interest itself at all in the matter, allowing the English to take the consequences of their own oversights or mistakes. But *morally*, even then, the club would hardly desire to spring any technicality upon the challenging parties, allowing them to come over under the mistaken idea that they are entitled to a race at a certain date, and then suddenly to inform them that owing to some technical irregularity in the outward form of their first notice of a challenge, the club must insist upon an additional postponement. Yet this is precisely the position of affairs at this moment, if I can judge from the private correspondence received. That is to say, while the English yacht owners appear to think that the official date of the challenge is already fully settled by Mr. Beavor Webb's letter and that any further documents in amplification can be forwarded at leisure and have no influence upon setting back the date, we, here in America, are laboring under a contrary notion, that the said letter from Mr. Webb is only in the nature of a "preliminary notice," and not at all intended as the document from which the six months' time is to be counted. This is a serious divergence of views which, in credit to itself and the spirit of the whole business, the New York Y. C. should take up without a moment's delay. Stated curtly, an understanding should be arrived at as to the present status of affairs. Either the N. Y. Y. C. does not propose to accept Mr. Webb's letter in the light Englishmen regard it, or else it will count the letter as definite in its proposition. If the former, then as a matter of good sporting spirit and common courtesy to gentlemen proposing to come three thousand miles in their yachts, the club should notify them at once that in its opinion no regular challenge has yet been received, and that the six months' interval can only be reckoned from the receipt of certain other documents stipulated for in the deed of gift according to the translation of its meaning by the N. Y. Y. C. Or, on the other hand, if Mr. Webb's letter be considered definite enough, as it certainly is in its spirit, then an authorized answer to the owners of Genesta and Galatea is due, to put the whole matter at rest. As the club has taken no official action, and has positively given out that it is still awaiting what it conceives to be the "regular challenge," we, on this side of the Atlantic, know exactly how the club stands on the question. It does not propose to view Mr. Webb's letter in any other light than a private note having no effective import.



No one can say the club is not legally justified in refusing official action upon Mr. Webb's note, inasmuch as that note altogether fails to comply with the letter of the rules governing a challenge. But, I believe, the New York Y. C., in common with the American public, is much less concerned about the mere letter and more about the spirit animating both sides. Nothing could be further from the intentions of the club than to allow the English to go on with their preparations and delay further documents under a misconception luring them on into a sort of trap of technicalities which the English really have set themselves in not solving with sufficient good luck the muddle of words composing the conditions of the challenge. Consequently a few lines in explanation, requesting the challenge to be put in a shape corresponding to the conditions and announcing the impossibility of action before the receipt of such fresh and revised notification, would be an act of sporting equity and courtesy which I hope will be at once attended to either by the club or else by its secretary. In the event of the club declining to set the English yachtsmen right, this letter in your columns will serve to put them on their guard and hasten a full compliance with the most minute particulars of the conditions, so that the date of the races may not be put off, contrary to the intention with which Mr. Webb's original notice was sent.

In conclusion, it is to be greatly regretted that the "deed of gift" and its conditions were not properly "edited" by some capable person before being sent broadcast over the world a jumble of dubious English, permitting all sorts of speculation as to its real intent and inviting just such misapprehension as I have dealt with above.

C. P. Kunhardt.

THAYER'S YACHT WINDLASSES.

THE windlass illustrated below is one of several styles manufactured by Mr. B. F. Thayer, No. 155 South street, New York, and furnished by him to many large and small yachts. In all these windlasses the disagreeable clanking of the pawls is entirely done away with, their operation being noiseless, while the drums in the larger sizes are locked in any position. The smallest size, fitted for yachts of 30ft. or under, is very light and compact, setting down close to the deck. It can be made to fit any size bitts or sampson post from 5×3in. upward, and is operated by two handspikes in the ordinary manner. A larger size is operated by a double pump brake, carried on an iron bracket arm screwed to the bitts, and makes a very powerful but compact windlass for yachts of medium size. The windlass

shown in the cut is intended for schooners and steam yachts, one having been lately furnished to the new Carmelita. It is, as shown, operated by a pump brake, the two inner drums for chain being fitted with friction clutches. By a turn of one of the hand wheels the corresponding drum can be loosened on the shaft, allowing the cable to run out, and it may be checked by a turn in the opposite direction. By the same wheels the chain drums may both be entirely disconnected, turning freely on the shaft, so that the gipsy heads may be used for warping, hoisting sails, etc. Extra stoppers for the chains are also provided on deck. Mr. Thayer also manufacturess a neat and simple cathead stopper, to be screwed to the rail, the anchor being released by turning a small hand wheel.

YACHT BUILDING ABROAD.

THE variations in yacht building from year to year are well shown in the following table taken from the London *Field*. The conclusions to be drawn from it as to the present and future conditions of yacht racing are not particularly encouraging, but such periods of depression as the present are always followed by seasons of renewed activity. The increase in the number of yachts built each year that is so marked from 1871 to 1876 has fallen off during the last two seasons, and the tonnage, which reached its highest point in 1877, has declined still more, last season being far below the average. It is probably owing to the decadence of schooner racing that the average tonnage for the last half of the period is much less than for the first half. How much of the falling off is due to business depression is impossible to state, but in spite of the unsatisfactory figures for last year, there is no cause for alarm over any general decline in yachting. The *Field* says:

From an examination of Lloyd's Yacht Register, it would appear that there have been 1476 yachts built during the last fourteen years, of and above 5 tons, with an aggregate tonnage of 77,534 tons. Putting the cost per ton at £40, the cost would have been £3,101,300. No doubt many of the yachts built about the year 1871 have disappeared from the Register; on the other hand, no doubt, several small yachts built during 1884 have not been included. We have tabulated the yearly output of yachts since 1871, and it is satisfactory to note that the falling off in the gross yearly tonnage since 1880 is no worse than it was in 1878, the year which marks the break down of schooner racing. It is true that, at present, there is little to be satisfied with in the building or racing prospects for 1885, and we must wait for the turn of the tide, which will be sure to come, just as it did in 1880.

	1871	1872	1873	1874	1875	1876	1877	1878	1879	1880	1881	1882	1883	1884

Ave'ge ton'ge.	62	48	52	66	50	53	67	40	40	64	47	51	50	48

SPARS OF CLASS RACERS.

FOLLOWING are given the proportions of the spars of 5, 10, 20 and 40-ton racing cutters, which have been compiled from the dimensions of spars which have from time to time been published.

It will be seen that there is a great similarity between the spars of the various classes; slight differences, however, occur in yachts hailing from different designs and builders. Generally the proportions of the spars decrease as the tonnage increases, owing to the larger yachts not having as much depth and displacement in proportion to the smaller ones, consequently they are not able to carry such large sail spreads. Usually a cutter's mast is stepped 4 of the length of the counter, abaft the foreside of the stem, and the length of the main boom is thereby determined in conjunction with its projection beyond the taffrail. In the smaller classes it will be seen that the proportion for the length of the main boom is greater than in the larger classes, owing to larger yachts not having proportionately as long counters, nor as great a proportionate length of boom beyond the taffrail as smaller yacht. As a general rule, the counter of a racing cutter is equal to about .18 of the length on W. L., while the length of main boom beyond the taffrail is about .15 of the length on W. L. in 5-tonners, decreasing in proportion as the tonnage increases.

Generally the head of a cutter's mainsail makes an angle of 50° to 54° with the waterline, and the gafftopsail 70° to 76°. A working gafftopsail yard is generally slung with .64 of its total length on the aft side of the topmast. Spinnaker booms in cutters vary in length from .98 to 1.44 of the length of mainmast (deck to masthead cap), 1.22 being the mean. In the 40-ton class, the proportion for the length of topmast is not given, but is much the same as in the other classes.

Mastheads vary somewhat in length, the proportion being rather greater than it was a few years back, or about .22 of the length, deck to hounds. A cutter's working gafftopsail yard is equal to .95 of the whole length of gaff, while the balloon gafftopsail yard is equal to .95 of the length of main boom.

In calculating cruising spars for cutters from any of the proportions given, a deduction of .08 would be made from the length of every spar; that is, the length of every spar would be multipled by .08 and the product deducted from the length of the spar which was multiplied.

SPARS OF RACING 40-TON CUTTERS.

Mean length of mainmast (deck to hounds) is equal to beam multiplied by 3.52; mean length of bowsprit outboard is equal to length on waterline, multiplied by .448; mean length of main boom is equal to length on waterline, multiplied by .866; mean length of main gaff is equal to length of main boom, multiplied by .67.

SPARS OF RACING 20-TON CUTTERS.

Mean length of mainmast (deck to hounds) is equal to beam multiplied by 3.55; mean length of topmast (fid to sheave of topsail halliards) is equal to length of mainmast (deck to hounds), multiplied by .87; mean length of bowsprit outboard is equal to length on waterline multiplied by .48; mean length of main boom is equal to length on waterline multiplied by .872; mean length of main gaff is equal to length of main boom multiplied by .67.

SPARS OF RACING 10-TON CUTTERS.

Mean length of mainmast (deck to hounds) is equal to beam multiplied by 3.64; mean length of topmast (fid to hounds) is equal to length of mainmast (deck to hounds) multiplied by .898; mean length of bowsprit outboard is equal to length on waterline multiplied by .506; length of main boom is equal to length on waterline multiplied by .88 to .9; mean length of main gaff is equal to length of main boom multiplied by .72.

SPARS OF RACING 5-TON CUTTERS.

Mean length of mainmast (deck to hounds) is equal to beam multiplied by 3.58; mean length of topmast (fid to hounds) is equal to length of mainmast (deck to hounds) multiplied by .9; mean length of bowsprit outboard is equal to length on waterline multiplied by .502; mean length of main boom is equal to length on waterline multiplied by .892; mean length of main gaff is equal to length of main boom multiplied by .695.

It must be understood that the proportions of the spars given are of cutters having a length on W. L. equal to from 5 to 5.8 times the greatest beam. For cutters that have a length on W. L. less than 5 times the greatest beam, the proportion given for the length of mainmast (deck to hounds) in the various classes is too great.

Usually the length of mainmast (deck to hounds) in cutters having a length on W. L. less than 5 times the greatest beam, varies from 3 to 3.25 times the beam. In some cutters, in the classes of 10 tons and under, the length of mainmast (deck to hounds) is as much as 3.8 times the beam, but such a high ratio is uncommon, except in yachts having a length on waterline of 5.9 times the beam.

Mr. Hewett's famous 10-ton cutter Buttercup has a length of mainmast (deck to hounds) slightly over four times her greatest beam.—*Hunt's Yachting Magazine.*

YACHT PHOTOS.

THE great improvement in photography in the last few years has made it possible to obtain such pictures of yachts under sail as can be made in no other manner, as no handiwork, however skillful or artistic, can give the faithful reproduction of every fold and wrinkle of the canvas, and the exact form of every wave, that is found in a photograph. The best specimens of yacht photos we have yet seen, are those taken by Messrs. West & Son, of Gosport, England, who make a specialty of this class of work, Following the races in their own boat with the best of apparatus, they are enabled to catch instantly all the noticeable portions of a race, and to photograph the yachts when under full headway. Apart from their value as works of art or souvenirs, these photos are of value to the yachtsman, as by their aid he can study at leisure many important details, the set of sails and form of waves, that cannot be observed in the hurry of a race or at a distance.

One of the finest of Messrs. Wests' pictures is a broadside view of the schooner Miranda on the wind with topsails set. Every detail of the grand vessel is shown with the greatest minuteness.

A second view of Miranda shows her starboard side, with spinnaker set and crew standing on deck.

A view of Tara, the counterpart of Ileen, taken from a point on the starboard bow, shows her with scuppers awash closehauled under big topsail, but a look at a number of pictures of racers on the wind shows them at a much smaller angle of heel than they are commonly supposed by our yachtsmen to sail at.

An excellent view of Marguerite shows her head on, under spinnaker and jackyard topsail, while a second view shows her with boom flat in and big topsail still set, her crew seated comfortably on deck, without that frantic effort to hang on or life lines to lash themselves fast, that are supposed by many to be indispensable in cutters. The big topsail and loose-footed mainsail sit to perfection, and on their white surface are thrown the shadows of halliards, shrouds and even ratlines, outlined with perfect distinctness.

A view of the leeward sides of Buttercup and Ulidia, both tens, with jibtopsails set, shows the famous "clipper bow" of the former. The crew are seated on deck, spinnaker booms are dropped to starboard, and Buttercup, the leader, has her spinnaker ready forward to run up.

By far the finest photo we have yet seen of a yacht is that of the little three, Chittywee. She appears with boom almost amidships. Her helmsman is seated on deck, one hand on tiller, while a man lies forward on the weather side. A working topsail is set over a single reefed mainsail, and although a good breeze is evidently blowing, judging by the neighboring boats, she shows a high side above water. Astern the foam and crests of the waves are seen, giving life and activity to the entire scene.

The list of photos includes several hundred yachts and war vessels, the former including all the racing fleet.

THE KUNSTADTER STEERING PROPELLER.

THE despatch boat Nina has been lately fitted with the Kunstadter patent screw propelling and steering apparatus, and during the past two months a series of careful trials have been made by a special board composed of Com. Isherwood, Chief Engineer U. S. N.; Capt. Theodore Zeller, U. S. N.; Chief Engineers George W. Magee, George P. Hunt and three passed assistant engineers. Since Dec. 1 nearly 450 turns have been made on the Hudson River and New York Bay, many in rough weather and a heavy sea, in order to test the speed both ahead and astern, and the turning power. The boat was turned to port and starboard from seven to ten times each with the rudder at an angle of 10 degrees, similar tests being made for 15 degrees, 20 and other variations up to 45 degrees. All of these tests were made both ahead and astern. At an angle of 45 degrees the boat turned in a circle of 200ft. diameter, and at 10 degrees the greatest diameter of circle was between 900 and 1,000ft. During these tests the engine made from 20 to 75 revolutions. With the rudder at 45 degrees a full circle was described in less than three minutes, at a speed of 11½ knots. The Nina steered astern as easily as ahead, and on one occasion made 5 knots astern in a straight line. The dimensions of the Nina and the screws are as follows:

Length between perpendiculars	137ft.
Length over all	154ft.
Beam, moulded	26ft.
Depth, moulded	12ft. 6in.
Rudder surface, original	53¾sq. ft.
Rudder surface, with screw	30⅜sq. ft.
Indicated horse power	450
Diameter of large screw	10ft.
Diameter of small screw	6ft. 8in.

The vessel is fitted with a screw and shaft of the usual form. The rudder in the line of the shaft is enlarged in the form of a casing carrying a section of shaft, on which is hung a second and smaller screw directly astern of the rudder. The after shaft is connected with the main shaft by a universal joint, in such a manner that it turns freely at any angle at which rudder is placed.

This after screw not only increases the speed, but exerts a positive side pressure on the stern, in conjunction with the rudder. Last week the Nina was placed on the screw dock at New York and the after screw removed. The area of the rudder was also increased considerably, and she will now be tested in a similar manner to determine her powers with a larger rudder and only the ordinary screw, the result of which experiment we will give when completed. She has also been fitted with a new device of Com. Isherwood's, a wheel affixed to her side which registers her speed through the water.

NEW YORK Y. C.

ON Thursday last the New York Y. C. held their first general meeting of 1885, at the club house, the attendance being larger than usual. The officers elected were: Commodore, James Gordon Bennett; Vice Commodore, William P. Douglass; Rear Commodore, Francis C. Lawrence, Jr.; Secretary, Charles A. Minton; Treasurer, James O. Proudfit; Measurer, John M. Wilson; Fleet Surgeon, Morris J. Asch. Regatta Committee—J. Frederic Tams, Charles H. Stebbins and Jules A. Montant. House Committee—T. B. Asten, Elijah A. Houghton, B. C. Oleeman and Frank T. Robinson. Committee on Admissions—James D. Smith, John S. Dickerson, F. W. J. Hurst, William E. Iselin and Ogden Goelet.

Thirteen new members were also elected. A crayon portrait of the late Rear Commodore, Samuel R. Platt, and an engraved copy of the resolutions passed by the club on his death were presented to the club. Mr. Ogden Goelet offers again cups for schooners, cutters and sloops, in the following letter:

NEW YORK, Feb. 5, 1885.

DEAR SIR—Please express to the club my intention of presenting a one thousand dollar cup to be sailed for by schooners, and a five hundred dollar cup to be sailed for by sloops and cutters, the race to take place at Newport during the cruise of 1885, over the same triangular course as last year, both races to be sailed on the same day.

While the conditions under which said races are to be sailed will remain practically the same as last year, I desire to reserve the right of modifying the same if it should seem desirable for me to do so prior to the date of the cruise. Yours, etc., OGDEN GOELET.

No action was taken in regard to the Cup contest, as the club is still waiting for further communications from abroad.

ELECTIONS OF OFFICERS.

Michigan Y. C.—Commodore, H. C. Hart; Vice-Commodore, O. W. Baker; Rear Commodore, Arthur J. Phelps; Secretary, Alexander I. McLeod; Treasurer, J. B. Badby; Measurer, E. S. Wendell,

BUFFALO Y. C.—*Editor Forest and Stream:* It is with pleasure that I note the active preparations now being made here in Buffalo to make our next yachting season a lively one, and the increased appreciation which our yachtsmen seem to have of the sound principles advocated by the FOREST AND STREAM in regard to rig, model, etc., and its ideas of what a safe and comfortable seagoing boat should be. The schooner Mermaid has been changed from a light-draft centerboard to a deep keel, which will give over 6ft. head room in the cabin and increase her draft to 5ft. The sloop Ripple, recently from New York, has been undergoing extensive repairs. Sloop Turk is having a fantail put on her stern, and the owners are to try her as a cutter, with the exception of housing topmast and bowsprit. The old B. Y. C. now has a rival yacht club, which was organized last fall under the name of the Buffalo City Y. C., and although some effort has been made to consolidate the two clubs, it is generally understood they will remain separate. Perhaps the friendly rivalry may be the means of increasing our at present rather small fleet. Hope to give you particulars of some of our regattas this coming season.—CRESCENT.

NEWARK Y. C.—The first annual banquet of the Newark Y. C. was held on Wednesday evening, Jan. 28. About 125 members and guests sat down to the dinner. Among the guests from out-of-town clubs were Commodores Graff and Thorpe, of the Harlem; Prime, of the Yonkers, and Pullman, of the Pavonia. Letters of regret were read from the commodores of the New Haven, New Jersey, Knickerbocker and East River clubs. The event, like all the past efforts of the club, was a decided success, the recurrence of which will be looked forward to with pleasure by all who participated. Among the things talked of during the flow of song and story was a series of open matches for boats under 35ft., under the auspices of the various clubs about New York, acting as a whole through a committee.

A NEW CRUISING SCHOONER.—Mr. C. H. Bliven is now building from his own designs a schooner yacht for Mr. J. J. Phelps, who proposes to make a cruise around the world in her, starting this spring. Her dimensions are: Length over all, 112ft.; on waterline, 102ft.; beam, 25ft.; depth of hold, 11ft. 3in.; draft, 11ft. Displacement, 265 tons. The yacht will have a flush deck and inside ballast of iron, and will be very strongly built. She is now in frame at Nyack, on the Hudson River.

TRIAL TRIP OF THE CARMELITA.—The Carmelita left Greenpoint on Friday last for a trial trip, but, owing to heavy ice, did not go out of the East River. She started off with two-reefed mainsail and single reef in foresail, a high wind blowing from the north and weather very cold. The reefs were soon shaken out, when she carried full sail through the heavy puffs in a way that fully proved her stiffness. She is now in excellent trim and all gear is working rightly, so that after a scrub on the screw dock he will start for San Francisco.

YONKERS Y. C.—This club will soon combine with the Vesper Y. A., of Yonkers. The house of the latter club has been badly damaged by the ice.

Canoeing.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

FIXTURES.

March 3—K. C. C. Camp-fire, 106 West Forty-second street, 8 P. M.
March 17—K. C. C. Camp-fire, 106 West Forty-second street, 8 P. M.
March 31—K. C. C. Camp-fire, 106 West Forty-second street, 8 P. M.
May 30, 31—Hudson River Meet.
July ——Western Meet, Ballast Island, Lake Erie.
July 24 to Aug. 8—A. C. A. Meet, Grindstone Island.

LAKE ERIE MEET.

COMMODORE GARDNER deserves a vote of thanks from the A. C. A. for the vigorous and enthusiastic way in which he has worked to make the the proposed canoe meet at "Ballast Island" a certainty. There are about forty names of Western canoeists on the A. C. A. rolls, and yet but few have ever been able to be present at the annual meets since the days of the Cincinnati Club at Lake George.

It has been for several years a question of great interest and moment to many of the older A. C. A. members, as to what course to pursue to spread the Association westward, and to revive the interest therein in portions of the country far distant from the locality of the annual meet. The local meet idea has solved the question, and made possible the extension to all canoeists of the undoubted benefits gained through A. C. A. meets and membership. While it will be impossible for me to be at Ballast Island myself, as my summer vacation is absolutely limited to the two weeks of the Grindstone meet, I hope that some of the officers may be able to be present, and be of some service. If there is any way in which I can further the success of the meet officially or otherwise, I hope and trust that Commodore Gardner will not fail to command my services.

I would commend to him and his committee the A. C. A. programme of races for this year, or at least such portions of it as are best adapted to the canoes likely to be present and compete, and I feel certain that Captain Gibson, Chairman of the A. C. A. Regatta Committee, will be glad to do what he can to assist as to organization in camp. We found at our local meet last year that the selection of a camp commander by the canoeists present found much favor and worked well. This commander appointed the Regatta and other committees, the local canoe club making the necessary previous arrangements, and the various clubs participating furnishing the necessary prize flags, etc. The whole arrangement worked harmoniously and well. I hope that there may be a large number of A. C. A. men present at Lake Erie, and that a large delegation will be sent to Grindstone prepared to propose the name of the officer to be chosen from the Western section for the next year. Personally, I do not think that there should be any such distinctions as Eastern or Western. We are all American canoeists. Let us stick to that; but let the vice-commodores (three, as suggested in my last letter) be chosen from North, East and West, and let them specially look to the interests of the section of the country from which they come, and preside at the local meets, etc. I am for the American Canoe Association—one and undivided, all the time. ROBERT SHAW OLIVER.

ALBANY, N. Y., Feb. 6. Com. A. C. A.

A CANOE CRUISE THROUGH LONG ISLAND SOUND.

IN the summer of 1882, I made my first canoe cruise in Long Island Sound. Equipped with an Everson shadow canoe, rigged with two lateen sails, and well supplied with necessary "shipstores," I left the little village of Eastchester at daybreak on June 10. Launching my small craft into the narrow creek I propelled quietly along between banks of high rushes and salt grass. Over the meadow hung a thin gray film of mist not thick enough to hide, but only to render things mysterious. The sleepy town of Eastchester with its picturesque church seemed to be floating on this sea of vapor.

After a paddle of three miles I passed under Pelham bridge and out into Pelham Bay. A gentle breeze from the southwest made the water gleam and sparkle in the morning sun. Here setting my sails, I soon reached City Island and found myself in Long Island Sound. The light mist through which I had been sailing had thickened into a regular fog bank, but as I had charts and compass aboard I got my course and entered it boldly, taking the regular ship course.

Sailing in a thick fog is an experience well worth trying; it is a curious sensation as if one were blindfolded, surrounded by a milky gray film which renders sight useless. In this way I sailed for an hour, running free at a rate of 3½ miles an hour. Suddenly a dark form loomed up, which resolved itself into a schooner; a specimen "down Easter" had the wheel, and as he spied my small craft he saluted me with, "Gosh! what do you call that craft?"

"The Alice," I replied.

"Got lost, haint yer?"

"No, I have a compass."

"Whar yer bound?"

"Connecticut River."

"Thunder! glad 'taint me."

By this time the schooner had vanished, and soon after I heard the order of "draw 'way" as she came about. The fog gradually lifted and at 10 o'clock I was off Captain's Island, with a spanking breeze and making at least six miles an hour. The water had changed from gray to a deep blue with here and there a white cap. Until now I had been running with the tide, but as it changed I made for the shore to take advantage of the "slack."

At noon I passed Stamford and Darien and soon reached the mouth of the Norwalk River. Here among the cluster of islands which form a natural harbor I took my first meal afloat. Canned goods eaten off wooden plates are certainly not all an epicure could desire, but when seasoned with a good appetite and such surroundings I found it fit for a king. Then I had the assurance that after dinner there would be no dishes to wash—only a wooden plate or two to throw away. As all one's lazy propensities crop out while canoeing, so I heartily recommend cruising canoeists to supply themselves with a dozen or two wooden plates, and thus save much unnecessary trouble. Dinner disposed of, I again got under way and sailed through the several miles of sheltered water inside Norwalk islands and out again into the open Sound. By this time the wind had raised quite a sea, and I found it quite exciting work, at times poised on the crest of a wave, and then sliding down into an abyss with much the same sensations one has, sliding down a steep hill.

Westport, Southport and Black Rock are passed in succession, and just as the sun is setting I find myself off Bridgeport. The western sky is a blaze of gold, scarlet and purple, while the sea beneath is of an intense blue gray. As the wind holds strong I decide to risk getting shelter further on and head directly for Stratford Point Light, which glows with a pale rose color in the east. By the time I reach the point it is nearly dark. The keeper of the light is within hail, and to my request for a night's lodging replies that he is not allowed to take any one, but directs me up the Housatonic River, which here empties into the Sound. Much against my will I head for the river, but as I know nothing of the water, and it is now too dark to see anything but the glow of the western sky, I soon find myself aground among tall reeds and salt grass. The mosquitoes, which here attain a size which it would be dangerous for my reputation to try to describe, attacked me in force, and it assumed the proportions of a struggle for life. By dint of pushing with the paddle I forced my way over the shoals, and at last spied a light in the distance. Keeping this in view, and not knowing what I might run into, I finally found myself ashore on tolerably firm ground. Hauling my craft up, I made for the house through tall grass and pools of water. I found a young man and his mother, both of whom looked very much alarmed when I asked if they could lodge me, and said across the river I would find a good hotel. Alas! is there no rest for the weary?

The young man went with me to the shore and pointed out a light which I steered for blindly, and at last found myself ashore with the cheerful light of a hotel blazing in front of me. With the help of several people who appeared, I lodged my craft for the night high and dry on the beach, and was soon doing justice to a good supper.

The next morning was fair and warm. Long Island Sound lay like a mirror under a pale blue sky. To the southward, Long Island lay, a faint line of purple, scarcely discernible from the sea and sky. Numerous craft drifted quietly along, their sails hanging idly from the masts. As the tide was against me, I decided to wait for high water slack. At 9 o'clock I launched again, and as there was not a breath of wind, I took the paddle and settled into the regular swing which one learns to take when there is a prospect of a long pull ahead.

As I had six hours of favorable tide before me, I made at once out into the Sound to take advantage of the full strength of it. The tide runs faster and longer off shore, and I found it as near as I could calculate to be running at least three miles an hour during its strength. After two or three miles of paddling and when well off shore, I saw along the eastern horizon a faint blue line which indicated a breeze. Yes, the craft off Long Island shore have it and are bowling along at a merry pace. As it reaches me I see it is from the S. E., a head wind; but as the Alice is particularly smart on the wind, I do not mind. After taking one tack to the south, I then am able to lay my course down Sound. The breeze holds well until I am off New Haven harbor, when it suddenly dies out. I take advantage of the quiet and lunch. (Canned goods and wooden plates again.) Before the lunch is fairly disposed of a gentle breeze spring up from the S. W., which gradually settles into a steady wind. The water deepens into the familiar greenish-blue, and wing and wing I go rapidly on my way. New Haven lights are passed, and then Branford. At 2:30 I pass Pine Orchard and find myself among the Thimble Islands.

These islands, some thirty in number, are clustered within the radius of a mile, they vary in size from an acre to small rocks scarcely awash at high tide. On most of the larger ones summer cottages have been built, and as the fishing and sailing is unsurpassed in that vicinity, it is no wonder that they have long been a favorite resort for people who like a quiet place.

Out into open water again, Sachem's Head looms up in the east, and is soon passed; off shore Faulkner's Island rises dim and gray in the distance.

After passing Guilford Harbor the shore is low and sandy for many miles, terminating in Hammonasset Point. This is passed and also the quiet town of Clinton. A few miles further on several islands are passed, and just as the sun is setting Cornfield Point is reached. From here Saybrook light is plainly seen, and before the daylight has faded I pass over the bar and into the Connecticut River. What a contrast! As I pass the breakwater the rush and tumble of the Sound gives place to the quiet of a river. I head directly for the Pease House, where boatmen are always sure of a welcome.

I lay up my craft for the night, and as I look out on the waters of the Sound, now dark and gray under the evening sky, I feel mingled pleasure and regret that my first sea cruise in a canoe is over.

D. W. TRYON.

THE FLAGSHIP.

THE Marion B. has arrived, and the crew being jubilant is impelled to write and describe her for the benefit of the brethren and for his own personal gratification. It seems to be the fashion, and the "commodore" hates to "get left." Seriously, it is the finest piece of work that I have ever seen turned out by Rushton, and that is saying much. The model is to be known as Mohican No. 2. Dimensions: 15ft., 31in. beam, 11in. amidships, 19in. bow, 17½in. at stern, with deckrise of about 2in. Cockpit is 6ft. long by 17in. wide, pointed forward, and the coamings parallel. Mainmast tube 15in. from bow, dandy tube 86in. from stern. Cockpit is placed very far aft, giving a great spread of clear flush deck forward. There are light brass airtights forward and aft, and a large brass tank with airtight lid for day stowage forward of cockpit and under the flush deck. The brass work, tank, lid and all, weighs less than 13 pounds, and absolutely solves the question of dry bedding and clothing at all times. The deck tiller and foot stearing gear are the same as generally used by the club last season. The Stoddard drop rudder modified somewhat is also used. A broad Mohican deck seat is arranged so as to slide forward or aft on the coaming 12in, or more to enable the crew to change the balance of the canoe according to the wind. Lastly, a Child's centerboard is attached, the trunk exactly flush with the floor. Of this board, however, I have as yet had no personal experience; but have great faith. Whether the Marion B. will be fast or not remains to be seen; but that she is a most perfect piece of work, and most perfectly arranged to suit the exact wants as to comfort and convenience of her rather exacting crew, there can be no doubt. I have a large Mohican sail for her with all the usual trimmings; main 70, dandy 25, and am now engaged in rigging up the same in a high room to my own satisfaction, and the general edification of the Turtles. As compared with the Sunbeam model, the Marion B. is not so fine forward, has a much flatter floor, amidships especially, and is undoubtedly a much stiffer boat. I am afraid the Sunbeam will get away with her in a light breeze; but give her plenty of wind, and I believe she will do handsomely long after the Sunbeam has been obliged to take in every rag. We'll see. COMMODORE.

SINGLE AND DOUBLE PADDLES.

ABOUT a year ago I succeeded in bracing up "Nessmuk's" belief in the double paddle for speed. At the same time I mentioned that the then approaching meet would, to a certain extent, settle the question. I do not think, however, that any one was prepared to see such a sweeping victory for the double. It may of course be said that Weller can be beaten by other men using the single. That may be quite true, but it will also apply to Johnson. If Dr. Heighway turns up this year, it is quite possible that Johnson may more than find his equal.

I think all canoeists who have looked into this question closely, must admit that, everything else being equal, the double must win. Given equal canoes and equal men, the greatest speed will be attained by the man using the double.

When the double paddle first came into competition with the single it was quite natural for the users of the latter to consider it the best. The double paddle men sat too low, and used blades not adapted for speed. Their canoes were shorter, broader and heavier, and in every way not fit to compete with the craft paddled by the single men. This has all been changed and the natural result follows.

The single paddle has many advantages. It is cheaper, lighter and shorter. There is no drip from it, and for hunting purposes there can be no question to its superiority. The double is superior for speed, and is better for decked canoes.

Johnson says that he was not pushed in his races at the '84 meet, except when Weller used the double. I see that Weller admits that after several trials he considers the double the speediest, and there was a race at Peterboro last fall, in which both men used the double.

BOREAS.

"CANOE BUILDING FOR AMATEURS" *is now ready, and can be had at the office of the Forest and Stream, or will be sent by mail on receipt of* $1.50.

SEND ON THE CRUISES.

Editor Forest and Stream:

The following remark was made to me a short time since, "The paddle appears to be gaining universal popularity."

My canoe experience is two years old, during which time I have seen but four canoes afloat. The first one was sufficient to convince me that I had found "a long felt want" for pleasure and recreation. Field sport is getting to be all hunt and no shoot; angling, all water and no fish. Something must take their place, and nothing can so well do it as the canoe. Of course I take the greatest pleasure in keeping my shooting and fishing tackle in good shape, as I might move West some day, and again have use for it.

I am an amateur canoeist in the full meaning of the term, yet I have never been so completely carried away with any kind of sport as I have with this. My canoe Idlewild is a member of my family, and is petted as a trusted friend.

You in the East are more giving to racing and the trials of finding what improbabilities a little 14×28 is capable of performing. The periodicals devoted to this branch of sport teem with articles on models, best makers, this or that sail, ballast or no ballast, with or without centerboards, etc. We hear little from actual cruises by amateurs, cruising outfits, etc. We are more given to cruising, and experience in that line—not intended to advertise a certain boat or fittings—would interest us. I reside forty miles from sailing waters and paddling surface is scarce; consequently I would like to read a description of the different cruising outfits. Such articles would interest more than me. I respectfully suggest to my brother paddlers that they give the outfit of their canoes ready for a cruise. In this manner many will gain new ideas for comfort, etc.

My next anticipated cruise will be in June, from Logansport, Ind., via Wabash River to the Ohio. If any of your readers can give me any pointers for the trip they will be thankfully received and duly acknowledged.

If my suggestion is acceptable, I will give the Idlewild kit and duffle description shortly. WILLIS D. MAIER.

FORT WAYNE, Ind.

MOHICAN C. C. held their monthly meeting Feb. 4. Commodore Oliver offered for the club races of 1885 prizes to be distributed at the end of the season, according to the record made by each canoe. They are (1) a cup for highest total in paddling and sailing races, (2) a flag for the same in sailing and (3) a flag for the same in paddling races. Highest average attainable in any one race 10, lowest 1. The Commodore has received his Marion B., a new Mohican No. 2. Turtle Mather's first canoe of the same build if fairly under way, and Secretary Fernow has followed suit by ordering also a new Mohican No. 2. —FERNOW.

RUSHTON'S CANOES.—We have received from Mr. J. H. Rushton, of Canton, N. Y., his new catalogue of boats and canoes. Since the last edition was issued, two years ago, many changes have been made in canoes and sails, as well as in rowboats, and the present book is much larger than any of its predecessors. It contains a description of Mr. Rushton's well known method of building, and also of the numerous varieties of boats and canoes built by him, and will be interesting to all boating men, while to canoeists it is specially valuable as a hand-book of their favorite craft.

A CRUISING CANOE WANTED.—After fifteen years' absence from salt water I have returned to the seaside, and am anxious to take up canoeing again. I want a good and safe sailing cruiser and will feel obliged if some correspondent will advise me as to the best dimensions of canoe for cruising, and its probable cost, also some particulars about the sneakbox which I have vainly sought for in Canada. Can they beat to windward, are they suitable for cruising, and where can one get a sneakbox built?—KANUCK.

CHICAGO C. C.—The first anniversary of the Chicago C. C. was held last week at the Matteson House, Chicago, the club and a number of guests sitting down to a dinner. The walls and table were handsomely decorated with flags, canoes and flowers. Speeches were made by the members and guests in praise of their favorite sport. The Commodore, Mr. G. M. Munger, spoke of the programme for this season, which will probably include a cruise on Eagle Waters, a chain of small lakes in Wisconsin.

BROOKLYN CANOE AND SAILING CLUB.—The officers of this club are: President, J. J. Hull; Vice-President, J. F. Newman; Commodore, R. J. Wilkin; Secretary, M. V. Brokaw.

"CANOE BUILDING FOR AMATEURS" *is now ready, and can be had at the office of the Forest and Stream, or will be sent by mail on receipt of* $1.50.

Answers to Correspondents.

B. W. F., Batavia, O.—I expect to do some duck shooting this spring, and wish to preserve some wings and parts of duck skins to be used for decorating ladies' bonnets. Please tell me the easiest and simplest method of doing this away from home and drug stores? Would like to know as soon as possible. Ans. The simplest way is to make a longitudinal incision on the inside of the wing, remove the flesh, powder well with arsenic, and sew together the skin with two or three stitches. Then fasten the wing with pins upon a board to dry, in the shape that you wish it to take. Parts of the breast and shoulders should be skinned away, the fat all removed, arsenic applied liberally, and the pieces of skin then be pinned to a board to dry.

TRAP SHOT.—The Ligowsky "Walking Match" conditions are: "Five traps screened to be placed at irregular points in front of the score, which must be placed 30yds. from furthest trap. The trap judge will prepare 13 folded slips of paper, containing each a number from 3 to 15 respectively, from which the shooter will draw one slip, which the judge will privately examine, and allow the puller only to see. The shooter is to walk in a general right line from the score toward the traps upon receiving the reply 'yes' from the puller to the query, 'Are you ready?' When the shooter is under way, the number of steps indicated on the drawn slip, the puller will pull any two traps, one after the other."

L. S. C., Palmerston, Ontario.—I have a pond of water about 100yds. long and 30yds. wide, and about 4ft. deep when full. I would like to have it stocked with carp if it is possible. For nine months of the year it has a strong stream of water flowing through it; for the other three months it has only about 18in. of almost stagnant water in it. Would carp thrive in the pond? I have been reading with great interest the remarks on the subject from your different correspondents in your valued paper. Could you put me in communication with any one who could furnish me with the necessary stock of carp? Ans. Write Prof. S. F. Baird, Washington, D. C.

W. W. H., Philadelphia, Pa.—The center of lateral resistance is the center of gravity of the immersed vertical longitudinal section, not the curved surface. The rudder should be included. The area can be calculated by dividing into triangles, or by Simpson's rule.

M. L. V., Savannah, Ga.—Steam vessels, however small, are under the same laws as the largest steamers, and must carry licensed engineer and pilot.

CUTTER.—Brockville, Canada.—The cutter will handle as easily as the centerboard boat as long as there is depth of water.

POT LUCK FROM EXCHANGES.

State conservancy of the pine forests, now rapidly disappearing, will protect a profitable industry within our borders; will secure ample revenue for the State Government, and will be largely contributory to the preservation of our important water courses. There is, certainly, no subject of greater importance for the consideration of the Legislature.—*St. Paul (Minn.) Pioneer Press.*

The Brunswick (Ga.) *Appeal* recently printed the following: "A party consisting of Dr. Blain, Messrs. William and Arthur Blain, Captain and Miss Prout, went out last Thursday for a grand deer hunt in the neighborhood of Mr. John Lamb's place. The party left early and had a big day of it. Some eight or ten deer were 'jumped' but only three killed, and, strange to relate, all of them by one person, W. S. Blain, and of them two were killed at a single shot."

The *Times* recently recorded the capture of a five-pound trout in Square Pond, Ellington, by a man fishing through the ice with tip-ups and live bait. The taking of trout through the ice is not uncommon in the Maine lakes, but in this section is of very rare occurrence. However, it appears that Connecticut trout have taken a sudden fancy to the skeleton like tip-up with its little scarlet flag and wriggling minnow. Mr. Warren Rowley, of North Main street, tried ice fishing Monday, on the Wapping pond, and among his catches was a speckled brook trout weighing three-quarters of a pound.—*Hartford (Conn.) Times Jan.* 28.

"Highest Quality" Fish HooKs.

Anglers are so familiar with our name and Trade Mark and the quality of our goods, that we have no hesitation in calling them to witness to the excellence of all hooks made by us. Though our hooks have always been fully equal to any ever made, about five years ago we came to the conclusion that anglers would welcome a very high grade of fish hooks—something far beyond what they had ever used. Consequently we perfected arrangements for the manufacture of what has become so widely and favorably known as "Abbey & Imbrie's Highest Quality" fish hooks. All boxes containing these hooks have our trade mark and the words "Abbey & Imbrie's Highest Quality," distinctly printed on the label. Also the name of the hook, viz.: "Sproat," "O'Shaughnessey," "Aberdeen" "Carlisle," "Sneck Kendall," or "American Trout." When "snelled" on silk worm gut or gimp the hooks are put up in packages containing one-half dozen of hooks. Each one-half dozen is labeled.

If your dealer does not keep our goods in stock, or will not order them for you, send us 50 cents for our 180-page illustrated catalogue.

SEND FOR CATALOGUE.

Explanatory and Suggestive.

FOR THE CASUAL READER.

Arma virumque cano—"Arms and the man I sing." And, indeed, it would take the genius of a Virgil and the roll of Latin hexameters fitly to tell the deeds of this man, whose arms are shotgun and fishing rod. Go where you will, he is there. You run into him on the crowded city street, encounter him on cars and steamboats; he perches atop the country stage, bestrides the burro, and doubles up like a jacknife in the kanim. Seek out the most distant, most tortuous streams, his line has been wet in their waters; penetrate into the wilderness, the tin can of the sportsman's camp is yet further on. He goes for game—if the fates shall send anything within reach of his ammunition; for fish—if by good fortune a trout shall rise to his fly or descend to his worm. But, good luck or bad luck, game or no game, fish or no fish—fun always, fresh air, ozone, quicker pulse beat, brighter eye, more elastic step, all the multitudinous rewards, which, after all, outweigh the biggest "bags," and tip up the longest "strings." Is it not true that only a poet could tell his deeds as they ought to be told? Perhaps so. Perhaps not. He can usually tell them himself. And he does, with a thousand different pens, in a thousand different ways.

You may read it in the FOREST AND STREAM.

And that is better than if it were put into verse between book covers.

One who does not understand these things might imagine that after being told so often, this story of the man—him with the rod and gun—might in the end become hackneyed. But it is not so. Why? Well for pretty much the same reason, we venture to say, that the fields themselves and the woods and the lakes and the streams never become hackneyed. However that may be, one thing is certain. Our columns every week, and month after month, give ample proof that there is still an abundance to tell of what is seen and what is done afield and on angling waters; and that hosts of people still delight to read the telling, our subscription books show with ever increasing emphasis. The FOREST AND STREAM is in the best sense

A Journal of Recreation.

It tells of the recreation found by busy men, in out-door, open-air life. It *is* recreation to these same men and to others. Explain it how you will, this recreation found in the pages of the FOREST AND STREAM is different from the diversion afforded by other papers. Why? Because (it may be answered again) the recreations of field and stream are always ten times more potent for good than are those found in almost any other way.

Look through the pages and you will see that the departments include a pretty large field. It is a wide scope of subjects. But if you look carefully you will see that the paper, from front cover to back cover is homogeneous. What is in it belongs in it. There is not the mistake of trying to foist upon the reader, who is interested in angling and shooting, a lot of stuff about horse racing or base ball or prize fights. There is no sawdust-ring odor. Everything is redolent of the woods. There are plenty of other papers devoted to the other subjects. If you are interested in them, you need hardly spend time to read the rest of this explanatory advertisement. The FOREST AND STREAM'S field is broad, but it is not broad enough to take in all creation. The editors are perfectly contented with the scope of the paper as it is at present. And now

A Word About 1885.

For fifty-two weeks of the year 1885 we propose to publish the FOREST AND STREAM, and to fill each number with the same rich abundance and variety of reading that may be found in this present number or in any one of the five hundred numbers that have gone before it.

There will be the same delightful accounts of the adventures and misadventures of the *Sportsman Tourist*, and whether the "tour" be across a continent or only across the pasture lot into the woods beyond, the story in either case will be well worth the time it takes to read it. We shall have, now and then, a description of such excursions in foreign lands, but for the most part these columns will deal with what is seen and done in our own country, for that, after all, is what the readers of FOREST AND STREAM are rightly presumed to be most interested in.

The *Natural History* columns will give attention to varied forms of animal life, more particularly such as may come under the observation of sportsmen in their rambles. This department of the FOREST AND STREAM we believe to hold a place altogether unique. It is neither the dime-museum sort of un-natural history affected by the newspapers, nor the abstruse, fine-spun and terribly dry lucubrations of the scientific associations. It is intelligent talk about animal life, intended for intelligent readers.

In the *Shooting* and *Angling* columns (we need hardly say it) will be accounts of hunting excursions and fishing trips—with luck, good, bad and indifferent; discussions about matters mechanical, ethical, sentimental, fanciful and practical; some, after much debating, will be settled; others will be left (and the reader with them) at the end just where they were at the beginning.

The *Kennel* will give in 1885 (as it has given in 1884) the earliest, most accurate and the only unbiased reports of shows and trials, and it will be the endeavor of the editors to maintain for the FOREST AND STREAM in this special branch the position it now holds away in advance of anything else published in this country.

The *Yachting* columns are in charge of an expert, whose highest ambition will be to keep these departments in the place already won for them in the recognized lead of journalism. Though the *Canoeing* interest of the country is of comparatively recent growth, the FOREST AND STREAM fully appreciating its importance, has provided for those who sail or paddle a (pretty generous) corner, which is so full of practical suggestions and recountings of cruising experiences, that a canoeist might almost as well try to get along without a paddle as without the paper in his mail every week.

In a word—this is what we started out to say—in 1885 the FOREST AND STREAM will be newsy, bright, wholesome—a journal of out-door recreation.

Terms:—$4 per year, $2 six mos., 10cts. per copy. Sold everywhere. Make orders payable,

CHAPMAN'S BAITS STILL AHEAD!

"THE NEW COMBINATION," Just Out. See Cut.

(Patent Applied For and Allowed.)

In Three Sizes for PIKE, PICKEREL, BASS, TROUT & MUSCALONGE.

Read the Testimonials:

Chicago & Northwestern Railroad Depot, Chicago, Ill., Jan. 12, 1885.

W. D. Chapman & Son, Theresa, N. Y.:

As an old fisherman who has used your baits for the past twenty-five years, allow me to congratulate you on the success of your New Combination Bait for trout, muscalonge and bass.

It is very attractive, as the record of catches in Wisconsin last fall will show. I consider it the best bait in its different sizes made, and predict for it the largest sale of any bait ever made.

Yours truly, A. G. RYTHER.

Chicago & Northwestern Railroad Company, Milwaukee, Wis., Jan. 1, 1885.

W. D. Chapman & Son, Theresa, N. Y.:

I take pleasure in testifying to the great merits of your New Combination Muscalonge Bait.

I gave them a good trial the 1st of last November and caught thirteen muscalonge in two and one-half days' fishing, without the loss of a fish, and two of the thirteen weighed over twenty pounds each. You will have a large demand for these baits; sportsmen must have them.

Yours very truly, JOHN S. GEORGE.

To introduce these Baits at once, we will send by mail upon receipt of price:

No. 1.—Largest size, for Salmon, Trout and Muscalonge, $1.50. **No. 2.**—See cut, for Pickerel, Pike, Bass and Trout, $1.25.
No. 3.—Sure death to Bass, $1.00. All three sizes to one address, $3.50. **Try them at once.**

Catalogue and Price List to Dealers. Send Business Card. Catalogue to Sportsmen, without prices. 100 kinds of Baits.

MENTION THIS PAPER AND ADDRESS **W. D. Chapman & Son, Theresa, N. Y.**

SEEDS

OUR ILLUSTRATED CATALOGUE FOR 1885, OF

PETER HENDERSON & CO.,
35 & 37 CORTLANDT STREET, NEW YORK.

PLANTS

Publications.

THE

This important work, now for the first time offered to the public, contains full life histories of all the quadrupeds of this State. These biographies are as different as possible from those too often found in scientific works; instead of being dry and dull

MAMMALS

they breathe the very fragrance of the woods and fields, and give us a close insight into the every-day life of their shy inhabitants. To the lover of nature the work commends itself by its title. The hunter will need it for the complete account it gives of the habits of the deer, the hares and the

OF

squirrels. The farmer should read it because it tells him all about his enemies, the shrews and field mice who devour his crops, and about their enemies whom he would like to protect.

NEW YORK.

This interesting work is published in two volumes, the first taking the reader from the *Carnivora* (flesheaters) to the *Cervidæ* (deer), and the second concluding the subject.

BY

C. H. MERRIAM, M.D.

The volumes are superbly gotten up and are printed in large, clear type on heavy tinted paper.

We offer a few copies for sale at the following prices: Single volumes, paper, $2 each. The two volumes, paper, $3.50. The two volumes, cloth, $5.

Forest and Stream Pub. Co.,
39 Park Row, New York.

For Sale.

FOR SALE.

The ever reliable river St. Marguerite, the chief tributary of the Saguenay, descending from a lake far north of Chicoutimi, and famous for its salmon and sea trout fisheries, with all the proprietor's riparian rights, is now offered for sale. The St. Marguerite is distant 15 miles from Tadousac by water, or 10 miles over land. The riparian rights cover a distance of 30 miles, which is sub-divided into six sections, 5 miles apart. At each section are erected one commodious Gothic cottage, men's house, ice house, etc., etc. Each section has the control of six to eight salmon pools. Parties desirous of forming a club to secure the rights of the above valuable salmon stream, can so arrange it whereby twenty-four rods could have equal rights and splendid sport. For further particulars apply to WILLIS RUSSELL, Proprietor, Quebec, Canada, or to Messrs. GRANT BROS., 2 Exchange Court, New York City. jan8,7t

Gordon Setter "ARGUS."

Argus is thoroughly trained for field work; has an excellent nose and great endurance. The following are his bench show winnings: 1st prize in Toronto, puppy class, 1880; 2d prize, London, 1881; 1st prize, Cleveland, also special for best Gordon setter exhibited, 1882, 1st prize, champion, Ottawa, 1883; 1st prize, champion, Chicago, 1883; 1st prize, Montreal, and special for best Gordon setter F, 1883; 1st, champion, Loudon, also special for best Gordon setter dog in show, and special for best Gordon setter dog or bitch, 1883.

Argus has been awarded prizes under the following judges:—John Davidson, Major J. M. Taylor, Harry Malcolm, James Watson, W. J. Munson.

Stud Fee, $25.00.

STUD FOX-TERRIER

Champion Raby Tyrant,

(K.C.S.B. 11,179.)

Pupped October, 1880. Weight 16½ pounds.

Raby Tyrant is a white dog, with an even marked rich black and tan head. He is a thoroughly game and stylish terrier, possessing a beautifully shaped long punishing head, with perfect drop ears, small eye, rare neck and shoulders, deep chest, well ribbed and muscular quarters, short, straight legs, excellent feet, great bone and substance, with an exceptionally hard and dense coat.

Raby Tyrant is without doubt one of the most successful terriers of the present day. He has been exhibited 67 times, 33 different judges having adjudicated upon him, and has won 47. First 10 cups and specials; 12 second and 2 third prizes. His breeding is undeniable, combining as he does the choicest and most valuable blood that can be obtained. At the stud Raby Tyrant is proving himself eminently successful.

Fee, $15.00.

JOHN E. THAYER, Hillside Kennels, Lancaster, Mass.

BEAUFORT.

(Champion Bow—Beulah.)

The best-looking pointer dog living and a great stud dog. CHAS. H. MASON, 255 West Twenty-second street, New York City.

CHIEF.

Will serve red Irish setter bitches of pure blood and guaranteed field quality. Fee, $25.

For Sale—Puppies, by Chief. Stock and field quality of dams guaranteed. MAX WENZEL, 89 Fourth street, Hoboken, N. J.

TED LLEWELLIN.

Blue belton (A.K.R. 599) Druid—Gessie. Gessie, by Dash III. ex Modjeska. Modjeska, by Leicester ex Peeress. A magnificent field dog and winner of 2d in 18 mos. class, N. Y., 1883. Stud fee moderate. WALTER B. PEET, Station M., New York City. jan22,3mo

Vandevort's Don in the Stud.

To a limited number of approved bitches. For particulars and pedigree address R. T. VANDEVORT, Homewood avenue, East End, Pittsburgh Pa. Fee $50.

K. K. C Liver and White **POINTER**
CHAMPION **KNICKERBOCKER** (A.K.R. 19)

In the Stud. Young stock for sale.

GEO. L. WILMS, Sec'y. 142 Monticello avenue, Jersey City, N. J.

JOKER JR., A LIVER AND WHITE TICKED pointer, by Beaufort out of Nymph (Viscount—Dolly), the best son of Beaufort I have ever seen. A dog of extra nose, superb style, great staunchness and endurance. Stud fee $25. G. H. NIXON, Leesburg, Va. feb12,4t

The Celebrated Champ. Pointer Fritz

(Beaufort—Spot), (A.K.R. 1351), in the stud. Fee $25. C. W. LITTLEJOHN, Leesburg, Va. feb12,3mo

THE

ACME RUST PREVENTATIVE

Guaranteed to be the best article yet discovered for the prevention of rust on fire arms, tools and all metal surfaces when directions are followed. Specially adapted to guns used near the salt water. Samples mailed to any part of the United States and Canada on receipt of price, 15 and 25 cents. Satisfaction guaranteed or money refunded. Address E. VANDERWERKEN & CO., Stamford, Ct

The Kennel.

Chequasset Kennels.

Thoroughbred St. Bernards, rough and smooth-coated. Thoroughbred English pugs. A few choice pups on sale. Hermit, imported rough St. Bernard, fee $35; Young Toby, imported English pug, fee $15; Treasure, English pug, fee $15. Address with stamp, P. O. Box 94, Lancaster, Mass.

GREYHOUND FOR SALE.

Thoroughbred English greyhound Fritz, whelped Nov. 8, 1884, by Miller's imported Blonde (now owned by undersigned) out of Calypso; grandsire, Master McGrath, the best known greyhound in England; color, mouse. Price $50. Any gentleman wishing a beautiful greyhound can here find it at an unusually low price. Will stand when grown about 30in. at shoulders. SETH O. ROGERS, Bath, Me. feb12,4t

ENGLISH BEAGLE HOUND PUPPIES.—FOR Sale—Extra fine puppies (either sex) at from $10 to $15, according to age and quality; some several months old. Address N. ELMORE, Granby, Conn. nov13,tf

FOR SALE CHEAP.—ONE GOOD 'COON DOG, two beagle bitches, 11 mos. old, very extra hunters for young dogs, For price, etc., address Box 66, Littleton, N. H. feb12,2t

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, FEBRUARY 19, 1885.

VOL. XXIV.—No. 4. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. Newsdealers in the United Kingdom may order through Davies & Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, London, Eng.

Address all communications,

PLEASANT FOR NORTH CAROLINIANS.

IN another column will be found a notice of a proposed change in the North Carolina game law. The proposition to throw open the waters of Currituck and Albemarle sounds to the battery-shooters from here, there and everywhere, will be something of a surprise to the residents of the old North State. Whether it will be a pleasant surprise or not we leave to them to say. The project having originated with Mr. Forbes, who, we may presume, is a resident of that State, is hailed with delight by the Northern gunners and marketmen, who have hitherto been kept out of these waters by the non-resident law, which we explained in our issue of Dec. 18, 1884. To these people such a change means, for a while, plenty of fowl. They do not realize that the greater number of birds sent to market means also lower prices for them. They imagine that for a time they are going to make a great deal of money, and they do not look very far ahead.

The residents of the seaboard counties of North Carolina will not feel very grateful to Mr. Forbes for his proposal to change the law. To them it is a much more serious matter than to any other class. Most of them are poor men who, during spring and fall, earn their living by fishing, and in winter depend on their guns. They sell the canvasbacks which they kill, and the sale of a few pairs of these birds helps them greatly at the season when there is no other work. If the law is altered as is proposed, there will be little chance for these men to earn their few dollars by killing fowl. Northern gunners will descend on Currituck Sound in hordes, and its waters will be covered with batteries. The birds, which of late years have been diminishing in numbers, will be fairly driven away to seek other homes, we know not where.

The naïve remarks on the proposed modification of the law, which we print elsewhere, are a suggestive commentary upon it which we commend to the careful consideration of those of our readers whom the alteration would most affect.

Will the members of the clubs on Currituck Sound find the proposed change a pleasant one? We think not. It is true that such a law would enable them to shoot out of batteries, but in a very short time after such a change there would be little object in lying in a battery, for the birds would all be gone. While the matter is one which touches nearly the various clubs who own large, and at present, valuable properties on Currituck Sound, their members would at least be able to move to other localities in different parts of the country, where shooting can still be had. Their pockets would suffer and their feelings would be hurt, but they would not have to endure any real hardship. To the residents of these shores, on the other hand, the passage of such a law would mean serious pecuniary loss. They would be absolutely deprived of the chance of earning a few dollars at a season when work and dollars are scarce with them.

These native gunners would be the most serious sufferers by such a modification of the laws, and our sympathies are altogether with them, but the middlemen and traders who buy and sell fowl along the Sound would also be considerable losers since the Northern gunners, hired by the marketmen, would ship their fowl direct to their employers.

Besides this, when the clubs had moved away, as they certainly would do, should the waters be opened to non-resident shooters, the State would be deprived of a large sum in taxes, and the various tradespeople would lose a large and constantly increasing winter custom, which at present forms a very considerable item in their yearly business. These points should be considered by the residents of the counties which such a change would affect.

We do not know how far this bill is advanced, nor what prospect there is of its passage, but it would seem that if the consequences to the State and its inhabitants were clearly set forth in the Legislature the bill would be at once thrown out.

It is reported that money is to be used to attempt to secure its passage, and on the whole it seems quite clear that there is need of energetic work among the dwellers along the Sound shore and throughout the State, to prevent the passage of so ruinous a bill.

It is difficult to understand the motive which has actuated Mr. Forbes in setting on foot such a mischievous piece of legislation. He professes sympathy with the club members and yet takes a course which would, if carried through, render their properties valueless, and at the same time he is doing something which will bring serious loss on and will be a real hardship to a large class of the residents of his own State.

THE NEW HAVEN SHOW.

THE first important dog show of the year will open at New Haven, March 18. That given last spring by the New Haven Kennel Club, and managed by Mr. E. S. Porter, its secretary, was in many respects one of the best shows ever held in this country. There is every reason to believe that the coming one will be even more creditable.

In the selection of their judges the New Haven Kennel Club has shown good judgment. Mr. Davidson—better known as "Honest John Davidson"—has had a long experience with pointers and setters, and Messrs. Mason and Watson are recognized as very high authorities on the different breeds which have been assigned to them. Mr. Westcott has imported and bred setters which have taken highest honors on the show bench, but he is comparatively untried in the judging ring. What is of even more importance than their experience is the fact that the judges are men of independence, about whom it may be asserted that no motive of favor or fear can influence their decisions. It may be confidently predicted that the dogs will be judged on their merits as they appear in the ring, not upon what they have been or upon what it is hoped they may become.

Upon several of the gentlemen selected to judge at New Haven savage attacks by insinuation and innuendo have been made. The abuse which has been showered upon them was not of akind to do any one great harm. There was a great deal of noise about it, but nothing more injurious than wind. *Vox et præterea nihil.* We have always known there was not the slightest foundation for these bitter assaults upon the character of gentlemen of unblemished reputation, and their appearance in the judging ring at so important a show as New Haven, proves conclusively that now the public knows it too. This is a most encouraging state of things and one which will give great satisfaction to those who have at heart the bestinterest of our dogs.

The New Haven Kennel Club has shown in this matter as in others, that it is managed by cool, clear-headed men, whose judgment, independence and firmness are a sufficient guarantee of their success. Such men, knowing the right and determined to perform it, may be relied on to raise dog shows above the level on which they stand at present. Events still fresh in the memory of all, indicate the need of some such elevation. It is to be hoped that American sportsmen and breeders may not again be humiliated by occurrences such as have taken place within the past twelve months.

The New Haven Kennel Club is further to be congratulated upon having had the independence to hold to the three championship rule, ignoring the most recent "construction" of Rule 8 of the A. K. C., as well as the ridiculous extra champion class. On this subject we have already expressed our views, and it is unnecessary to expand them further. It is to be hoped that the New England and other kennel clubs may follow in the path so clearly marked out, and that all quibbles and jugglery of the rules may be sternly frowned down. If this is done, and an open and fair course pursued, the American Kennel Club may do a good work for our dogs and dog shows. But if trickery and unfair dealing get the upper hand, nothing is more certain than that it will be necessary before long to write the obituary record of that association.

THE PARK BILL IN CONGRESS.

THE amended bill for the enlargement and better protection of the Yellowstone National Park has passed the House of Representatives and now comes up before the Senate.

No one in that body knows better than Senator Vest the importance of bringing the bill to a vote at once, so that it can be passed this session and receive the signature of President Arthur who, having been in the Park, realizes something of its needs. It is believed that this can be done. The bill is short and simple, and during the debate in the Senate a year ago it was very fully discussed, so that the Senators may be presumed to know what it contains.

The changes that have been made in it in the House are unimportant as affecting the main purpose of the bill, that is, the better protection of the Park. These changes consist in making the Yellowstone River and the East Fork of that stream the northern boundary of the Park, in part, and in transferring the jurisdiction over the reservation from Montana to Wyoming, within which Territory it is located. The first named change cuts off from the reservation an unimportant corner, which contains no special features of interest, but does include a part of Clark's Fork mines, in which a considerable number of people are pecuniarily interested, while the transfer of jurisdiction to Wyoming seems on all accounts eminently proper.

There is no opposition to the bill on any hand. It is generally acknowledged to be a measure which ought to be passsed. If it should fail, it will be only because of the very short time between this and the close of the session.

The bill is now in the hands of a conference committee of the House and the Senate.

Those who are interested in the Park have worked now for several years in the hope of obtaining some law which should serve to give the reservation the care that so important a region deserves. At last they see success almost within their reach.

A few days will determine whether the bill is to become a law. We think that it will.

THE A. K. C. RULES.

A CRITICISM of the rules of the American Kennel Club by the editor of the *Register*, will be found in another column. The remarks upon them will be read with interest, for the matter is one which is interesting to all who own good dogs.

The most curious thing about these rules is the apparent carelessness with which they were drawn up. They seem, in fact, to be little more than the show rules of local clubs, and the principles which should govern dog shows are curiously mixed up with attempted formulæ concerning various minor and special details.

Such crude and imperfect rules having been submitted by the committee, and not repudiated by the club, it is not very surprising that Major Taylor should have taken it for granted that his construction of Rule 8, which has suddenly become so famous, would be accepted. The assumption indicates that he places a very low estimate on the intelligence of his fellow members, and we have sufficient confidence in the common sense of the clubs which compose the American Kennel Club to believe that a majority of them will cut loose from this interpretation of the rules.

THE DEER HOUNDING BILL.

THE bill introduced into the Assembly by Gen. N. M. Curtis provides for the abolition of deer hounding in this State at all seasons. The full text of the bill is as follows:

Section 1. No person shall hunt or pursue any wild deer in this State with any dog or bitch. If any dog or bitch shall be found so hunting or pursuing in the State, it shall be *prima facie* evidence of the violation of the foregoing provision of this section by the owners of, or person or persons having or harboring such dog or bitch. Any person offending against any of the provisions of this section shall be guilty of a misdemeanor, and in addition thereto shall be liable to a penalty of fifty dollars for each and every such violation, to be sued for and recovered as provided by chapter five hundred and thirty-four of the laws of eighteen hundred and seventy-nine, as amended, for the recovery of the penalties thereby imposed.

Sec. 2. No person shall be excused from giving evidence upon an investigation before a grand jury, or before any officer or officers authorized to conduct an investigation or examination as to the commission of any offense under this act, or under any of the provisions of chapter five hundred and thirty-four of the laws of eighteen hundred and seventy-nine, as amended, or upon any prosecution therefor, or in any action to recover any of the fines or penalties in either of said acts mentioned, on the ground that the evidence might implicate, or tend to implicate, or convict, or tend to convict him or her of a crime or misdemeanor; but such evidence shall not be received against him or her in any civil or criminal action or proceeding.

Sec. 3. This act shall take effect immediately.

This bill has been referred back from the Committee on Game Laws, and it is hoped, will soon be brought up for a vote before the Assembly. It should receive prompt attention and hearty support. The residents of the Adirondacks and the intelligent visitors to that region are urgent in demanding such a law as that proposed by Gen. Curtis. Among all the game bills at Albany this is the one that should without any hesitation or needless delay be sent to the Governor for his signature.

All possible outside influence should be brought to bear in favor of the passage of the Curtis bill. Let it be made known to the members that while on other points of game legislation there may be diversity of opinion, on this one subject, the abolition of deer hounding, there is practical unanimity.

The Curtis bill ought to become a law.

DOGS, DEER AND FAWNS.

LOOKED at in almost any aspect, the hounding of deer in the Adirondacks is abominable; but in one particular light it is peculiarly atrocious. This is in its effect upon the natural increase of the game.

Guides and old visitors to the North Woods say that the proportion of barren does to those with fawns is constantly increasing. To-day the relative number is very greatly in excess of what it was ten years ago. This is due to hounding. Hounding is practiced in the breeding season. The does are in a state of constant excitement and fear of the hounds. Under such conditions, according to a principle well-known to all physiologists, and familiar to all stockmen, the does will not conceive. There is no speculation about this. The facts are well established, and are recognized by breeders of horses and cattle. Gen. N. M. Curtis, who was, we believe, the first person to recognize that this law holds good with respect to deer, is himself a successful stock raiser. When his attention was first called to the practice of Adirondack deer hounding, he at once saw here the application of the principles governing a stock farm. Somewhat extended investigation has since proved the correctness of his views. It is beyond cavil that the barren does are increasing, and equally beyond question that the practice of hounding is responsible for it.

Common sense demands that hounding should be forbidden by law.

THE GAME DEALERS' BILL.

THE game dealers have huge refrigerators in which they can store game and keep it indefinitely. They are very anxious now to have license to cram these warehouses with all the game they can secure in the open season and then to sell it in the close season.

They are also anxious to arrange the laws so that the cold-storage warehouses can be utilized to cloak the traffic in game killed out of season.

When they gain the right to load up their refrigerators with the spoils secured by the market-hunters in the open season, and the opportunity to receive and dispose of game killed wherever it can be killed by the market-hunters in the close season, they will be satisfied.

They set out to do this some years ago. The services of a New York lawyer were secured. He was ostensibly an ardent game protector; and under his engineering the famous, or infamous, refrigerator amendment was put forward as if coming from the Long Island sportsmen. This was a cunning scheme, but we exposed the nature of the bill, and it was killed. The next year a like bill was presented, and this was also killed.

The other day the game dealers, apparently distrusting their "sportsmen" allies, formed a society of their own, and in a half-horse and half-alligator title for it announced that it was for the protection of game and game dealers. The game protection part was rank hypocrisy. The game dealer protection part was sincere. They subscribed a fund of money, hired a lawyer, and have prepared a bill which was introduced by Mr. Church, of Queens, last Tuesday. This makes it allowable to sell game all the year around, provided it be killed outside of the State. The latter clause is intended to blind the public. With such a law the game of this State will be sold whenever it can be captured. The Adirondack deer, the Long Island woodcock, the grouse and the quail will be given no rest until exterminated. The Church bill is iniquitous. It ought never to come back from the committee.

A Forestry Convention will be held at Utica, N. Y., next Saturday. It is called by a number of well known gentlemen, who are awake to the urgent necessity of some action for securing forestry reform. President White of Cornell will preside, and a number of gentlemen will speak. The secretary of the committee is Mr. B. E. Fernow, 13 Burling Slip, New York city. All who are interested in the subject are invited to be present at Utica.

Dr. Arnold's Gibe at Walton for having fished through the turmoils of his time might be applied to our correspondent "Wawayanda," who forsook the battle ground last year and went off to fish in the backwoods of Canada.

Long Island.—A bill has been introduced at Albany, by Mr. Otis, prohibiting non-residents in Queens and Suffolk counties, not owning lands therein, from shooting game there except by permit of a justice of the peace and $10 license.

Thunder Before Rain.—Messrs. Carver and Bogardus have been having a tremendous newspaper war. They have been lavish of thunder, so that the rain (of shekels into their pockets) may be bounteous.

Death of B. B. Hotchkiss.—A cable dispatch from Paris on Saturday last announced the death in that city, of Mr. B. B. Hotchkiss, well known in connection with fire-arm invention.

Notices sent to the A. K. R., if intended for the Forest and Stream, should be sent to the latter on separate sheets of paper. The two publications are separate and distinct.

National Gun Association.—As will be seen by reference to our Trap columns, the National Gun Association was organized at New Orleans last week.

The Michigan Association Meeting was erroneously announced in our last issue to have been held Feb. 10. Instead, it was postponed to Feb. 17.

Don't Roll Manuscript. Fold it.

THROUGH TWO-OCEAN PASS.

IV.—HOT SPRINGS AND PAINT POTS.

OUR first camp on the lake was to be the headquarters, from which various minor excursions into the surrounding country were to be made. The longest and most important of these was to be undertaken by Mr. Hague, who proposed to cross the Continental Divide to the Pacific slope, follow down one of the forks of Snake River to Jackson's Hole, and then return by an unexplored route over Two-Ocean Pass to the lake. With this party I was to go. Our first camp after leaving headquarters was to be at the hot springs at the head of the West Arm, about eighteen miles further on. The wagon road ends at Topping's cabin, but there is a good trail leading along the shore of the lake, the general direction being southward and westward.

About four miles from the main camp is a natural bridge spanning a brook, insignificant in summer, but which in spring carries considerable water. The stream has burrowed its way beneath a dyke of lava (rhyolite) at right angles to its course, and is bridged by a nearly perfect arch of this rock, which is about six feet thick above the keystone. From the top of the bridge to the stream bed on the lower side is about sixty feet. The bridge is perhaps twenty-five feet long and the arch fifteen in width. The lava stands in vertical layers from one to four feet in thickness, having apparently separated in cooling into these thin plates. Beyond the bridge the trail led for the most part through the pleasant green timber.

During the day's march we saw a practical illustration of the importance of forest preservation, which was no less striking than instructive. About midday we passed over several hogbacks from which the timber had been burned off. This had taken place long ago, for almost all the tree-trunks had mouldered away and only a few charred fragments of the resinous and almost indestructible roots remained on the ground. For some reason no young growth had sprung up to replace the old, and the ground was bare of timber. And not of timber alone. Exposed for years to the full force of the weather, the rains and melting snows had swept away all the humus, or soil, leaving only the coarse rhyolitic sand, composed wholly of inorganic matter, and so affording no support for any vegetation. These hogbacks, dry and desolate, resembled, therefore, some of the arid wastes of thirsty Nevada. The tract was a little desert in the midst of the pine forest. This is what may be expected if the fires, easily kindled and so common in this region, are allowed to destroy the timber. The forest gone, it follows that the waters sweep from the surface of the ground, first the forest floor and at length every particle of soil, without which neither tree nor shrub nor grass nor weed can grow. The land becomes barren. Springs and brooks first, and then lakes and rivers grow smaller, and at length disappear, and the great farming regions on either side of the mountains which are largely dependent on irrigation, by means of the streams which flow from them, become valueless to the settler.

About eight miles beyond the natural bridge we turned off from the main trail to the left, and followed a little stream down to the lake shore. From the top of a high sandbluff above the beach we looked out upon a most lovely view. To the left was a quiet lagoon, scarcely ruffled by the fresh wind, while without its bar the whitening waves dashed themselves against the beach with a tumultuous roar. Beyond, the waters were deep, dark blue, like those of the ocean beyond soundings. To the east, southeast and south were the mountains; the Sierra Shoshone, the nearest and most clearly seen, heavily patched with snow and rough with ragged, saw-toothed ridges. Next came the mountains of the Upper Yellowstone, then Sheridan superbly white, and far away to the southward, just visible through a notch in the mountains, a portion of the huge mass of the Teton Range, with one of the Grand Needles in sight. Far to the right could be seen the white jet of steam from the boiling springs, toward which we were journeying. Everywhere over the lower land, and often creeping up adventurously to the very feet of the snowdrifts, was the smooth, dark green of the pines. On the blue water to the left, a snowy pelican was gliding along smoothly and majestically, while nearer still, and just without the line of white surf, floated a flock of redhead ducks. Above in the blue sky three ospreys swung to and fro in broad circles, and screamed to one another in plaintive tones.

Over the most of this trail travel is very good, and it needs little more than cutting out to make a good wagon road About four miles from the springs, however, there is a high and steep hill which is rather hard for the horses, but about which a good road might be made.

The hot springs at the head of the West Arm of Yellowstone Lake are an interesting and very considerable group. These resemble in all their essentials those of the Geyser Basins, but there are not, so far as known, any considerable geysers among them. The number of the active springs, however, is very great, and the area covered by them is large. This group once evidently extended much further into the lake than it now does, and the beach and lake bottom near the shore is composed wholly of fragments of shining white geyserite. Against this white bottom, as we rode toward camp, we could see many trout, each a foot or more in length, lying at rest. In some places the waves have worn away the shore line so that frequently the bluffs of geyserite ten to twelve feet in height are scalloped thus ~~~~~~~~~~ and eaten away at their base to a depth of four or five feet. Quite a number of the springs are situated on points of rock which extend some little distance out into the lake, and such points, that is those where active hot springs exist, do not seem to be at all affected by the action of the waves of the lake, as is the rock where the springs have become extinct

In one of these springs, which is sometimes known as the Fishpot Spring, and which has been figured in all the guide books of the region, one of our company performed the often described act of catching a trout from the lake, lifting it out of the water, and without removing it from the hook, dropping it into the spring, where it was to cook. After being in the water for a few moments, the head had boiled away and the skin split, and when it was then removed, it was found to be thoroughly cooked for more than one-quarter of an inch in from the skin. We all agreed that it was an experiment not to be repeated, for the fish seemed to suffer for a minute or two before it died, and for a little while longer there were occasional convulsive struggles or quiverings as if the creature were still alive. These were probably mere muscular contractions, however, for the temperature of the water was 165° Fahr.

A part of the next day was devoted to an examination of the hot springs. Most of them are within a few hundred yards of the lake shore, and the openings of several are out in the lake under water. They are various in character, some of them being merely large, quiet pools of heated water, while others, usually smaller, boil vigorously at irregular intervals. There is also a group of mud puffs not far from the lake shore.

The temperature of the different springs varies greatly. Of those extending out into the lake, the largest to the east has a temperature of 130° to 133° Fahr. A very small boiling spring to the west of this with a double orifice formed by a bar of geyserite stretching across its mouth, gave a temperature of 195°. This spring boils almost constantly, and the water is usually above the bar, but sometimes sinks three or four inches below it, and then rises suddenly, throwing out jets to a height of two feet or more. It thus seems quite like a tiny geyser, and in its operation reminds one of the Fountain of the Lower Basin, though on so much smaller a scale. During one ebullition the water was sent up constantly to a height of 15 or 18 inches, with occasional jets twice as high. The force appeared to be central, and the water spread out in the shape of an umbrella. This display

lasted 14 minutes, when the water suddenly receded to about 6 inches below the top of the partition. Another spring, a quiet, deep, green pool, also on the margin of the lake, and indeed, projecting out into it, gives off a little steam at 9 A. M., and has a temperature of 158°. This is the one next west of the "Fish Pot." West of that is another still green pool, giving 159°. The temperature of the lake water is quite uniformly 57° to 58°, except in the immediate vicinity of outlets from the various springs, where, of course, it is higher, sometimes being 70° to 71°.

Back from the lake shore are the larger springs, both quiet and pulsating. They are of lovely colors, usually of the purest palest blue, but sometimes green and yellow, and with their borders beautifully beaded and scalloped with delicate margins of geyserite, and their outlets red and brown with the curious viandite. The highest temperature of any of them was found to be 199° at a moderately large geyser-like spring, to the right of the trail, with a raised crater ten inches high and eighteen in thickness. In this the water boils with great violence at its western side at frequent intervals. Its closely adjacent pool is agitated sympathetically on its eastern side. A number of the springs back from the lake shore were examined and gave temperatures from 178° to 192°. There are others in which it is by no means so high; these being apparently dying.

An attractive group of mud puffs or paint pots lie a short distance back from the lake, and just east of a number of large hot springs on the upper or southwest side of the deposit of geyserite. The basin in which these mud puffs are situated is about fifty feet in diameter, and contains, perhaps, forty mud springs, most of which have built up for themselves considerable cones. Besides this there are about the border of the basin several small steam vents from which the colorless super-heated steam is constantly discharged with a sharp, hissing sound.

The mud of these "paint pots" is exceedingly smooth, finely divided and free from grit. It has two principal colors and varies from a dark slate gray to the palest possible lilac, and from a deep pink—almost an orange—to a pale salmon color, and so on to white. In the largest pot of all the clay is extremely stiff, almost like putty, and the puffing of the steam through it is therefore very slow and labored. There are many cones two or three feet in height, which now contain in the hard dry crater a single tiny orifice, in which the mud is still soft and boiling, and others in which even this action has ceased. In some of the smaller pots the mud is shot up at frequent intervals four or five feet into the air, and sometimes much higher.

To the west of the camp there is a considerable area which has in the past been the scene of vigorous hot spring action. Almost all of these springs are now extinct. The pine forest has grown up over the deposit of geyserite, the craters of the springs are dry, moss-covered, and often partially filled with the debris from the forest, over which grow delicate pale green ferns and grasses. The extent and thickness of this deposit is very great.

At the border of the lake and overlaid by eight or ten feet of the laminated geyserite we found a curiosity which is well worthy of mention. This is a round hole six or eight inches in diameter, leading back from the lake into the bluff, further than we could reach with a nine-foot pole. It resembled the orifice of a drain pipe more than anything else, and for a few moments its origin and reason were very puzzling. A little examination, however, showed that it was the perfect cast of a tree trunk. The grain of the barkless stem could be seen and felt on the walls of the hole, and in one place there was a small side tunnel leading off from the main one, where a branch of the tree had put off. Long, long ago, when the top of the bluff was scarcely higher than the present lake level, a pine tree had fallen on the surface of the deposit, and, before it had decayed, had been covered up by the accumulation of geyserite. In time the wood had rotted away, and the waters of the lake, which in every storm are hurled against this shore with great violence, had washed away every particle of organic matter, leaving in the hard rock the perfect cast of the ancient forest tree.

At the head of the West Arm the fishing is much better than nearer the outlet, and enormous quantities of trout can be caught without difficulty either with fly or bait. Several of the men were very fond of fishing, and as they used stout spruce poles with strong lines and grasshopper bait, they readily caught all the fish that could be used. It was impossible, even if it had been desirable, with a nine-ounce rod to drag from the water these fine large fish, which averaged a pound or two in weight, and my catches never compared in numbers with those of the men, though I presume I derived as much satisfaction from the capture of my six or seven fish as they did from their fifteen or twenty. The water here was quite deep close to the shore, and it was therefore a very convenient place for casting.

The fish too were larger and seemed much healthier, stronger and more vigorous than those near our first camp on the lake. They took the fly with a rush, and made a fine struggle for their freedom. With one of them I had a curious experience. I had put on a new dropper, and as the gut was dry, and I feared somewhat brittle, I did not at once draw up the loop close to the leader, but left it somewhat loose, thinking that after it had become a little softened by the water, I would draw it tight. I had only made one or two casts when a pound trout took the dropper. He was a vigorous fish, and made an unusually strong resistance. When at length, nearly exhausted, he came to the surface of the water, his tail was the first part that showed. This was repeated several times, and I supposed that I had in some way fouled him. On landing him I found the dropper firmly fixed in his jaw, while the tail fly was fast in the skin of the back just behind the soft adipose dorsal fin. The dropper had slipped down to the end of the leader during the struggles of the fish, and then in some way the tail fly had become fixed in his back.

The evening before our departure from the lake an accident happened to Mr. Hague which came very near having a fatal termination. With a companion he was returning to the camp, and to avoid the fallen timber of the forest rode down to the lake shore, coming out on the beach two or three miles east of camp. The beach was in most places hard, and there was a trail along it, over which a dozen or fifteen horses had passed within a day or two. The two rode along very quietly until they came to a narrow bar, which separated the lake from a quiet lagoon just under the bank. Dandy, Mr. Hague's horse, was young and nervous, and becoming alarmed by the white waves that rippled up on the bar, insisted upon edging over to its shoreward side, and, getting too far in that direction, sank suddenly into a soft quicksand nearly up to his back. The rider at once relieved the animal of his weight by springing off him, and in a few seconds the horse had floundered off into the deep water, and was swimming across the lagoon toward the shore. Mr. Hague now found himself imprisoned in the clinging sands, which held him so firmly that all his efforts to free himself were fruitless. The horrible quicksands had closed about his legs with an unyielding grip and held them as in a vise, and he could move only the upper part of his body. All the time he was gradually sinking deeper and deeper into the sand. The water at first reaching only to his waist, crept slowly to his breast and then toward his shoulders. He called to his comrade to throw him a rope, by means of which he might free himself; but he, after having had a great deal of trouble with his mule, had finally lost her, and she was running for the shore as fast as she could go, so that the peril of the imprisoned man was not at once noticed nor understood. Meanwhile the water was rising, and now he could only keep his face above it by bending back his neck so that the back of his head was in the water. Little need be said of what passed through his mind. It is given to but few to know how a brave man feels when he looks his certain death squarely in the face and never flinches.

The man who finds himself in such a desperate strait as this is sometimes gifted with a strength far beyond that which he ordinarily possesses. The exigency of the occasion calls forth all the latent power within him; he becomes for the moment a giant, capable of efforts which under other circumstances would be impossible. So it was now. The energy born of the comprehension that this was his last opportunity gave him an unnatural strength, and a final desperate struggle freed one leg. The other yielded more readily, and a moment later Mr. Hague found himself swimming toward the bar, on which he soon found a secure resting place. It had been a narrow escape.

Returning to the shore as they had come, the two walked toward camp, finding the mule on the way. The horse had disappeared in the timber. The next day, except for a general lameness where he had wrenched himself in his efforts to get free, Mr. Hague found himself none the worse for his terrible experience.

The Military Target.—The change decided upon in the subdivisions of the target to be used by the soldiers of the regular army may be a good one if it is followed up by vigorous practice on the part of the men, with competent supervision by properly educated officers. It is a factor of no moment whatever in making good shots. A properly trained marksman does not need this or that form of target to make him such. The idea that men may be trained into good "line" shots while they may be neglectful of points of elevation is a very curious one. If the scheme is to give the soldiers something after the form of a man to shoot at, why not carry it out to its logical end and have the diagram of a human form, with a gradation of value in shots from heart to toe hits. A soldier must be taught to know his weapon thoroughly, and no legerdemain nor jugglery of scoring or target marking can make him a marksman when he is not such. There is a plausible explanation of this recent change in the suggestion which comes from some quarters that it is intended to make such a difference between the records of the army and outside scoring, that those unfortunate comparisons will not be cropping up every now and then in the papers, to the annoyance and humiliation of those who hide a great deal of ignorance behind a great deal of gold lace.

With Profound Regret we observe that the grave apprehensions so long entertained by a Western editor's friends are at length shown to have been well founded. The spectacle of an intellect broken loose from its moorings and drifting, we know not whither, is always most melancholy, and in the present instance it is doubly distressing because of its exposure to public gaze. Until those whose duty it is shall have provided for the unfortunate man's seclusion, we bespeak for him and for the wildest freaks of his unbalanced mind the most unstinted charity.

The Sportsman Tourist.

CAMP FLOTSAM.

XIV.—"THE WINTER OF OUR DISCONTENT."

THE few days which were left to Truthful James were busy ones indeed, and there was little leisure after his fishing. From early morning until nightfall the white mask haunted the lonely shores and dodged in and out of the coves bent on wringing all that could be had of sport out of the fast flitting August days. Once with his guide he made his way over into Fishing Lake, a considerable body of water a mile to the northward, to and from which the boat was dragged on a lumberman's sled. In this El Dorado he took seven or eight fair-sized bass, and shot a porcupine which he discovered in a tree on the shore. The rest of his time was devoted to the home waters. The bay, which had been the scene of the editor's triumphs, was fished daily and yielded good returns. Here we sat through the forenoons, entertaining each other between bites, and careless, meanwhile, of the ways and means of landing our fish, by which each once put his prized Mitchell rod in jeopardy. The warning to be more careful first came to us. We were fishing in quite a depth of water, and had reeled up a large fishing bass to within three or four feet of the tip, when suddenly it made a dash and went under the boat. So little attentive were we to the state of affairs that, before we thought of a counter movement or giving line, we felt and heard the upper part of the rod strike against the keel of the boat. The rod was literally wrapped about it, but stood the strain like a piece of whalebone. Before the day was over, Truthful James had the same experience. Another day at Cady's Bay with grand success and then one among the islands followed, and Truthful James had made the last cast of his vacation. Many were the projects for next summer bruited and discussed during these latter days. On one of them we encountered a resident from Rice Lake, fifty miles to the west, and were captivated with his tales of muscalonge and black bass. Other lakes within a radius of twenty miles were discussed, and it was finally determined that the tents should be stored and left in the Dominion in readiness for another campaign on Canadian waters.

Without a sigh or a word of regret the embodiment of abstract truth turned his back upon the camp, set his face borderward and we were alone. With the exception of Sabattis no keel save our own ploughed the lake or cruised among the islands and over the long stretch of waters. However indispensable good fellowship may be to a camp, there is a certain charm in the assurance that all the melody of nature in some far off nook, the gleam of sunlit waters, the leap of the fish, and the mellow haze upon the hills are for your eyes and ears alone. That the golden track of the moonbeams and the dark shadows of the darker pines across the water, the dusky radiance of island channels and the ghostly forms in the darkened coves fall only upon your vision, breed in your brain the fantasy that you are but a light or a shadow among all the rest. *Vanitas vanitatum;* no wonder that En Gaddi, Carmel and the desert had their hermits, nor would it be difficult to breed one here.

Our first day alone in camp began with a drizzle and rain. We awoke with its beating on the roof, but were content to lie and drowse half the forenoon away. At last we arose, put the camp stove in place and prepared breakfast in the tent. We had a day of loafing before us, but fortunately by the time the meal was over the Indian boys were on hand for a visit. They had long since parted with their taciturnity and a genuine attachment had sprung up between us. The elder, a young man, amused us with tales of his forest life in the Adirondack country, where he was born, and in Canada, and parted freely with his wood lore. He was honest and trustworthy and we could leave the camp without fear of having a single article disturbed during our absence. Among the regrets over our coming departure, the separation from our Indian friends was far from the least. On this occasion they brought us a chicken and a supply of green corn and we gave David a pocket lantern, a lot of bass flies and some leaders.

Shortly after noon the sun broke through the clouds, and David, taking his gun, went back into the woods on the island. During his absence an event occurred which was new in our experience. A great splashing was heard in the water below the tents, and on going out to learn the cause, we found Sabattis's dog standing up to his body in the water, and thrusting his head now and then beneath the surface and holding it there for two or three seconds. The younger of the Indians, who had remained in camp, at once said that the dog had been attacking a porcupine, and called him in. When the poor beast came to us he dropped at our feet and rolled on the ground in agony. His throat and muzzle up to his eyes were studded with quills as close together as the hair on his back, and we found that the inside of his mouth and his tongue were in the same condition. The boy said that he would have to be killed, but we insisted that David should first be called. This was done, and as soon as he arrived he caught and examined the dog. We had a pair of small pliers in our kit, and with these, while David held the dog upon the ground, with one of his jaws firmly grasped in each hand and his mouth forced wide open, the long and tedious operation of extracting the quills was begun. At the end of two hours it was dark and the work was not half through. The poor animal seemed to understand what was being done for him, and endured it with a steady moaning, varied occasionally by a sharp cry of pain and a fierce struggle as a quill more deeply fixed than the rest in his tongue was drawn out. As it grew dark the dog was brought up to the tents, and under the light from the lanterns the work was resumed. At last it was finished, and the patient, relieved from his affliction, stretched himself out exhausted. Strange as it may seem, this was his third encounter with a porcupine; usually the first experience of a dog with one of these animals is his last, and he avoids them ever after, but David assured us that his dog would attack another on sight.

The liability of a favorite dog to meet with such a misadventure made us anxious to learn a remedy less barbarous and bloody than the one applied. The Indians knew of none, but some days after the incident above mentioned, we obtained the following crude receipt from a backwoods hunter who assured us of its efficacy. To extract the quills by force, in his opinion rendered the dog worthless from that time forward. This was the remedy: As soon after the encounter as may be, while one holds the jaws of the dog wide apart, let another throw into his open mouth two double handsful of dry, cold wood ashes fresh from the fire. Then let about a pint of water be poured upon the ashes, and the animal allowed to go at large. The effect of the application will be to cause the quills to shrink and drop out instead of work-

ing in deeper, as they will do if left alone. Twenty-four hours, it is said, is sufficient to free the dog from the quills. The same application upon the inside, if the quills are fastened in the flesh, should be used.

On the day before breaking camp, Sabattis put in at the landing and proposed another visit to Cady's Bay and the bridge. As to the matter of fishing we were a little indifferent, but there was a certain pleasure in listening to the old man's talk, and we had not yet been out with him, so we took a place in the stern of his skiff, and under his lusty strokes were soon skirting the shore of Griffin Island. All sorts of vagaries and legends fell from his lips that day; reminiscences of Long Lake, the Raquette and the St. Regis, and trapping and hunting adventures were poured into our ears mingled with his own wild superstitions. On a small island he pointed out the spot where a pot of gold was buried and watched over by some infernal thing which sometimes showed itself at night in "the shape of a bag of flour hanging just above the ground;" then on a point he showed us the ruins of a cabin where a squaw was murdered by her lover, and told of the wraith that on moonlight nights had been seen about the place, and again more realistic, pointed out the hiding place where a counterfeiter, who had escaped from a prison in the States, took refuge, and from which he was taken by the detectives and hurried back to his cell.

There was more of entertainment in his conversation than in fishing, and we reached the bridge without having wet a line. As we passed under the low timbers on its southern end and emerged on the upper side we came upon the edge of a sort of quicksand and moss bed, which ran out a hundred feet from shore. The water was too shallow for the boat and we were soon aground. While trying to get off we discovered a colony of large green frogs, tremendous fellows, scattered about upon the moss but out of our reach, some fifteen or twenty feet away. Anxious for some saddles we tried to force our way through the sand and moss, but found it beyond our efforts. As we were about to give it up we happened to think of the flies. The first cast of a red ibis fell upon the moss within a foot of one, and there was an angry squeak from three or four as they each made a single jump toward it. The next cast landed the fly just at the nose of another; he made one snap and we had him. As we dragged him to the boat a second followed him half way, and this one we took with the next cast. We took in every frog within twenty-five feet, and on counting up found we had sixteen saddles. The last frog refused the bait when dropped before him, and gazed in astonishment at the rapid passage which his neighbors had made to the boat. Finally we dropped the fly just behind him, and with a quick strike hooked him in the leg. For a minute or two he was as lively as a bass, but soon came in and contributed his saddle with the others. It was something new in the way of frogging to Sabattis, and he enjoyed the sport immensely.

Then on his old fishing ground we had our last bout with the bass for the season. In a couple of hours we had a fine lot of twenty or more small-mouths, and then, while Sabattis was raising anchor and getting under way, we took off the hook and leader, reeled in the line and unjointed the rod. That act was symbolic of the fact that our outing was over, that we would no more cruise along those shores, or dream day dreams among haunted islands, clustering with memories too young to be romantic, yet memories to whose charm naught would be added did they come down from the days of Frontenac, Jacques Cartier, or a thousand years before. It was a symbol, too, as significant as was ever foreshadowed in orgy or mystery, by brazen serpents lifted by prophet hands or rent veils of temples, that an old dispensation had passed away and a new had come, a symbol like that of the lost Persephonê, that days of toil, of darkness and of winter must be lived before we could again greet our mother with outstretched arms and bask once more in the smiles of her summer. We almost envied the swarthy Sabattis, to whom, with all his poverty, life was a holiday, lived with no thought of the morrow, among the rocks and trees and flowers, the song of birds, and by waters where the deer roams and men seldom come. All these we were to leave, while he would remain. Unfretted by care, he would drift among the islands, live his half indolent life and win a sustenance; what more would we? We would depart, burdened with aspirations and laden with mighty grains of sand, which "waste the heart and wear the body," and he, with none of these, would be moving on in the most absolute equality with us toward the same *hic jacet*. And he was content. Could we say as much?

With face to the stern, we sat looking backward, watching the scenes of our summer glory as they went gliding by. Swiftly the headland on our left drifted out and shut off the bay, the Two Brothers soon hid the headland, and then themselves sailed around a point to be seen no more. The expanse of waters behind us grew longer, and island after island passed by and became indistinguishable from each other against the further shore. We watched the green monument by the grave of Griffin until it faded against the background of forest, and then with a sigh for a farewell turned to face the camp, which was now in sight on the larboard. What a picture it was; the two tents on the bluff overhung with pines, with a background on which already the frost had begun to trace faint characters in red and gold. The smoke was lazily floating over the treetops, and between the tents we could see the blaze of the fire, now dim in the glare of the afternoon sun, which was that night to burn its farewell.

The next morning by 10 o'clock the tents had disappeared from the slope and were in barrels at the landing. The tables alone remained to mark the site of the camp. From the staff our flag was still floating, and at its foot a disconsolate chicken—the last of the flock—was tied, awaiting its final hour. At high noon the flag was lowered, the island evacuated, and we made for Battersea, where we passed the night at Van Alstyne's and the Queen's Own, and were once more beneath the roofs of men.

And now we bring the long record of our long outing to a close. If we have written aught that may be useful to the camper, if we have contributed a mite to the lore of the outer, if there be that in our journal which has helped a brother to live over again, in memory, his forest life or brought to one who is deprived of all this, a glimpse of its glories, we are more than repaid. For our work has been a labor of love and a task not altogether unselfish. Through winter days we have lived over a life thronged with visions of rock-bound waters, forest-girdled lakes, golden sunsets, and a wilderness wampum dyed with the frosts of early autumn. While the sleet was rattling against the windows we have cast through fragrant mornings and drowsed under the weather-stained canvas through summer noon days. In winter nights, while gathering our flotsam, we have heard the cry of the loon from far off Loughborough and sat again in the radiance of the camp-fire with companions of the summer and the race of Sabattis gathered around.

Where our next camp-fire shall gleam or who will throng about it we know not. Long ago we suggested to FOREST AND STREAM the project of a camp made up from its staff of contributors. But their wide dispersion seemed to its chief an obstacle which would be found unsurmountable. We dissented and still believe that half a dozen at least can be mustered at some point on the St. Lawrence, Delaware or Susquehanna, or on the Muskoka Lakes, or in Michigan. It is worth the attempt, who indorses the suggestion? If no one, then from the staff aforesaid, we will beat up a single recruit or two and build our camp where we can pass a royal summer with our rods.

On the morning of the 2d of September, from a hilltop three miles away, we bade farewell to Loughborough, and at dusk on the same day we stepped ashore at Alexandria Bay and our feet were on the land of the Mugwump.

WAWAYANDA.

THE WORLD'S EXPOSITION.

FROM A SPORTSMAN'S STANDPOINT.

Editor Forest and Stream:

Amid the splendid displays of vegetable and mineral productions, and the triumphs of American science and art, to be seen at New Orleans, which so eloquently speak of the grandeur and wonderful wealth of America, none were more attractive to me than the magnificent collections of her living and fossil fauna there exhibited. At no other time nor place in this country probably, has there been such a number and variety of beautifully stuffed specimens of birds and animals to be seen; many so handsomely and skillfully mounted, and poised so naturally and gracefully, that one never tires of looking and admiring.

Idaho has a splendid collection, embracing the heads and necks of the larger animals, such as the several kinds of deer, bear, buffalo, elk, moose and mountain sheep; and the entire skins of the smaller animals, such as foxes, wolves, rabbits, beaver, lynxes, etc. Among her birds are eagles, hawks, grouse, sage hens, ducks, etc. Among the curiosities here seen is a deer's horn which is embedded in a tree. It had caught and been broken off in a crotch of a tree, and the wood had grown over it. Another still greater curiosity is the head and horns of a mountain sheep imbedded in a pine tree, completely encased in the wood up to the roots of the horns, the forehead merely visible, and found thus imprisoned in the tree eighteen feet from the ground. Still another is the antlers of a deer with a horny excrescence a foot long, pending from the right antler.

From Washington Territory there are specimens of the panther, elk, mountain sheep, etc.

Montana makes a handsome display of deer, elk, antelope, moose, mountain sheep, buffalo, beaver, etc., as does Wyoming; and the latter exhibits a fine collection of birds, and Indian curiosities in the way of clothing, skins, ornaments, etc. The contribution of birds and animals from the Yellowstone Park is peculiarly attractive, and adds zest to the universally expressed hope that FOREST AND STREAM and Senator Vest may succeed in preserving the Park for the nation's benefit.

In the Dakota department is a beautiful grassy circle, in the center of which is a mountain pony, bridled and saddled, and appropriately arranged around among the trees and rocks are antelope, black-tail deer, mountain sheep, elk, wolves, rabbits, a large grizzly bear, a panther and a large white buffalo. Also eagles, hawks and other birds, and three live Sioux Indians, a man, a squaw and a girl. This Territory exhibits in a room near by, an Indian wigwam, and everything usually found therein, and on the roof of a model house is an enormous snowy owl. In another room are beautiful specimens of skins, and the heads and necks of the larger animals, and the entire forms of many of the smaller animals. It is difficult to communicate the beauty and value of this collection. Overhead is a canopy of dressed robes, on each side are mounted specimens, and the floor is carpeted with dressed skins and Indian relics. On the right a large black eagle with outspread wings and a horned owl, are most conspicious; and on the left an immense bear is the central figure.

Minnesota's display is exceedingly attractive. The lynx, beaver, raccoon, badger, mink, otter, marten and other fur-bearing animals, are exhibited and arranged with excellent judgment; and here is to be seen one of the very best collections of water fowls. On the left is a case filled with specimens of her other native birds, embracing several splendid bald and black eagles, etc; and the pyramid of her agricultural products is surmounted by a beautiful and life-like white deer. Just over the way is a lovely miniature of the Minnehaha Falls, and near it are birch bark canoes, and other implements of Indian navigation.

The display of stuffed animals and birds in the Government department is very fine, but it is inferior to many others; so much so, in fact, as to excite comment. Nevertheless, its elk, moose, buffalo, deer, bears, mountain goat and mountain sheep, etc., are splendid.

Texas makes a most creditable display in every respect. When it is remembered that Texas possesses rich lands and a salubrious climate; that she is larger than Great Britain and Ireland, or the Austrian or German Empires, or France, some idea is gained of her immense capabilities. Her citizens have taken pride in exhibiting her wealth. The display of animals, birds and reptiles from the collection of one gentleman alone, living in San Antonio, and of insects from the collection of a gentleman residing in Bastrop, is magnificent. She also displays a splendid collection of eggs, and the largest ox and mountain sheep horns. Many cases are filled with curious Indian relics found in this State.

Arkansas, amid her grand display of mineral, agricultural and vegetable wealth, exhibits a fine collection of her birds prettily arranged in two compartments, one surmounted by a swan, and the other by an opossum of extraordinary size; and near by are huge specimens of potatoes, suggestive of the palatable dish which caused Senator Garland to ride the fence on the question of the superiority of "possum hot" over "possum cold."

In the Mississippi department, which in many respects is an astonishing indication of her wealth and prosperity, are a white raccoon and a white squirrel. Her display of birds, congregated around the deathbed of Cock Robin, is one of the most exquisitely beautiful displays in design, execution and effect that I have ever seen. Around it invariably lingered all the children who saw it.

Guatemala makes a beautiful display of birds, and among the handsomest is a male and female quetzal, the trogan, etc.

In the Mexican exhibit are many fine specimens of animals and birds, stuffed and mounted, and tastefully grouped in pairs on twigs and boughs. Among them the wild turkey of Mexico, strikingly different from our own, and said to be the progenitor of our domestic turkey.

Maryland, in proportion to her size, makes the most creditable display of birds, animals and fish, the latter preserved in alcohol. Her collection of birds alone embraces about six hundred specimens.

In the Mexican department is an exquisite picture of a male and female bird of brilliant plumage, sitting upon the fallen trunk of a tree, with a lovely forest background. At a little distance it appears to be a painting, but close inspection shows that it is made entirely of small bits of different colored feathers, varying in size as in hue, and betokening marvelous taste and skill, and patient painstaking.

Ward's Natural Science Establishment, of Rochester, contributes its choicest treasures. Its fossil remains are said to be the finest in the country. Here we see the largest specimens of the moose, from Nova Scotia, the caribou, and other animals of North America, the largest gorillas, ourang-outangs, and other tropical animals; the walrus, sea-lious, otter, and other arctic animals; and birds, reptiles and fishes. There is the skeleton of a whale fifty-two feet long, and a representation of the large mammoth, the skeleton of which is in the Royal Museum at Stuttgart. Some conception of the size of the mammoth may be gathered from the skeleton of a large elephant standing in close proximity, which looks as a dwarf beside a giant. Here is to be seen the fossil remains of the Irish elk, as well as remains of other extinct animals; and also handsome specimens of existing birds and beasts from every quarter of the globe, as well as fish and reptiles.

And last, though by no means the least, is the display made by the Society of American Taxidermists. In beauty of execution and artistic design these excel. Notably is the wild turkey, male and female, of the United States, and our noblest bird, and peculiar to our own country. Like Dr. Franklin, as our national bird, I like it far more than the eagle.

Among the most attractive features of their display are the following: "Coming to the point." A beautiful white setter, with liver-colored patches, suddenly points. His motions are arrested just as he has raised his right front foot. Concealed from him by a small patch of bushes and grass is a bevy of partridges (Bob White partridges, which some people belittle by calling quail) in the various attitudes they invariably assume when startled by the near approach of an enemy. It is beautiful beyond description; and I could not forbear asking myself whether it was possible that this beautiful dog had been killed, in order to contribute his part to the lovely picture.

Another touching picture is "The wounded heron." Behind glass, transfixed by an arrow, which has penetrated its vitals, and tinged its snowy plumage with the red life-blood, is a beautiful white heron. It falls with its back downward, its bill is open as a cry of anguish escapes its breast, and one foot clamps the cruel arrow as if in a vain endeavor to draw it from the quivering flesh. It was mounted by Mr. F. S. Webster, Washington, D. C.

Another, scarcely less beautiful, but far less painful, is a snow-white heron, standing on one foot, with the other drawn up under its feathers. It might be aptly styled "meditation."

Another charming group is a prairie hen and her young brood. But the little innocents excite your compassion.

"Does your mother know you are out?" is a pleasing picture. A young alligator has just emerged from the egg shell, on the banks of one of the lovely streams or lakes of Florida; and a scarlet ibis is stretching forward its neck in the act of gobbling him up.

Still another is "A wintry day." The leafless trees, snow-covered earth and somber sky betoken winter; and a group of six beautiful snow buntings are in flight.

While all this is so beautiful, in looking on one can scarcely forbear the feeling of pity for the innocent and beautiful creatures, to whom the pleasure of existence is doubtless as great as that in men, whose lives have been cruelly taken that their skins may form a pretty picture. The words of Burns on seeing a wounded hare came to my mind:

> "Inhuman man; curse on thy barb'rous art,
> And blasted be thy murder-aiming eye;
> May never pity soothe thee with a sigh,
> Nor ever pleasure glad thy cruel heart."

I do not propose, however, to be more humane than my brother sportsmen; but I endeavor to follow old "Nessmuk's" noble example, and never wantonly destroy life.

There are also to be seen beautiful specimens of the inhabitants of our rivers, lakes and seas, from the red snapper of the South to the largest salmon from Columbia River; trout from the cold streams of the Rockies, and tarpon from the inlets of Florida. All who can should visit the exposition. It tends to unify the country. It inspires in the breasts of ardent Confederates pride in and love for the Union as it is. It removes from the minds of Northerners prejudices against the South. It kindles afresh in the hearts of all fraternal feelings and sentiments of patriotism.

A. K. L.

VIRGINIA.

MASSACHUSETTS FISH AND GAME PROTECTIVE ASSOCIATION.—Boston, Feb. 14.—One of the most pleasant and well attended meetings the Massachusetts Fish and Game Protective Association has held for a long time occurred last Friday night, at the Parker House, President E. A. Samuels presiding. After some discussion in regard to the game bill to be presented to the Legislature, the proposal for membership of the names of a number of gentlemen and other routine business, the president introduced Mr. Edw. E Small, who addressed the association upon the subject of the "Mackerel Fishery." The gentleman gave a very entertaining lecture, describing the habits, migrations, and causes of the migrations of the mackerel, and the various methods of capturing them from the infancy of the fishing industry of the country up to the present time, and in closing offered the following resolutions, which were adopted by the association: *Whereas*, The fishing industry of the United States has been brought to the verge of bankruptcy and ruin by the "treaty of Washington;" *Resolved*, That in the opinion of the members of this association that treaty should not be renewed; *Resolved*, That a duty of one cent per pound should be put upon all fish coming from any foreign country; and lastly, *Resolved*, That a copy of these resolutions be sent to our Senators and representatives in Congress. Later in the evening the Hon. Chas. L. Woodbury spoke upon the subject of "The Condition of our Fishermen on the Abrogation of the Existing English-American Treaty."—BOSTON.

Natural History.

THE SONG OF THE WHITE-THROATED SPARROW.

DR. M. L. LEACH.

IN some of the newer parts of Michigan, the song of the white-throated sparrow (*Zonotrichia albicollis* Bonap.) is interpreted as a prayer to St. Theresa. It is heard sometimes in the natural groves bordering the outskirts of the newer villages, but generally only in the wilder and more desolate depths of the forest. The notes are inimitably clear, sweet and plaintive, and it requires only a moderate play of the imagination to convert the song into the petition, "O, hear me, Theresa, Theresa, Theresa!" It is not easy to express bird songs by musical notation. In this case we may approximate success by using the flute stop of a cabinet organ, giving in the first three measures one whole note each on C, G and E of the second octave of the treble clef, following lightly by three measures in E, each consisting of three-quarter notes and a quarter rest, as follows:

The first three measures correspond to the words, "O, hear me," and the last three to the name of the saint, "Theresa," three times pronounced, with the accent on the first syllable.

The arrangement of musical sounds indicated above, appears to constitute the most perfect and complete form of the song; but it is varied in different localities and by different performers, as if among birds of the same species there were different degrees of musical talent and different fashions in musical education. In one place, where I had excellent opportunities to listen, the trill of the last three measures was seldom heard, each measure consisting of a whole note. In another locality, not many miles away, the trill was the rule, with scarcely an exception. Sometimes one or another of the first three notes is omitted, sometimes "Theresa" is pronounced only once or twice, and sometimes, though rarely, the trilling is continued through more than three measures. The song is sometimes heard in the night.

I suspect this interesting bird is an accomplished ventriloquist. On one occasion I listened for some time to what seemed to be two birds, in different directions and not far off, but hidden from view. The C note was omitted. One would sing two notes in G, which would be followed in perfect time by two in E by the other bird. I was strongly impressed at the time with the idea that there was only one singer present, and that the song, beautiful beyond description, was a skillful display of ventriloquism:

Deep in the gloom of the wild wood,
List to a sorrowful plaint—
A penitent sparrow's petition,
Addressed to the beautiful saint.

"Hear me, O Theresa, Theresa!"
Sweetly, in silver-toned notes,
Sad as the wail of a lost soul,
The prayer on the atmosphere floats.

Why from the gentle saints presence
Has the sweet bird been banished so long?
Or why in the gloom of the wild wood
Must he warble such sorrowful song?

Deep in the gloom of the wild wood,
List to the sorrowful plaint,
And take him again to thy favor—
The sweet bird—O beautiful saint.

TRAVERSE CITY, Mich.

THE BIRDS OF MICHIGAN.

BY DR. MORRIS GIBBS.

(*Continued.*)

10. *Sialia sialis* (Linn.) Haldem.—Eastern bluebid, red-breasted bluebird.

The first arrivals usually appear in the State from Feb. 15 to 20. The earliest note of arrival in my books is (Kalamazoo county) Feb. 8. Birds have occasionally been observed in January in the State, and as specimens are often seen in December, it may prove that the bluebird is sometimes with us throughout the winter months in mild seasons. In some severe winters they do not arrive until March, and the little fellows are rarely common before March 10. I have seen them very abundant by the 20th of the month in Montcalm county. The birds evidently migrate slowly, and are certainly more abundant during the height of the migrating season, proving that a portion of them are certainly only transients and are passing through to the north.

The preparations for nesting rarely begin before April 12. In advanced seasons a few nests can be found containing eggs by April 15. I have met with eggs only one season at an early date. On April 18, 1878, I found several nests with complete sets of eggs, but it was an unusually early season. The height of the nesting season may be placed at May 20. We may deem such late preparations the result of tardy mating, some young male having had a difficult time in securing a mate. In all communities of birds there are some individuals, more commonly males, which have failed to secure partners for the season.

Frequently a male of this species, as in the case of many species, after being apparently assured of success as an appreciated swain, is routed by another of brighter blue and redder breast. With birds generally the mating occurs, to all appearances, every season. Many species of hawks and other large birds are constant to one mate, and the union is continued till the death of one of the pair; but by the smaller birds new mates are frequently chosen, and some species are proverbially polygamous. In the case of bluebirds the same demonstrations may occur each year during mating season, between well-mated birds which have been consorting for years, that are seen in cases where birds are mated for the first time. I have repeatedly observed the endearments of a pair of robins, which to my knowledge had been mated for several years, the attachment growing stronger apparently each year.

The mating season with the bluebird begins soon after their arrival in any numbers, and generally lasts until April 20 to May 1, during which period the little fellows are in a nervous state often bordering on frenzy. The battles between the males are generally tame affairs, and although occasionally quite s severe contest occurs on the top of a dead stub, or even in the air, as a rule little ill-feeling appears to exist. One can often witness a pursuit in which both pursued and pursuer are warbling forth the delightful notes so familiar to persons acquainted with this sweet songster's melody.

The site chosen for a nest is variable, the birds in their selection of a suitable spot being largely influenced by surroundings. The situation usually preferred is a cavity in a dead stub or tree, in a knot hole in the body or limb. The excavations by woodpeckers are frequently occupied. Bird houses in dooryards are also used, and even the spaces in the cornices of buildings are taken possession of. Since the invasion of the English sparrow, many battles have occured regarding the occupancy of some favored site formerly under bluebird rule, and it must be told, with ill-favor toward the interloper, that in pugnacity and strategy the sparrow is the superior.

The nest, a rude, illy-constructed affair, composed of grass, occasionally a few small twigs, roots and a few a feathers, is placed loosely in the cavity selected, and contains four or five light-blue eggs. The number of eggs is occasionally six, but more than five eggs is an uncommon occurrence. In an article that recently appeared, collectors mentioned the finding of seven and eight eggs in sets. The cowbunting frequently selects the nest of this species in which to deposit her eggs, and I once found a nest containing five eggs of the rightful owner and three spotted alien eggs. Such a set when hatched would make a nest full of young.

An addled egg is often found in a nest of young, and in one cavity I found three more or less complete sets, in all twelve eggs. Such an occurrence can only be accounted for in one way; the cavity was first occupied by a pair of birds, which were driven out after the eggs were deposited, or perhaps the birds were frightened or destroyed. A new set of eggs was then laid by pair number two in a new nest built over the first, and a second time the eggs were left by the parents. Let us hope that the first pair rallied and again took possession of the cavity. The hole in question contained three nests, occupying a space from the bottom upward of eight inches. The lower set of four had lain cold and deserted at least a month; the second set was all of two weeks old, while the upper set was being incubated at the time. A few instances have met my observation where the rightful owners of a nest had attempted a riddance from the cowbird's eggs by building a new nest over the polygamist's eggs, and had even sacrificed their own eggs, two in number, in one instance.

Average length	6.58	Wing	3 12	Extent	10.11
Greatest length	6.80	"	3.61	"	11.43
Shortest specimen length	6 36	"	2.64	"	8.80

11. *Sialia artica* Swains.—Arctic bluebird, Rocky Mountain bluebird.

A single authority embraces this species in the State, a list of birds of the Upper Peninsula, by Dr. S. Kneeland, Jr., entitled "On the Birds of Keweenaw Point, Lake Superior." The list embraces 147 species, and was published by the Natural History Society of Boston in their proceedings 1857.

The bluebirds known to me are very advantageous to the agriculturist, and from April to September are eminently beneficial in our State. The food consists principally of grasshoppers, spiders and larvæ during the summer months. In point of merit the bluebird ranks higher than the thrasher. Fruit is only occasionally eaten as a relish by our familiar friend.

12. *Polioptila cærulea* (Linn.) Scl.—Blue-gray gnatcatcher.

This dainty, airy, woodland bird arrives in the latter part of April as a rule, but occasionally not till May day has passed. The earliest arrival recorded in my experience is April 18.

Soon after arriving the pairing season begins, and from May 10 to 20 the restless, active creatures are constantly on the move from daylight to dark. The species is pre-eminently active from the time of its arrival to its departure in September, but during the few weeks occupied in mating and nest building it is even more on the move. Incessantly skipping from branch to branch, spreading its tail or flirting it from side to side, up and down, dashing into the air with the impetuosity of a hawk, wheeling and returning to its perch, where the tiny insect disappears with a snap of its captor's bill. Now chivalrously flying about its mate or pursuing some imprudent bird that has ventured on its domain; again twittering and chattering along a delicate twig, in evident attempts to attract its inamorata's attention.

During all these varied movements our sprightly friend has been as noisy as it is possible for so small a creature to be, and though there is no evidence of a regular song, the sprightly notes are nevertheless very pleasing. The song, if it can be called one, is a feeble effort; only a few chirping notes issuing from its delicate throat. The call notes are few and resemble the song.

The nest, generally completed by May 25, is a very artistic affair, and excels in beauty and neatness of construction all other nests of Michigan birds, not excepting the humming birds. Formed in its framework of various fibrous materials and lined internally with soft substances, it at once suggests quite a substantial structure, as well as an inviting habitation. Its elegance, however, consists in its grace of form and external lining, and though the interior is perfect, the finish of the outside is really a marvelous piece of work. The size of the nest is in accordance with that of the bird, but appears much too deep. The structure, situated on a limb from two to ten inches in diameter and looking like a lichen-covered knot, is about two inches high externally, one and a half inches deep inside, nearly two inches across the top, while the cup is but little over one inch and a quarter across at its orifice. Many nests that I have examined were smaller than the one described and many are also larger. Some nests are quite shallow, and again one is found very high in proportion to the size.

The bird while on the nest—or, as we may say, literally, in this instance, in the nest—sinks so deep into the cup that only a bill and the end of a tail are to be seen projecting above the brim. Some birds, in fact, are so completely hidden that they cannot possibly be distinguished from the ground.

The outside of the nest, with us, is covered with small pieces of lichens, mostly greenish, but some of a brown and yellow color are also used, the whole exterior presenting a very pleasing appearance. So far as I know, the only Michigan birds besides the gnatcatcher which cover their nests with lichens are the hummer and yellow-throated vireo. The lichens are attached to the framework of the nest, in the case of the gnatcatcher, by spider's webs and the silken fibers from the common milk weed pod *asclepias*. The saliva of the bird, perhaps of a glutinous nature, may be used, but to this I cannot attest. The framework of the nest is, although of delicate materials, quite durable in its makeup, and the fragments of lichens are detached only by the use of some force, so carefully are the ragged edges of the little pieces interwoven with the fibers composing the body of the structure.

I once discovered a nest nearly completed on May 12, which is an unusually early date. Eggs are rarely found in the nest of our little ashy blue friend before May 20. In complete sets they are most abundant from May 25 to June 10. I am quite well satisfied that only one brood is reared in a season, and consider those cases where eggs are taken in July, as instances of tardy nesting, or, perhaps, the first set of eggs had been destroyed by some small mammal, or even by an urchin, although a nest would rarely be found by a school boy and could be taken by no tyro in climbing. The red squirrel is a predatory scamp and does much damage to birds' nests. Few nests of this bird are found by collectors, unless the old birds are watched while building or feeding the young. The nest, placed as it is on the upper side of a limb, and much resembling a knot or excrescence, is very difficult of discovery even when the tree in which it is built is known.

The nests are more common in woods composed of the white oak, *Quercus alba*, in fact, I have met with only one instance in which a nest has been discovered in any other species of tree. The nest alluded to was found in a hickory, but in an oak woods. The birds are often heard in timbered lands, and the nests are undoubtedly built there, but are so high up that they are not easily found. The nests in oak trees are generally placed on nearly horizontal limbs, of a size not exceeding four inches, and are frequently quite fifteen feet from the body of the tree. Nests situated on small limbs, and quite forty feet from the ground, are not easily secured, and the devices of enthusiastic collectors often go for naught.

The usual method for securing the eggs from a nest placed on a small limb is to go out to it from a larger limb above, trusting to the weight of the body to bend the upper limb down so that the eggs may be reached. The return journey is more difficult; the nest having been torn from the limb, and the eggs placed in the mouth, the work of reaching the trunk of the tree is the next most important point in this hazardous undertaking. The limb has bent with your weight, and you must go up hand over hand to the trunk before considering yourself safe. Provided the set of eggs is secured complete, such an adventure is not looked on with dread by an enthusiastic collector, and the pretty brown-spotted eggs are generally considered as good pay for all trouble incurred.

The nests are usually placed from twenty to twenty-five feet from the ground.

The blue-gray gnatcatcher is rather restricted in its northern range, and is only common south of latitude 43° north. During four years' observations in Montcalm county, I failed to note its occurrence, while only thirty miles to the south it is comparatively common. Kneeland fails to record it in the Northern Peninsula. I have never seen it north of 44° north latitude.

Game Bag and Gun.

NEW ENGLAND GAME INTERESTS.

AS previously suggested, the chances are that the attempt to open September for the shooting of moose, caribou and deer in Maine will blow over. At a well-attended legislative hearing before the Committee on Fisheries and Game, at Augusta last week, a large number of petitioners were represented—over 400 from one section, including Phillips and Rangeley. Capt. Fred C. Barker, of Camp Bemis and Mooselucmaguntic steamboat fame, and one of the hotel keepers at Phillips, led in the argument for the petitioners. They attempted to prove to the committee the value of the deer in the Maine woods to the guides and hotel keepers, representing that with September an open month each deer would be worth from $75 to $100, whereas now they are of no value. The people of Maine cannot hunt deer in October, November and December, the weather being too cold. One of the gentlemen argued, however, that September might be opened without harm to the deer, since the foliage is then so thick that nobody could ever catch them; but he did not say how long he thought visiting sportsmen could be fooled into paying from $75 to $100 for the privilege of trying.

The arguments for the petitioners were ably answered by Dr. Hunter, of Machias, one of the most sensible and earnest friends of game protection in the country, followed by ex-Governor Selden Connor, himself a renowned deer hunter—in open season—although a cripple from wounds received in the service of his country. Their arguments were strong and to the point, and at the close the petitioners were given "leave to withdraw." This effectually settles the question for two years more, unless the friends of open September try the desperate chances of a minority report, or can present their measure in some new form.

But the war is not ended in Boston. In fact, the worst enemies of game protection are pretty thoroughly fortified just now. Notice was promulgated, the other day, of a hearing on the game question before the Committee on Agriculture of the Massachusetts Legislature, on Tuesday of this week. Immediately the game dealers took alarm, and a meeting of the Produce Exchange was called to take action. The term Produce Exchange is high-sounding, when not more than twenty game dealers are interested. But they are wealthy and influential, and the whole Produce Exchange Association, including over 500 members, many of them good friends of game protection, allows its name and influence to go with the game dealers—either by default or neglect. These game dealers have coined money by buying for almost nothing and selling for high prices, game when out of season and unlawful in other States, hence their extreme sensitiveness whenever the term game protection happens to be broached before the Massachusetts Legislature.

A good deal of bitterness cropped out, as it usually does, at the Produce Exchange meeting on Saturday, though the meeting was composed almost entirely of game dealers and those interested in refrigerators. The proposed legislative hearing was styled "The Annual Onslaught," and some bitter talk was made. A committee of ten was appointed to attend the hearing and oppose any legislation which should look toward hindering Boston from being the plague-spot which will work the extinction of the game birds and animals over a wide district of the United States, provided this Produce Exchange committee can have its way and full sway a few years longer. But, thanks to the Fish and Game

Protective Association and their labors, public opinion is growing, and the day is not far off when the people of Massachusetts will decide whether they will permit the utter extinction of grouse and quail and moose, deer and caribou in New England and the West, just to please the pockets of a score of the members of the Boston Produce Exchange.

It is stated that the chairman of the committee of ten, after the meeting, said that "the produce dealers of Boston do not object to any wholesome legislation which shall protect our own game, and we will welcome any perfecting of present statutes which will render them efficient, but the attempt to prevent the game dealers of Boston from selling grouse, quail, etc., after Jan. 1 is uncalled for and wrong. It is opposed to the interests of the people, and such legislation ought to be opposed. We do not need to go into the business of protecting Western game here in Boston. Under the present law we can sell grouse and quail until May 1, and that is well enough. Here in Boston is an association of wealthy gentlemen of leisure who want the game protected until they get ready to shoot it. We favor all reasonable protection of our own game, but at great cost these refrigerators have been constructed for the preservation of foreign game, and we do not feel it to be just that restrictive legislation should be continually threatened when no good is to come from it."

The gentleman showed his hand better than he meant, even if he did make some misstatements. Boston is not obliged to protect Western game, it is true, but "the interests of the people" are broader than the profits of twenty marketmen and the stock in half a dozen refrigerators, which were never built for storing game, but butter, cheese and poultry. The thrust at the Fish and Game Protective Association was as uncalled for as it was untrue. Its members are not gentlemen of leisure in any sense of the word, but earnest, hardworking merchants and tradesmen. Many of them are members of the Produce Exchange and have their places of business in the Boston markets. They do very little shooting themselves. "We favor all reasonable protection of our game." Alas! *our* game is about done for in this world. As for "all reasonable protection," if these marketmen are to decide upon reasonableness or unreasonableness, God pity the little game there is left in other States!

One of these very game dealers has frequently boasted that he knew every statute for the protection of either fish or game in any State of the Union to be unconstitutional, and, if he had the time, he could easily raise the money, and could break down any one of these laws, and catch, shoot, buy or sell either fish or game anywhere in the country as he pleased. The remedy for such boasters is a quiet dose of the will of the public, which is gravitating very fast toward saving a wholesome seed at least, of our game birds and animals from the grip of the avaricious marketman. The reasons why this committee does not object to, and so magnanimously would "help to support our present game laws," is that they actually do permit the produce dealer to buy and sell game just as he pleases, after a few months of hot weather protection are over. BOSTON.

NORTH CAROLINA BATTERIES.

A MOVEMENT has been inaugurated to repeal that law of North Carolina which forbids non-residents of the State or county to shoot out of batteries. The change originates with and is advocated by Mr. A. J. Forbes, of Jarvisburgh, N. C. This gentleman's idea is that non-residents of the State should be allowed the same privileges of shooting on the water as are enjoyed by residents. Mr. Forbes is reported to have spoken as follows:

"The fact is that most of the ducking shores of North Carolina are now owned by shooting organizations composed by Northern gentlemen. These club men visit us every season. They pay taxes to the State on the property they own, which, with the money they spend while there, amounts to about $40,000 a year. I believe these gentlemen should have the same privileges accorded to them as if they were residents. The residents for the most part are a very poor class of men, few of whom ever paid a dollar tax in their lives. I also would like to see other non-resident sportsmen than the club men have the same privileges accorded to them. At present the law permits the non-residents to shoot only from the shores of the Sound, while the resident can anchor his battery anywhere or stick his bush-blind in any locality he pleases. This is all wrong and extremely aggravating to the gentleman sportsman, who, after he has set out his decoys and made his blind on the bank, sees some selfish resident market-gunner come along and put out his rig right in front the club member and deprive him of all the shooting. I shall try my best to have the old law repealed, my sympathy being with non-resident gunners, whether they are shooting club men or not."

The market-gunners of the North are, as might be expected, very much interested in the proposal to throw open the waters of Currituck Sound, and do not hesitate to say that they are ready and willing to contribute money to help to pass any such bill. One of them recently said: "The fowl are gunned so much here in Great South Bay, that there is no money in shooting for the market any more. I want to get among them down in Currituck Sound, and we will make it warm for the ducks, the natives and the club men. What do we care for the club men and the natives. What we want is the ducks, and you bet we'll have 'em, too, if this law is changed." Another old South Bay gunner, who visits Currituck every winter in his sloop, said: "I hope the bill will pass. No gunner on the shore can compete with the men in the battery. Give me a battery and I'll spoil any shore gunner's shooting. The club men are a lot of stuck up dudes, and I am glad to break them up every time. The law, of course, won't let me use a battery, but that is no reason why a resident cannot hire one to shoot for him. In that way we beat the law every year. But this costs money and I want to see the shooting free for every one. There is a lot of money in killing fowl for the market, and if the 'Down Easters' can only get an even chance with the Carolina gunners we can give them points and beat them at their own game. I'll chip in handsomely to see the non-resident law repealed."

A prominent individual, interested in the sale of game, who requested that his name should not be used, said, when applied to for his views on this subject, "Yes, I have heard of the bill, and for the sake of the business I hope it may pass. As things are now, canvasbacks cost, when purchased from the native gunners, from $1 to $2 a pair; then they have to pass through three or four hands, which adds to the cost, with the freight, a dollar or more. I buy several thousand pairs in a season, and by rigging up a boat and sending down four or five shooters, I can get them much cheaper than by buying them. Perhaps the first year the birds will cost me as much as they do now, because the boat and the batteries will have to come out of the profits, but the next year these will have been paid for, and instead of my canvasbacks costing me $2.50 or $3 a pair they will cost less than a dollar. Gunners can be hired pretty cheap, and ammunition and provisions won't come to very much. It will be a good thing for my business. What effect will it have on the supply of fowl? Oh, well, for a while it will make them plenty in market, but they will soon get scarce again, as they are now. We need something to make the business better than it has been lately. Game is not as plenty as it used to be, and profits are not as large."

The effect of the proposed change will of course be to ruin the business of the residents of the seaboard counties of North Carolina, who depend on gunning for a living during the winter. No doubt the movement will be bitterly opposed by the residents of the State, and if it is passed, it will only be by the liberal use of money by the Northern marketmen and gunners.

DEER IN THE ADIRONDACKS.

THE Curtis bill is the bill to pass. It provides that deer shall not be hounded at any season. The text of the bill is given in our editorial columns. The petitions must be sent in to us at once, or they cannot be used.

Editor Forest and Stream:

When in your edition of October 2, 1884, I opened the discussion of game law violations in the Adirondacks, which has since taken so wide and interesting a range in your columns, Commissioner R. U. Sherman made haste over his signature to assail my statements as to summer deer shooting, proclaiming my accusation "a gross, and I believe, wanton libel on a class of men [meaning the guides, on whose testimony I largely relied for what I wrote] which, as a class, is as honorable and law-abiding as any engaged in trade or professional life." All of my statements have been amply confirmed by several of your correspondents who have since discussed the subject. But I cannot refrain from calling attention to the official confirmation which I received in the report made to this same Commissioner Sherman by his subordinate "Peter A. Leonard, Seventh District," quoted in FOREST AND STREAM of Feb. 12, 1885. Mr. Leonard says: "It is certain that the early slaughter of deer—in May, June and July—is carried on beyond the possibility of detection to a large extent in the several forest districts of the Adirondacks."

The "ignorance of 'L.'," on which this State officer dilated with so much vim and satisfaction, may now be contrasted with the ignorance of General Sherman, who knows (to accept his own statement) less about what is going on in the forest than does one of his subordinates.

It is hardly necessary for me to point out that this "early slaughter of deer * * * to a large extent in the several forest districts of the Adirondacks" could not be practiced without the assistance and contrivance of a great many guides.

NEW YORK, Feb. 4, 1885. L.

SOME REMARKABLE SHOTS.

Editor Forest and Stream:

I have read with much interest and amusement the relations of the many and varied "remarkable shots" in your columns, and I have been overhauling my own career, and ransacking my memory to find something remarkable in my own long record of commonplace hits and misses (the latter largely predominating). I have at last unearthed a reminiscence from memory's dusty storehouse, in which there occur a whole batch of remarkable shots, all made at one time.

In 1873 I was engaged in some engineering work on the Mississippi River, not far below Vicksburg, and was stopping at the hospitable house of old Mr. Sim Crow, a planter, and, by the way, the Mrs. Partington of that locality. When I showed him some pebbles I had picked up on the river bank, he observed sententiously, "There's a heap o' them putrified rocks about here. You find 'em in stratagems of sand and blue clay." The old fellow was very fond of a game of euchre, which we indulged in every night. Being at his house on Sunday he proposed a game. I demurred somewhat to the proposal, on the ground that my education and former associations gave me a prejudice against that kind of indulgence on Sunday. He looked very much hurt, and said, "Well, I like to see moralization going on myself, but I didn't think there was any harm in playin' a game of euchre." But, I am wandering sadly away from my "remarkable shots."

Mr. Crow's plantation was at the lower end of Davis's Bend Lake, a former bend of the Mississippi River, seventy-five miles long, which had been converted into a lake by a recent "cut off." Upon the inclosed island are the plantations of Mr. Jefferson Davis, ex-President of the defunct Confederacy. This lake was then, and is now, the resort of countless numbers of ducks and geese. They were "conking" and quacking and swarming about, day and night. I determined one night to try my hand on some of them the next morning. The lower end of the lake, for a quarter of a mile of its extent, was partially filled up with mud and sand, with some water in the depressions. This was the roosting place of vast numbers of the wildfowl.

I got out early in the morning, having in one hand a double-barreled shotgun heavily loaded with buckshot, and in the other a repeating rifle. I had only to walk about two hundred yards from the house to reach the bank of the lake. Here I saw in the depression below me, in the pools and on the mud, an immense congregation of ducks and geese, which had not yet taken flight for their morning's meal. The nearest ones were about one hundred yards from my position. I leaned the repeater against a stump, and raising the shotgun I lumbered away with both barrels into the thickest of the throng. Then quickly seizing the rifle I poured shot after shot into the retreating mass, until they were out of sight. Between my fusillade and the racket made by the fowl there was a terrible din for a minute or two. When silence was restored I descended to the battle-field, where I expected to find that the "peace of Warsaw" reigned, intending to remove the dead and wounded. My search was rewarded by finding one dead baldpate. I could discover no shot or bullet wound on him, and concluded that he was scared to death. COAHOMA.

MEMPHIS, Tenn.

Editor Forest and Stream:

About the year 1855 Van Ess Russell, on the beach of Lake Pleasant, Hamilton county, N. Y., shot a deer running directly from him. The deer fell dead, but upon going up to it no wound was discoverable. Upon dressing the deer, however, it was found that the ball had entered the vent and passed lengthwise of the body, lodging in the heart.

C. N. C.

PALATINE BRIDGE, N. Y.

OHIO GAME PROSPECTS.—Toledo, O., Feb. 10.—Yesterday a storm of rain and sleet left the snow (already nearly two feet deep) with a crust of two inches upon it, and to-day the thermometer is again below zero. This will prove extremely trying if not fatal to a great deal of the wild game of Northern Ohio, especially as the winter has been one of the coldest known here for a generation. In some cases the quail have to come into the barnyard, only to meet the sneaking, murderous house cat, and to be picked up one by one. Feed the birds and strangle the miserable cat.—B.

PRINCETON, N. J., Feb. 14.—Charles Hubbard, New Jersey's famous colored hunter, trapper and guide, died yesterday of hasty consumption, aged forty-five years. Hubbard was a favorite with Princeton College students, and was well known to many old graduates now living in different parts of the country. He was a Union soldier in the late war, and was well known in the West and South. He was a crack shot, a taxidermist and a snake trainer. He had few equals in his line of business. For a long time he was West with Prof. Scott, of the College of New Jersey.

EUROPEAN GAME BIRDS.—The trade in live European game birds is only in its infancy. Messrs. Chas. Reiche & Bro., of Chatham street, this city, have at different times imported several hundred European partridges and English pheasants. It will be seen elsewhere they now have a consignment on hand, and clubs desiring these birds for stocking purposes will do well to communicate with them.

NORTH CAROLINA.—Kittrell, Feb. 14.—The quail shooting has been good this year. Thirty to fifty a day to two guns is not unusual. Woodcocks are going north, a few being brought in every day.—D.

Sea and River Fishing.

HINTS ON TOOLS AND TACKLE.

CLICKS AND DRAGS.

Editor Forest and Stream:

In a recent number of your journal "Petra" wishes to know why both a click and a drag are used in the same reel. I think I can shed a little light on the matter.

As they now exist, in some reels, the combination might be termed a "mechanical tautology." But this condition is the perverted outgrowth of what was originally a valid and useful arrangement. The manufacture of the now famous Kentucky reel was first begun some thirty-five years ago. They were, and are still, made with a drag and an "alarm," both being operated by flat, sliding buttons. The use of the drag is obvious in such a free-running reel. The alarm consists of a piece of thin watch spring bent back upon itself somewhat in the form of an elongated "U," one end being attached to the sliding block, the other end free, to engage in the small steel pinion on the end of the shaft of the spool. This reel was originally made for bait-fishing only, and the "alarm" was not intended in any sense to represent, or subserve the functions of a "click" proper, the spring not being stiff enough to retard the action of the reel. It was invented to meet the requirements of still-fishing, where the butt of the cane rod was frequently stuck in the bank (often by a spike provided for that purpose), thus relieving the lazy angler from the necessity of holding the rod or watching his float while waiting for a "bite," until the singing of the "alarm" announced that welcome contingency.

Now a "click" proper is a very different affair from the "alarm" of the Kentucky reel. The former is a pall engaging, constantly and permanently, with the shaft pinion, and operated by a strong spring, so as to materially retard the action of the reel, and is used only in reels intended for fly-fishing. Originally all such reels were the single-action "click reels," but now many multiplying reels are made to subserve the same purpose by an "adjustable click," that is, a click which can be readily thrown in or out of gear. This is a very good arrangement, and all expensive multiplying reels should be constructed in this way, so as to admit of their being used for either bait or fly-fishing. In this case the adjustable click answers also all the purposes of a "drag," rendering the latter superfluous.

And now for the reason why the click and drag exist in combination in some reels. Of late years the popularity and excellence of the "Kentucky" multiplying reel induced Eastern manufacturers to imitate it. This would be all well enough if they produced an exact imitation; but not realizing the proper function of the "alarm," they substituted for it the well-known "click," and also retained the "drag," so as to conform to the outward appearance and ostensible construction of the Kentucky reel. As Mr. Wells says: "This combination reel was made to sell."

I have always advised those ordering the Kentucky reel either to have the alarm spring made stiff enough to act as a click, and to discard the drag; or to discard the alarm altogether, and have the drag spring made light enough to subserve the purposes of fly-fishing. I like the latter plan the best.

SNELLS AND GIMP.

In the snelling of hooks, any of the plans recommended by your correspondent will answer; I use wax and shellac varnish. The most important features to be observed in the operation are, when seizing the gut or gimp to the shank of the hook, to wind the silk closely and tightly, and to varnish it thoroughly with shellac. For hooks and flies for black bass, salmon or large trout, the best plan is that recommended by "Californian" of seizing a small loop of gut or line to the hook or fly, and providing a loop in each end of the snell. This is far superior to the old method of attaching the snell directly to the shank, for the reasons given; but for the smallest trout flies, or very small hooks, the latter plan may still be followed.

THE MOST SUCCESSFUL FLY.

Since the day of Charles Cotton "the most successful fly" has been a mooted question, and never has been and never will be answered satisfactorily to the craft generally, for while one particular fly may be eminently successful in some

waters, it must yield the palm of supremacy in others. Why this should be so will never be known. It is a question that can only be solved, after practical demonstration, by the fishes themselves in their particular waters, and anglers will never be able to reduce the matter to the certainty of a mathematical problem. This is another of the "glorious uncertainties" of angling that constitutes, to my mind, its greatest charm. Angling is an experimental art, and from the very nature of it must ever be so, for we can never hope to possess a thorough knowledge of the emotions, appetites, idiosyncrasies and "true inwardness" of the fishes themselves. JAMES A. HENSHALL.

CYNTHIANA, Ky., Feb. 10, 1885.

THE MOST KILLING FLY.

Editor Forest and Stream:

It requires more courage than I possess to name the trout fly that, at all times and on all waters, is the most killing. The best day's sport that ever I had with *Salvelinus fontinalis* was when I used an unknown fly that has brought me small returns since that day, nearly twenty years ago. I have had this fly duplicated by several fly-tiers, but none knew its history, if it had one. I could never recall how or where I got the half dozen that I found in my book; but the trout came for no other when it was placed before them on that memorable day. The best day's brook trout fishing I had last season was with the "green drake." The fish rose to this fly with such unanimity that I spent some time testing other flies on the same cast, but whatever the position of the green drake on the leader, it took almost all the fish. The gray drake, which is not greatly unlike it to the ordinary observer, was of no avail. A few days later the friend who was with me again fished the same water and the green drake was useless, while the coachman and fin-fly did the business.

The late Reuben Wood—peace to his ashes—in telling me of the origin of the fly that bears his name, said he was fishing certain waters where the trout were rising freely, but he exhausted his fly-book without a rise to his flies, and he had all the flies generally known to the fly-fisher as standards. He then put down his rod and caught some of the natural flies upon which the fish were feeding, and tied an imitation which the trout took readily. This imitation of a natural fly is now known as the "Reuben Wood." I could easily multiply instances where the well-known flies of the fly-book were unnoticed and some nondescript taken with avidity by the fish; but I should be loath to call any one of them the most killing fly, for a fly that will kill on one day in one stream may not kill on another day in another stream. If the most killing trout fly should be discovered, it would mar the kaleidoscopic appearance of our fly-books and do away with many a pleasant hour of uncertainty when the angler is engaged in fitting the proper fly to new waters.

It was of bass flies, however, that I sat down to write, and of the most tempting color for black bass rather than of the most killing fly in its entirety. Mr. Orvis says in a recent issue of FOREST AND STREAM that I will probably defend the fly that bears my name. I will, certainly, defend it for what it has done for me and my faith in it remains unshaken, but dealing in "futures" is risky—so a cotton-dealing friend tells me. One does not have to tax his memory severely to remember when the fly for black bass was a scarlet ibis or a fly with red the predominating color. I could go back of the ibis to the time when another fly was the fly, but after the ibis era claimants for bass favors sprang up rapidly, and the bass fly became obsolete. This was owing, undoubtedly, to the fact that as black bass fishing was recognized as one of the higher branches of the gentle art, anglers were not satisfied to use the tools that had been considered "good enough for bass" when *S. fontinalis* was king, but set about experiments to devise something fit for a royal table, as investigation had shown that the bass was not of plebian origin. Instead of the fly this game fish was offered a *menu* beginning with *huitres* and ending with *café*, and even then it declined many invitations to dine with its old and its new friends. As one of its old friends I—after I found by a trial of several weeks that it had little fondness for the red ibis on my leaders—spent most of three months, one summer, trying various colors and combination of colors to find which the bass liked best in a fly dressing. The result was that I concluded they liked any color if it was yellow, but did not object to other colors in combination with yellow. The fly looks as though it was ordered out for dress parade, but it is simply made for actual service. I have tried it on various waters and I have no cause to regret the time spent in consulting the taste of the black bass in regard to the proper hue of an artificial fly.

I looked over my fly-book this afternoon to see how many different bass-flies were contained therein having yellow in their composition. The "Ferguson," an excellent fly, has yellow body and yellow in wings and tail. Major Ferguson, of U. S. Fish Commission, tells me he originated the fly for Potomac river bass, but has found it attractive in all waters, and some of his friends have found it killing for Rangeley trout. Not long ago a gentleman writing from Pennsylvania described in print a fly that was famous for bass where he lived. It is called the "Sunbury," and it has a yellow body. The "Oriole," a very taking fly, invented by Dr. Henshall, has yellow wings. The "Oconomowoc"—a former pet name of Dr. Henshall's, and I judge that the fly was invented by him—has a pale or lemon yellow body. The "Mather," another good fly, has a yellowish green body and tail. The "Jungle Cock" has yellow body, wings, hackle and tail; in fact, nearly all yellow, but I have not found it as good as the "Black and Gold," having only yellow body and a slip of yellow in wings. The "Botts" has one-half of its body yellow. The "McLeod" has yellow hackle and tag. The "No Name" has yellow body. Prof. Mayer's "Lord Baltimore" has an orange body, with the yellow "eye" of the jungle cock showing in its wings. I speak of this fly as a bass-fly, and it has proven itself an excellent one, but Prof. Mayer made it in imitation of a natural insect upon which he had seen trout feeding, so that it won fame as a trout fly before it was offered to the black bass. Mr. Henry P. Wells designed the "Parmachenee Belle" for the large Rangeley trout of Maine, and for these fish it has proven a first-class fly. Mr. Wells fashioned the fly to resemble somewhat the belly fin of a trout, but it has a body of yellow mohair, and I have found it a very good black bass fly. Willson's "Professor" has a yellow body, and the bass like it, but I have named a sufficient number to show that yellow enters largely into the colors comprising a good bass-fly.

I do not think any of the inventors or designers of the excellent flies I have named would claim that his particular fly was *the* most killing. I remember reading that President Arthur had the greatest success with Florida black bass when using a yellow hackle, and in looking over some old letters from Miss McBride, who succeeded her father, John McBride, of Mumford, I find she says: "A yellow butterfly is the best fly for black bass in July, as a small yellow ephemera makes its appearance in June on streams that flow into lakes and ponds, or if the season is particularly advanced it appears the last of May." Miss McBride was not only considered by many anglers the best fly-tier of her day, but she was a close student of entomology as well.

It is a good rule to offer the black bass of ponds and lakes a large gaudy fly, either in casting or trolling, and the black bass of rivers and rapid streams a smaller and more somber fly. But I am no nearer the most killing fly than when I began this letter. A. N. CHENEY.

GLENS FALLS, N. Y.

Editor Forest and Stream:

Millard's red flannel-fly, as he tells it in your issue of the 5th, reminds me of my own experience in catching the wary trout with bait that was not a red ibis. Some years ago I was fishing on the outlet of Silver Lake, one of the most beautiful sheets of water to be found in the State. By some mishap I lost my fly-book and found that all I had to fasten on my line was a single snell and hook which I had fortunately left wound around my hat. I had no bait; it was difficult to find worms and hard to tear up the sod with only my hand for a hoe. A happy thought struck me. From the red morocco lining of my pocket book I cut a strip the shape and size of a small willow leaf. Through the wider end I put the hook and then two of the white petals of a daisy for the wings of this new kind of fly. My very first cast brought a nice trout and when night came my creel was nearly full. The body of my fly stood the hard usage well, but I had to furnish new wings with every catch. It was a matter of great wonderment to me that this improvised bait should be so "taking" when we think so much care must be taken in the make up of the flies we use to make the deception complete.

Another experience, although of a different kind, I would like to relate. Perhaps some brother sportsman can give me the "why" of it. I have never been able to explain it. I was fishing on Broadhead's Creek. After my day's work, which I had shortened that I might reach Oakland station in time for the night train, I put my tackle up, and with my companion started on our tramp. A few hundred rods from the main stream we crossed a little run, and as I stepped over it my foot slipped back into the water which seemed almost ice cold. I was sure that if there was some pool where the trout could lie we would find them and have some sport in this cool spring water. We laid down our traps and followed it some ways. When near its junction with the creek it spread out and became a little pond perhaps ten feet wide and three times as long. Peering through the brush I noticed this and told my companion to follow me along, but keeping some ways from the water, while I carefully crept up to the place. On my hands and knees I crawled along until near the overhanging bank, when I carefully opened the brush and looked in. Such a sight I had never seen before. There on the white gravelly bottom were perhaps a hundred beautiful trout lying quietly, hardly moving, save the gentle motion of their fins. I backed out as quietly as I came and told my companion of my "rich find." We knew that the only way to catch them in this clear, open place, was to keep entirely out of sight. I fixed my line and flies, and crawling up behind a bushy birch, inch by inch, I pushed my rod ahead until the line was clear of the bank, let the flies drop gently on the water. Before they fairly touched it, a splash and I had two hooked. Without rising I threw them back to my companion; after taking them off the hooks he drew the rod back, then pushed it toward me that I might again get my line out as I had done at first. This continued until I had landed thirty-two. But now the strange part of this adventure: After this I could not get a single rise. I whispered to my companion and one by one he changed the flies until we had tried every one in our books, but not a bite; then a hook with a worm, then a white grub, but no use; there they lay by the dozens and there they stayed until I called my friend and we both rose up. With a rush that fairly made the water boil, they went through the riff into the deep water of the large stream. We gathered up our trout—all measuring within half an inch of seven inches in length—and took the trail for the station. We were well paid for our hurried walk and the disappointment in missing the train by almost an hour. Will some one give me the "why?" SPICEWOOD.

CENTRALIA, Pa., Feb. 7.

Editor Forest and Stream:

I think that your correspondent who first propounded the query as to the best fly did it with reference to Colorado waters. In my experience there the coachman stood first, the grizzly king being next, while a brown hackle with green body, and gray hackle with green body, stood third on the list. With these four flies, adding perhaps a queen of the waters, one may fish successfully there in all months during the entire season. M.

SIZE AND WEIGHT OF BLACK BASS.

Editor Forest and Stream:

In common with "Woodcock," I have often wondered at the reports of the lengths and weights of black bass, as reported in the columns of the FOREST AND STREAM.

Have caught a great many black bass during the last eighteen years, and find my weights and measurements agree with "Woodcock's" table as given in your issue of Feb. 5. The fish measured were small-mouth black bass, fat and well conditioned. The largest caught last summer measured 21 inches in length and weighed 3 pounds 14 ounces, weighed two hours after it was caught. Now according to published accounts, a black bass caught in Lake George of 21 inches would weigh from 6 to 8 pounds. Now, brother anglers, let us hear from you. N.

ESPERANCE, N. Y., Feb. 9.

Editor Forest and Stream:

The inclosed list of measurements of small-mouthed black bass, taken in the month of May (at the Bass Islands, Lake Erie), when they are in prime condition, are in every respect correct:

Length.	Girth.	Weight.
12 inches.....	8 inches.....	..1 pound, 6 ounces.
14 "	11 "	2 " 6 "
15 "	11½ "	2 " 14 "
20 "	13 "	4 " 5 "
20 "	14½ "	5 " ..
21½ "	16½ "	6 " 8 "

I have plaster casts of each fish, with measure and weight marked on them when taken.

My impression is that "Woodcock's" bass were not well fed, for certainly a fish of this kind fifteen inches long and weighing only one pound and eight ounces, must have presented a very gaunt appearance. DR. E. STERLING.

CLEVELAND, O., Feb. 7, 1885.

Editor Forest and Stream:

Commenting upon the difference in the weight of black bass of the same length, as set down in a table by himself and "Poke-o'-Moonshine," your correspondent "Woodcock" says: "If they were small-mouthed I don't see how a table can be at all accurate in different sections of the country." In this statement he is correct; a table good for one section is useless in another.

Last summer I kept a record of some of the bass I took; they were small-mouthed, taken in Saratoga Lake. The measures are from tip of nose to ends of caudal fin: 17 inches long, 3 pounds; 14½ inches long, 1 pound 12 ounces; 13½ inches long, 1 pound 8 ounces. A table of the length and weight of brook trout good for Pennsylvania or New York is not accurate for Colorado or California. M.

VAGARIES OF FLY NOMENCLATURE.

Editor Forest and Stream:

In reading the FOREST AND STREAM for Feb. 12, 1885, I am somewhat puzzled by the following from the pen of Mr. Fred Mather:

"I have gone over and compared the list of names only in Holberton's and Orvis's list, without comparing the flies which are called by the same name, as 'White Hackle' found great differences there. On Holberton's plate there are sixty-four named flies, and in Orvis's list there are seventy-eight, yet Holberton names thirty-seven which are not in Orvis's, the latter omitting the Montreal and Alder flies, and naming forty which Holberton has not. Including hackles, I find that only twenty-eight names are used in common by these two authorities Orvis names brown coffin and also marsh brown, while Holberton gives both names to one fly which has a blue wing and is like the brown coffin of Orvis; the marsh brown of the latter has a brown wing."

I do not desire to enter into any controversy in regard to trout flies, or any of the implements used in fishing. Fear of this has many times restrained me from giving my opinions. It is always a pleasure to me to read the views of others, and it has sometimes been hard for me to keep still. In my recent letter I yielded to the temptation to "join in," hoping it might interest some of your readers to learn something more of the flies mentioned by other correspondents. I wrote only in the desire to exchange information and define my position as one who sought not to create confusion, but to ascertain a correct standard and steadfastly adhere to the same. I do not wish to assert myself in opposition to any one. I only give the conclusions drawn from personal investigations, hoping they may be of service to the angling fraternity.

To return to the paragraph quoted from Mr. Mather's recent communication. I say I am puzzled by his statement that "Orvis omits the Montreal and alder flies," for the Montreal is represented among the flies for Maine or lake trout fishing, in plate No. 3, fly No. 3. It was included among flies for larger trout, being so much of a favorite among fly-fishers for those fish, and it seemed unnecessary to duplicate the pattern among the smaller flies, as the only difference would be that caused by the size of the hook. In my previous letter I gave a brief account of my researches in regard to the Montreal fly.

The alder is third in the list of flies; it can be found on page opposite 171, plate No. 7, fly No. 37. It is an old English fly, and I could give authority for its general appearance from numberless writers. One finds mention of it in nearly every work on trout flies. Alfred Ronalds in "The Fly-Fisher's Entomology," classes the natural insect as follows:

Alder fly (orl fly, in Wales called the humpback). Order, *Neuroptera;* family, *Sialidæ;* genus, *Sialis;* species, *Lutarius.*

He says of it: "This fly comes from a water nympha. It is earlier on some waters than on others. It lays its eggs upon the leaves of trees which overhang the water, and delights to skim the brook, but it may also be found at some distance from it. Imitation:

Body—Dark mulberry floss silk, or peacock herl, tied with black silk.

Wings—From a feather of a brown hen's or peahen's wing.

Legs—Dark umber-stained hackle, or in case of need a black cock's hackle will answer tolerably well."

In "Superior Fishing" Mr. Robert Roosevelt, in speaking of artificial flies, says:

"I am indebted to Mr. J. James Hyde, a gentleman, who, though an amateur, is one of the most finished anglers and neatest dressers of a well imitated trout-fly in the United States, for the following directions for tying trout flies with the feathers of American birds." Among these directions are those for tying the alder, viz.:

Body—Peacock herl, tied with black silk.

Wings—From a feather of a brown hen, made large and full.

Legs—Black cock's hackle.

In "Game Fish of the North," by the same author, we find: "The fly-fisher, however, relies for his pleasures mainly upon his imitations of the *neuroptera* and *diptera*. The *neuroptera*, or net-winged insects, *florfliegen*, gauze flies, as they are called by the Germans, include the principal pets of the fly-fisher. Their bodies are long, tapering and delicate; their wings (four) almost transparent and marked with netlike veins. They keep in continual motion for the purpose of catching smaller insects, on which they mainly feed, and generally deposit their eggs in the water, where the grubs live from one to two years on plants or other insects."

Mr. Francis Francis, in his "Book on Angling," declares: "The alder or orl fly is one of the best flies that comes upon the water, and was a great favorite of the late Canon Kingsley." Mr. Francis Francis gives the same directions for dressing the imitation as does Mr. Ronalds.

Michael Theakston in his remarkable and exhaustive work classifying flies and their imitations writes of the "light dun" in a note explaining that it is "the alder fly of other writers," and says of the natural insect: "Wings better than half an inch; the top ones wear the shade of the outer skin of a dried onion, with faint mottles and crossings a shade darker. Is altogether of a dim ambery tinge and dim transparency."

Frank Forester in "Fish and Fishing" gives Ronald's formula for the imitation of the alder fly. Thaddeus Norris in Mr. Hallock's "Sportsman's Gazetteer" gives the alder as "clout body, black hackle, slate-colored wing." In the "American Angler's Guide," published many years ago by

Appleton & Co., Hofland is quoted as advising "a speckled mallard feather for the wing of the alder." So from the above and many other sources, and from samples from many fly-tiers, we are led to conclude that the peacock's herl for body, amber-colored hackle for legs, and wings of some slightly mottled semi-transparent feather to resemble the delicately veined wings of the natural insect are the requisites for imitating the alder fly.

I presume Mr. Mather refers to the old universally known "March brown" which by errror he speaks of as the "marsh brown."

In 1676 Charles Cotton wrote of this fly, placing it in his list of flies for the month of March, and calling it the "bright brown."

Mr. Francis M. Walbran, years later, says, "In speaking about the 'March brown' it is always well to ascertain which fly is really meant, the 'brown drake' as it is styled by Michael Theakston, or the 'red brown' which I have previously stated is called the 'March brown' in some districts. Mr. Aldam distinguishes them by calling the 'red brown' (a February fly) the local 'March brown,' and the 'brown drake' the 'March brown of Great Britain;' Jackson names it the 'great brown,' and some Yorkshire anglers the 'dun drake,' while in Wales it is called the 'cob fly.' This fly is a great favorite with the fish while it is on the water, in fact I have seen fish killed with it until the end of June; the female is a lighter fly of a more olive tinge than the male, and during its season I have generally found it answer well to use one of each pattern at the same time. The following is Mr. Ronalds's pattern for the female fly, which he has observed come upon the water a few days later than the males: 'Body pale olive green wool, ribbed with fine gold twist, legs a honey dun hackle, that is less bright than a golden dun, wings upright, from the quill feather out of the middle of a hen pheasant's wing.'"

Mr. Ronalds, in the "Entomology," further states that "the male has a chocolate hue and the female a green brown; it generally appears in great numbers upon the streams where it is found toward the latter end of March, and is very eagerly devoured by the trout. The fly lives three days in this state and then changes into the great red spinner." Also "The March brown is a great killer on the Dove. In Wales they make it as a hackle, with a brown mottled feather of a partridge and rib with pale green silk."

Mr. Theakston says: "The brown drake commences hatching the latter end of March, if the weather be favorable. She is a favorite leader with her craft through the spring; next in size and importance to the head of her class, the fairy queen or queen drake, to whom she resigns her supremacy; she casts the brown badge and becomes the brilliant amber drake, or the largest of the red drakes, erroneously called spinners."

Mr. Roosevelt, in "Superior Fishing," quotes Mr. Ronalds in regard to the fly, and recommends: "Body, sandy mohair, ribbed over with olive silk; tail, two fibers of a brown hen's feather; wings, from the mottled wing feather of a brown hen, which may be found of the exact shade; legs, a brown hen's hackle."

Mr. Thaddeus Norris gives the following: "March Brown—Brown body, ribbed with yellow silk, brown hackle, turkey wing." The fly-tiers of this country have seemed to unite on a morphadite representative, by making the wing of a chocolate brown, well represented by the wild turkey feather, and a body of olive-brown hue, ribbed with gold. I have never seen the March brown made with a blue wing, nor can I find any authority for so doing.

The brown coughlin, caughlin, coffin, as it is variously called, is a fly with a slate-colored wing, and is probably the one Mr. Mather has in mind when he speaks of the brown coffin. I should not like to be responsible to the originators of this fly for this last innovation in the name which has had a more cheerful sound heretofore. I will not write of the attributes of this fly, fearing to add to what may already seem wearisome. I will here apologize to Mr. Mather for my neglect in not stating more clearly in my note regarding the fly which he speaks of in the "Grayling" article—that I was the one suggesting name of the fly he describes. I recognized it by his description, and so gave name in note, not thinking of the propriety that I should sign the same.

Some one may question giving English writers as of authority in this country; but if we take their old well-known flies—named for many, many years, illustrated and discussed in their books—is it justice not to follow their models as far as possible and retain their names? What benefit can there be in further deviations and consequent confusion. As we make new combinations or imitations and find new materials to perfect the same, let us not deviate from the main idea; that is, if it be a combination merely, to adhere to the original; if it be an imitation, seek only to copy the natural insect by the most ingenious methods possible, with due regard to the trials and success of other people who have attempted the same task. Let us not be hasty in questioning their manner of imitation, lest we pass unnoticed some good reasons for the same. Consideration must always be given to the appearance of a fly in the water as well as when fresh and dry in our hands.

I believe that by a little careful study, patience and considerable reading in regard to artificial flies, relating to which there is a most charming literature, we shall in time unite upon what is most desirable.

I will here predict that the imitative theory will be more and more acted upon; flies with outspread wings; flies with double wings and elongated bodies, like the familiar dragon fly, and with a closer application of natural colorings are constantly being sought for, and proving themselves useful.

CHARLES F. ORVIS.

MANCHESTER, Vt., Feb. 12, 1885.

[Those who have the first edition of Mr. Orvis's book will find the Montreal fly figured on the plate opposite page 79, and the alder fly on the plate opposite page 157].

Editor Forest and Stream:

Thanks for calling my attention to the above communication from Mr. Orvis in time to append my explanation to his article. In my previous communication I had not the second edition of "Fishing with the Fly" before me, although I have it in my library. I took the first edition of that book, and entirely overlooking the list of "lake flies," compared the plates of "trout flies" with the sheet of "Standard Trout Flies," published by Mr. Holberton. Hence I did not find the Montreal in Mr. Orvis's plates, and the omission of the alder fly was one of those oversights which happen to a busy man at times. A second search shows that the fly is there, and I acknowledge the error. My object was merely to show how our authorities differ, and not to set myself up as one. The substitution of marsh brown for March brown was merely a typographical error.

A closer inspection of Mr. Orvis's plates shows that he duplicates seven of his eighteen "lake flies" in his plates of "trout flies," but the Montreal is not so duplicated. Concerning the "March brown and brown coffin," I merely stated that Holberton gave both names to one fly, and here again is an error in spelling, for the latter gives the name as brown coflin, and not coffin. I do not pretend to know the derivation of the name, but Mr. Orvis seems to have worked it out, or at least to have given the spelling of English authorities. I agree with him that we should follow the English nomenclature for flies which we have derived from English anglers, any other course creates the confusion of which several of your correspondents justly complain.

Leaving out all American angling works which describe flies and illustrate them with wood cuts, the only two who have published finely colored plates of flies which present them to the eye as they are made, and appear, are Mr. Holberton and Mr. Orvis. They leave nothing to the imagination as do Norris, Roosevelt, Scott, Frank Forester, *et al*, and therefore we can compare their flies to better advantage. I called attention to their differences and erred in omitting one fly from the list of Mr. Orvis, while the types made me mis-spell two other names. It seems to me that if there are any points to be settled, and differences to be reconciled, they are between the two gentlemen whom I have quoted as authorities.

FRED MATHER.

GAMENESS OF THE BLACK BASSES.

IN the last FOREST AND STREAM, under the title of "Camp Flotsam," and the sub-head of "The Elysium of Perennial Bass," your correspondent, and my old friend, "Wawayanda," knocks a chip off my shoulder in the hope of taking a rise out of me. In school-boy days, when any of us lighter ones thought the other fellow was too big for us, and that discretion was the better part of valor, the standard suggestion was that he should "take some one of his size." "Wawayanda" is a bass fisher by nature, taste and experience. I fish for bass only when trout are not accessible, and am not of those who think the bass the peer of the trout, even if he weighs pounds where the trout weighs ounces. Therefore instinct bids to beware of breaking a lance with so formidable an adversary. Falstaff says: "Should I turn upon the true prince? Why, thou knowest I am as valiant as Hercules, but beware instinct; the lion will not touch the true prince. Instinct is a great matter; I was a coward on instinct. I shall think the better of myself and thee during life, I for a valiant lion and thou for a true prince."

Here is the chip which he knocks off, and which the instinct of a Falstaff forbids to be picked up: "This leads us to assert another fact sustained by our experience, viz., that the small-mouth is a more vigorous fighter in waters where it is not a native; transplanting seems to infuse a new vigor and to add several degrees to their gameness. What says he of the Bigosh to this?"

I have said in print that there was little or no difference in the game qualities of the large and small-mouth black bass. I have argued this with "Wawayanda" across the mahogany, in the boat, and under a bark shanty. He still thirsts for gore. "Instinct" forbids, Macbeth says: "I dare do all that may become a man," and in this spirit will remark: My fishing for black bass, and by this generic term I mean both species, for I do not follow the nomenclature of Western New York and Greenwood Lake in classing the small-mouth as "black bass" and the big-mouth as "Oswego bass," has been limited to the Hudson River, from Albany to Hudson, in boyhood, when the catch was accidental while fishing for perch, etc.; the Delaware River from Lambertville to the Delaware Water Gap, in both of which rivers the fish are not native; among the Thousand Islands of the St. Lawrence; around Kelly's Island in Lake Erie; on the St. Clair Flats, near Detroit; the New Jersey lakes (fish not native); the Mississippi River between Dubuque and Prairie Du Chien; the James River, Virginia; and on the Tangipahoa and Notalbany rivers in Louisiana. This, I believe, comprises all the waters in which I have captured black bass, if we except certain Canadian, Western New York and Adirondack waters, where they have been accidentally taken while trout fishing. On this limited experience I do not feel like putting on the gloves with "Wawayanda," unless they are very soft ones and Captain Williams stands by to see that I do not get it too hard. Still I will venture to say that the big-mouth, inappropiately called "Oswego bass," has been underrated by anglers generally. My old friend Alexander Mosely, in life the editor of the Richmond (Va.) *Whig*, called him a *vulgarian* when we took him in the James River, and I often challenged him to nominate his fish before landing, but he always hedged.

If necessary I can refer to my published opinions on this subject between 1870 and 1879, which express the same sentiment herein given, that the big-mouth has been underrated. Dr. Henshall, in his "Book of the Black Bass" (1881) does not make the least distinction between the species in the matter of gameness, and I agree with him to this extent: Under a pound weight the small-mouth may be a trifle the gamest; from a pound to two pounds there is little difference, while both species after reaching three pounds weight degenerate in fighting qualities, and are not equal in staying powers to the light weights. I am aware that this is not the popular belief, but it is my own, and with King Henry VI. can say:

> "So first the harmless sheep doth yield his fleece,
> And next his throat unto the butcher's knife."

Therefore my scalp is ready for the knife of either "Wawayanda," A. N. Cheney, or any black bass fisher who may be after hair.

I do not seek a controversy in this, and only write in answer to a challenge. If wrong, as I often am, then it must be ascribed to a desire to defend a fish that I believe to have been slandered and maligned. The motto of our country might be changed from *E pluribus unum* to *Aut Cæsar aut nullus*, a free translation of which might be rendered "the best or nothing." We must be made to believe that a prima donna is the very greatest that the world has ever heard or we would not listen to her, the circus must be the "greatest show on the planet," and the angler must have the gamiest fish or none. Having never killed a salmon I think that fly-fishing for trout and grayling is the highest form of angling, and rank the black bass next. If near waters that do not contain these fish I will fish for what may come to hand, and have enjoyed bobbing for eels at night when that was all that could be had in the way of fishing. Not "sport," of course, but fun, and a thing to put in an evening when nothing better offered.

In this spirit I fish for black bass with a fly, if their ever-changing humor will permit it, and if they utterly refuse it then bait is resorted to. If it can be proved that the small-mouth is, at a certain weight, gamier than the big-mouth, then I will still claim that the latter is a noble game fish and well worth angling for. We can only speak from our own experience, and mine has been that the differences between these fish are trifling when at their gamiest weights, but that both fall off in staying qualities when large. I will not admit that the big-mouth is deserving of the epithets bestowed on him, which it seems fashionable to echo.

"Wawayanda" claims that the small-mouth is gamier in waters to which it has been transplanted, a claim that I cannot affirm or deny, as I do not consider that I am as good a bass fisher as he, nor have I had the experience, but would ask, how does transplanting affect the bottom dog in this fight, the derided big-mouth?

FRED MATHER.

CANADIAN SALMON RIVERS.

THE regular auction sale of Canadian salmon rivers is thus reported in the Montreal *Gazette:* About a hundred persons attended this sale to-day at the office of the Commissioner of Crown Lands in the government buildings. The audience was composed chiefly of salmon anglers and their representatives from England and the United States. Judging from the numerous diagrams and accurate descriptions furnished it would appear that the Commissioner and his aids have made good use of the time during which those privileges have fallen to the disposal of the provincial officers. The upset prices were, as is probably the case with many other things known only to the disciples of old Izaak, somewhat fanciful; and the bidding was therefore no criterion to the value of the property or the estimate which each angler might attach to his particular fancy. Still the bidding on the whole was brisk, and the prices procured were satisfactory to the department. Nearly $4,000 were realized from this sale. This amount will be the rental for the current year, and will continue to form part of the provincial receipts for other four years of the leases. There were 32 salmon rivers offered, 2 trout streams, and 3 nondescripts, said to be fit for pickerel and winnish. The latter were not bid for, and three or four of the so called salmon rivers failed to draw a starting offer or to go off at the upset figure. First on the list was the Metapedia River, with its tributaries the Casupscal and Amqui. These rivers have been for above twenty years in the occupancy of Mr. George Stephen, who is said to have purchased all of the riparian rights and to have spent considerable sums in guarding and improving the salmon fishing thereon.

After some lively bidding these streams and all others connected with the main river were adjudged to Mr. Whitcher, of Ottawa, for $260, who was supposed to be acting for Mr. Stephen. The next sold were two divisions of the Restigouche, which were bought by Dr. F. W. Campbell, of Montreal, and Sir Roderick W. Cameron, of New York, the former paying $200 and the latter $170. The Quebec side of Petapedia was awarded to the Restigouche Salmon Club at $100, to form with the New Brunswick half opposite a breeding reserve. A barren stream, the Little Cascapedia, was bought by Mr. Riopel, M. P., for $60. The river Bonaventure was divided into three sections, which were let to Mr. Thorne, of New York, for $285. Nobody would take the Grand Pabos, but the Little Pabos was let to Mr. Louis Cabot, of New York, for $150. Its neighbor, the Grand River, was bid for $50 by Col. Walker, of London, who has puchased the other riparian rights from the settlers. Three Gaspe rivers sold at high prices. They were bought for Bostonians by Mr. R. N. Hall, M. P.; the St. John was for Mr. Cooper, at $240; the York was for Mr. Barnes, at $340, and the Dartmouth for Mr. Lane, at $520. With the exception of this last one, the Gaspe rivers were controlled by purchasers of private grants along their banks. Mr. Hogan, of the St. Lawrence Hall, secured the Ste. Ann des Moutos River at $230. There was not much competition for it, but the upset price was unaccountably high. Mr. D. C. Thomson, of Quebec, took the Murray River at its upset value. The Escoumain was knocked down at $25, which was dear for an empty river. Sir Roderick Cameron bought the Laval River for $75. The Trinity fell to Mr. Gilmour for $105. The Moisic was adjudged to Mr. A. Fraser for the same price. Mr. A. P. Rogers bought the Little Saguenay for $345. This stream was offered at an upset price quite inconsistent with the balance of rights on it disposable by the department. The same might be said of the St. John, which was purchased for Mr. E. Price at $150. The river Mars, on which nearly all of the pools are in private property, was bid up by a stranger to $235, at which figure it also fell to Mr. Price. The famous St. Margaret was sold to Mr. Russell and Mr. Brackett respectively, the northwest branch at $310 and the northeast at $120. These prices were out of all proportion to the rights conveyed, as nearly all of the pools belong already to Mr. Willis Russell and his associates, who have built eight or ten cottages along the river and secured the lands bordering on the adjacent pools.

In addition to the rental paid in each instance, the lessee will be taxed with the cost of private guardianship, as the lessor does not assume any of the cost or responsibility of protection. The sums paid for rent are therefore about one-third of the cost to the several holders. It is very improbable that the federal government will spend any more of the public moneys to protect and improve properties used and controlled by private individuals. If the revenues are thus appropriated by the province and the usufruct enjoyed by tenants of an authority which does not contribute one cent toward their maintenance, the probability is that in a very few years the federal authorities will abandon them altogether. There was among the intelligent and enterprising persons assembled on this occasion, a pretty forcible expression of dissatisfaction with the prospect which existing circumstances present. They foresee decline and ultimate desertion of the salmon angling privileges which the official organization adopted at the time of confederation had done so much to cultivate and enhance. They all seemed to think that there has been a fatal want of foresight, enterprise and liberality in the administration of the salmon fishery interest by the present fisheries department, as otherwise the official control and uniform development of the whole salmon fishery would have been maintained. The short-sighted and illiberal policy which has displaced the provident and vigorous management of the salmon fishery interest was discussed in terms not by any means complimentary to the Minister of Fisheries.

It is worthy of notice that a subject which could at this time of the year attract together at Quebec so many intelligent and experienced business men implies something more lasting and valuable than the mere gratification of a passion for the sport of salmon angling. It evinces a much stronger appreciation of the recreative value of such facilities for reasonable but exhilarating enjoyments as the holiday visit

to a salmon stream among the wild woods and peaceful valleys of Canada invariably afford. A looker on at Mr. Lynch's auction room in Quebec this afternoon, who could almost fancy that he saw the salmon leaping in the angler's eyes, and fancied that each one felt as he secured his bid that he had gaffed his salmon and was wreathing the shiny captive in delighted smiles, would never believe that the instinct of sporting could have such a potent influence on the railway, commercial and legislative "operators" of the busy world, unless it was supplemented by hygienic gains that dollars and cents cannot buy in all the apothecary shops of the universe.

AN OLD MILLPOND.

A MAN is always learning something new in trout fishing, and last spring I had a new experience, and as this is the time for learning new wrinkles to put in practice next spring, I am going to tell it, hoping it may be of service at some time to some of my brother anglers. I will tell about my trip in full, as I think it will be interesting.

At 4 P. M. one day in early May, last spring, T. and the writer boarded a north-bound train with various bundles, in the way of valises, creels, rods, etc. A ride of an hour and a half brought us to our stopping place, and we were soon asking the station agent if he could direct us to a place where we could stay that night.

There was no hotel in the little village, but a hospitable farmer took us in, and supper was promised in an hour. It looked at this time very much as if a tremendous thunder storm was coming up, but as we had the fever strong upon us, we took our rods and rubber coats, and passed quickly down the village street and over the hill to a grove of darksome pines to explore an old mill dam which T. had fished before, and which he averred contained trout. A sharp walk of a mile brought us to the spot, and under some trees we put our rods together and I looped on a white-winged coachman and a ginger hackle, as it was growing toward dusk. I had made a few casts and had had a faint rise, when I suddenly became aware that a great darkness had fallen upon us, and as I looked up to see the cause, a scene of surpassing grandeur met my eye.

We were standing on the mountain side and could look down and up the beautiful valley through which rolled the river F——. Field upon field stretched the rich bottomlands, with here a patch of woodland and there a white farmhouse, while over all the landscape showed the tender green of early spring. In the distance across the vale rose the rock-wall ridges and pine crests of the opposite mountains. In the north and west dense legions of black clouds were rising deeper and deeper and hurrying southward attended by flankers of flying scud. A haze filled the air, and through it the sun shone blood red. Everywhere the air was full of a lurid yellow light. It was a weird scene. Even as we gazed the sun disappeared and a dense gloom settled over all, while the air was filled with dried leaves, whirled into the air by the storm wind of the coming tempest. A few heavy drops of rain fell. Evidently no time was to be lost if we would escape a ducking. Leaving the problem of the trout, we hurried into our rubber coats, undid our rods and struck down the hill for home. We made it, but after all it proved to be more wind than rain. The yellow look of the sky was explained by forest fires to the northward.

Next morning the rising sun found us preparing for the fray. A brisk walk of a few miles brought us to our stream, but to our dismay we found notices not to fish every two hundred yards of its entire length. Being law-abiding citizens, there was no angling for us, and with heavy hearts we turned our heads homeward. As we walked we agreed to go and try the old mill pond we had looked at the night before. We did not anticipate much sport, but we had come to go fishing, and go fishing we would, even if the gates of our Mecca had been closed to us.

So back we tramped two miles over the hill and through the woods, where ever and anon we heard the scream of the bluejay or the morning greeting of the robin, and once we were greeted by a rabbit, which sat under a bush, calmly regarding us with great round wondering eyes.

About 9 o'clock we arrived at the mill and commenced work. It was a peculiar place and merits a description. A little stream comes murmuring under brush heaps down the mountain, and suddenly rushes into the pond. This lies on a hillside and is really a trench about forty feet wide, three deep, and from four to five hundred yards long, lying at right angles to the stream. It is bordered everywhere, save in one spot, by a grove of tall hemlocks, which shade it deeply even at mid-day. Between these trees the banks were bordered by a young thicket. It was filled with clear, cold water, and the bottom was thick with dead leaves and pine needles, under which the trout hid themselves. A wood road ran along one bank under the towering pines. One end of the pond backed into a sawmill yard, whence came the screech of the log under the teeth of the saw, and the voices of the men as they rolled the huge logs toward the mill. Steam was the motive power here, and the little pond yielded its tithe of water only to fill the boilers. This same end of the pond was really in the farmyard of the mill house, which was only a short distance away behind a clump of evergreens. From this the pond ran through the grove into the woods beyond. It was a very pretty place.

We walked up the road a little way, the mill hands smiling good-naturedly at us and asking us if we were going to catch minnows. We put our rods together and I put a good lively worm on the hook, as it was impossible to cast a fly on the pond save at one spot. An instant dart, a trembling of the rod and I drew to land a 10-inch trout. The problem was solved; there were trout here and we set to work to get them. We each took one end, T. going to the upper while I took the mill end. Industriously I worked and finally caught a little fellow and nothing more. I grew discouraged and finally wandered down the little stream, and from one or two holes where the water swirled drew a fine trout. Under the bridge I took several, and so I worked on down through the meadows, just clothed in vernal green, while the mild, warm air was filled with the music of a thousand bird throats.

After fishing through several meadows I came to the railroad culvert, and here I determined to stop and see what T. had been doing, and help him investigate the lunch he carried in his creel. I tramped back, but T. was not in sight and not to be found, so I must wait. I sat down and looked over the contents of my creel, in which reposed a dozen trout, with several big fellows on top, lighted my pipe and gave myself up to reverie and the enjoyment of a mild spring day.

I tired of this after a while and went out and made friends with the sawyer's dog and talked to one of the workmen. "What luck?" "Oh, fair. Anything to be caught in this pond?" "Wal, there was trout here onct, but they're gone now, and when I goes a fishing I goes to the river." "What do you get there?" said I. "Oh, I get pickerel." As he spoke I saw several fine rises up the pond to gnats dropping in the water. I determined to investigate, and as I walked I prayed that every one would think like the wood sawyer and fish only in the river. Soon I saw more trout rising. I caught a fly on the water; he was a red spinner. I had his duplicate in my fly-book, but that did no good, for I could not throw it here. I sat and watched the trout for some time, and then an idea struck me. I put a six-foot leader of the finest drawn gossamer gut on my line, a tiny hook tied on the same, and then I chose a small, lively worm which I looped on. This I did away from the bank, and then crawling carefully till near the edge, without raising up I poked the rod tip through a gap in the bush fringe, and taking the hook in one hand drew down on the rod point till it was well bent, and then let go. The worm shot out over the water till the line straightened and then fell softly and sank. I remained lying flat down for several minutes, and then felt a jerk. Raising up I drew to me a fine trout. The secret was solved. There were plenty of trout, but they were disturbed so much by people passing that they hid under the leaves at the bottom and only came out sometimes when the coast was clear. If they got the slightest idea of any one's presence they would not bite. Then I changed my place, repeated the same tactics and hooked a large trout which I was compelled to play very carefully, owing to the delicate leader. In this manner I worked carefully over the pond, and in two hours had secured a couple of dozen, rejecting the little fellows. Then the interest waned, and I began to wonder what had become of T. Soon my shouts received an answer and he appeared. Then we discussed luncheon and told our luck while we ate. He had tried the upper end of the pool, but having no luck had gone up the stream, fishing both ways, and had taken forty, all rather small. When I told him to look in my creel, he was astonished at their size and determined to try my tactics, but he got nothing.

At length I persuaded him to desist and we then went down the road, T. catching his last under the bridge. We took the train for home tired, but happy with our luck and pleasant day, and I am firmly convinced that rules are worth nothing in trout fishing, but experience and ingenuity everything.

PERCYVAL.

NEW HAVEN, Conn., Feb. 5, 1885.

BASS FISHING IN THE OZARKS.

THE heat of July of 1883, and strict attention to office work during the dog days had resulted in its natural consequence of weariness and lassitude, when my soul was thrilled by a proposition from "Frater" to "take a trip down the James." Now, our Southwestern James, gentle reader, does not follow a tame and prosaic course, like its more celebrated namesake of old Virginia, but it is a swift and dashing stream flowing down the southern slope of the Ozark Mountains. It is clear as crystal, full of rocks and rapids and winds in a very crooked channel among the hills and overhanging bluffs of the roughest portion of Southwest Missouri. On the maps it is put down as the "James Fork of White River." It is also, and this is its chief attraction to us, moderately well stocked with that king of game fish, the small-mouth black bass.

The cars carry us twenty mile southwest to the little town of Billiings where we find a carriage waiting, and going due south for thirty miles, we strike the James at Webster, where we are to make our headquarters. Webster's farmhouse is just at one heel of an irregularly shaped "horseshoe bend" of the river, which after describing many a zig-zag curve for twenty-five miles, brings the other heel of the shoe only a mile and a half distant over the stony hills.

Here we have a comfortable log camp, and here for a week we tempt the gamy bass from the clear depths and draw in vigor with every breath of the crisp mountain air. Let me describe one day's sport of several we had.

It was a peerless morning with a gentle south wind just rustling the leaves, and not a cloud in the skies, that we started to run around the big bend. Our boat was an ungainly home-made affair, which would have required steam power at least to force her up stream, but as our trip is all down hill her size only adds to her steadiness and cargo's comfort. There were seven of us in all, including ladies and children. At the stern with a long paddle in hand stands old Bill Webster, a veteran of the stream, who has taken hundreds of flat boats and rafts down this swift course, and who knows every rock and eddy to be encountered.

On the little deck at the bow, "Rusticus" takes the first chance with rod and line, while just behind him "Frater" stands with boathook ready to fend off from dangerous rocks as we shoot the rapids, while the ladies and children occupy the waist of the boat. So we cast off, and instantly the old tub of a boat begins to toss her head and dance over the waters "like a thing of life," as the gusher hath it.

Meanwhile I am whipping the dashing waters as best I may, sending my Abbey & Imbrie spinner flashing here and there, and receiving occasional electric shocks as a swift flash of bronzed sides and a desperate tug and struggle proclaim the presence of the king of the waters.

No light, fancy tackle will do here. The boat is shooting along like a race horse, and when a bass strikes the hooks there is no chance to skillfully play him or bring him slowly to hand. Our tackle comprises a jointed sixteen-foot cane pole, with reel and silk line strong enough to stand the strain of both fish and boat; and while some of our enthusiastic brethren, who always—on paper, at least—catch their fish "according to Hoyle," with just the orthodox amount of playing and reeling, may sneer at our rough style; my word for it, if they had been of our party that day they would own that there was enjoyment and science, yes, absolutely science, in capturing a good bass in our way as well as theirs.

But I must not take your space to tell a tithe of the incidents of that day. The blood-stirring dash down the long rapids under the thousand-foot Virgin Bluffs; the repeated thrill of joy when, like a flash of lightning, a bass takes the hook and fights to get back under his native rock, like a water hen, as he is; the bivouac on a gravelly beach at noon, and the marvellous disappearance of substantials thereat; the thousand beautiful views of river, hills and forests, changing at every turn, until we sight the mouth of the Jackson Hollow and find the boys waiting with the wagon and saddle horses, which convey us, boat and all, with our string of twenty-four beautiful fish, back to Webster and sweet repose.

As I write the sleet taps at my windows and the north winds rattle the blinds, but I mentally vow that when the leaves bud again I will be found with rod and line breathing in strength and vigor, and, perchance, taking a few bass meanwhile. And may all the brethren of the FOREST AND STREAM family be permitted to "go and do likewise" is the wish of

RUSTICUS II.

NORTH SPRINGFIELD, Mo.

THE VERMONT FISH LAW.

Editor Forest and Stream:

Is not "Awahsoose" in error as to a black bass measuring 9½ or 9¾ inches long weighing a pound? The evidence of "Stanstead," who corroborated his testimony with table for FOREST AND STREAM, before the legislative committee, was that a bass of that length would not weigh a half pound. I thought as "Awahsoose" does, and got the committee to make the length six inches, but on the showing made by "Stanstead" and others it was restored to ten inches, and I believe they were right. The objections he makes as to the close season for pike-perch were also presented before the committee, and the time shortened to June 1, but it was demonstrated to the committee that to make the law effective to stop net fishing it must be June 15, and that date was restored in the House. The thus far very profitable pound net and seine fishing at the north end of the lake is very fast depleting these waters of fish, and especially of pike-perch. Heretofore the seizure and destruction of the nets, with the fining of the fishermen, if caught, have been the penalities. Now the seizure and confiscation of the fish is added, and to make that effective, to take them in any way is made illegal to June. 15. This shuts off all pretense that any fish that may be seized were taken with hook and line, and hence not liable to seizure. If something had not been done to make the statutes against net fishing more effective, neither "Awahsoose" nor anybody else would have been able to take pike-perch with the hook and line at any season of the year, because there would be none to take. I have enjoyed the early fishing for many years, and should be glad to continue to enjoy it, but if "Awahsoose" could hear the testimony and know the facts he would commend instead of condemn the Legislature of 1884. It took decided steps in advance, and did provide funds to pay for enforcing the law forbidding net fishing.

H. A.

THAT DUCK CAPTURE.—Louisville, Ky., Feb. 10.—*Editor Forest and Stream:* In the Washington *Star* there is a reported capture by Senator Hampton of a wild duck while fly-fishing. This is a very good fish or duck story, but will it bear analysis? The correspondent says the Senator first cast the fly at a distance of sixty feet. He does not state the distance at the second cast, but I presume the distance was about the same as at the first, inasmuch as he says at the first cast the duck was struck on the back with the fly. Now the question is, is there a fly-fisher in this country or any other country who can cast a fly sixty or fifty or forty feet without retrieving at least once before attaining even the minimum distance here mentioned? Such being the case, would not the act of retrieving frighten the duck so that it would not be taken?—X. Y. Z.

BASS OFTEN TAKEN IN WINTER.—*Editor Forest and Stream:* Say to your Swedesboro (N. J.) correspondent that black bass have frequently been taken while pike fishing through the ice in the stocked ponds of his county during the past five winters.—M. P. P.

MR. THOS. MALLESON, late with Mr. T. J. Conroy, this city, is now connected with Mr. Fred. Malleson, South Sixth street, Brooklyn, New York, where he will welcome any of his many old friends who may call.

Fishculture.

SHELLFISHERIES OF CONNECTICUT.

WE have the fourth report of the Shellfish Commissioners of Connecticut to the General Assembly, January session, 1885. The rapid growth of the oyster industry has brought a variety of novel questions such as the arbitration and adjustment of disputes between adjoining owners of oyster grounds, conferences with oystermen to fix a just valuation in order to secure a satisfactory basis of taxation, negotiations to secure grounds for signal stations upon the shore, making maps of the oyster grounds within the State, etc.

Since June 1, 1881, the total number of applications received is 576, covering an area of 88,964 15-100 acres; of which area 45,045 58-100 acres have been designated; and they have netted to the State the sum of $49,560.03. If to the foregoing designations, made by the Commissioners, you add the designations previously made by the towns, the total area designated in State jurisdiction will be found to be 79,018 9-10 acres, of which 14,066 acres are cultivated, and 64,962 9-10 are uncultivated. The total number of taxpaying cultivators in 1882 was 216; in 1883 it was 280; in 1884 it was 385, of whom 16 own each 5 acres and under; 53 own each between 5 and 20 acres; and 332 own each 20 acres and more.

That there is a steady growth in the oyster industry of the State is obvious in many ways. One of the most striking proofs is the rapid increase in the number of steamers employed. There are already in the business forty steamers, with an aggregate carrying capacity of 36,720 bushels.

Another proof of the growth of the business is the great increase of shipments of seed and grown stock to neighboring States. The quantity of seed shipped is increasing annually, although the price per bushel is considerably less than formerly. Still, this is probably the largest and most profitable branch of the oyster industry of this State to-day. The distributing of oysters in the shell and in kegs and cans to all parts of the United States is carried on all the year round. With increased freighting facilities and improved preserving appliances, the trade is constantly growing. Probably no stock is produced on the Atlantic coast that reaches the consumer in better condition, after a long journey, than that shipped from Connecticut at any season of the year, even in the hottest summer months.

The plague of starfish has increased in some waters, while in other beds there have been none. In reply to the question put by the Commissioners, where do they most abound? the answers were various; but a fair deduction from them shows that they are found at all seasons of the year in all salt waters of the Sound; that they remain on the natural beds and other grounds where the young seed oysters are as long as they find food abundant, and then they attack the neighboring cultivated beds. They are quiet in July and August, when they form into large bunches or rolls for spawning. They are most destructive in the fall, winter and early spring months. They are rarely found on mud bottoms; they seem to prefer hard clay or rocky bottoms, and they gather about the headlands and on lines running off from the headlands into the Sound. The depth of the water seems to make no difference

to them. Many insist that it is on natural beds where they most abound; others, with equal positiveness, say that they are no more abundant here than elsewhere. As efforts are continually made by cultivators to keep their own grounds clear, and as no such efforts are made on the natural beds, it would not be strange if they were abundant there. It is also asserted that they breed on neglected grounds, of which there are many hundred acres scattered among cultivated beds. They also breed among inaccessible reefs and rocks, and when large enough begin their depredations upon the nearest beds.

In reply to the Commissioners' question, what would you recommend that the State should do toward their extermination? the answers were various. The principal ones were in substance:

"The State should pay a bounty on every bushel caught on the natural beds." "Steamers should be permitted to dredge on the public beds where the stars abound the most, especially in breeding time." "The time is not far off when the oystermen will reduce them so that they will be little trouble, especially when they get the grounds all planted; but cannot see clearly how the State can do anything without heavy expense, which will finally come back on the oystermen again in the way of taxes." "Let every man keep a good look out for his own grounds; as fast as they gather work on them and clean them out, and let the State clean the natural beds, and all will be well." "Enforce the law against throwing the stars back into the water when once caught." "Let the steamers dredge for oysters on the beds and catch the stars at the same time." "The oystermen should catch all they can." "Let each and every man take care of his own plantation and look out for his own interests." "Leave the work with the Shellfish Commissioners." "Let the State pay half the expense of cathing them." "Let the State employ steam oyster boats, when they are not busy, and catch them when they are bunched." "Let the State keep two or three steamers to render aid to those who have no steamers." "Sell all the natural beds in small lots to the highest bidder, or else put a high bounty on the stars." "Appoint a special committee of inquiry and report to the Shellfish Commission or to the Legislature before February 1, 1885." "Pass a law compelling, under heavy penalties, all parties to catch off the vermin from their unoccupied ground; steamers on the natural beds would not do any good; the stars must be exterminated some other way." "Offer a bounty, make the stars into a fertilizer and sell it to the farmers; it will pay a part, if not all the expense." "The State should do nothing."

In view of these differences of opinion, it is difficult to come to any satisfactory conclusion as to what, if anything, ought to be done by the State.

The Commissioners have discussed the subject in their previous reports—and they have but little to add. Certainly any attempt to introduce steamers on the natural beds would only result in the repetition of those conflicts between the oyster cultivators and the "natural growers" (as they are commonly called) which were so prolonged and so bitter, and which occupied so much of the time and attention of the Legislature a few years ago, to no good result. The Commissioners believe any attempt to introduce steam would be opposed strenuously by a large majority of respectable citizens.

LOCHLEVEN TROUT.

SHORTLY after the arrival of the Lochleven eggs sent to Prof. Baird from Sir James Gibson Maitland, Bart., we republished a note from the London *Fishing Gazette*, in which it was claimed that the fish was identical with the common brown trout of Europe, *S. fario*. Although not personally familiar with the fish, we expressed surprise at the statement, because it was not in accord with the authorities in ichthyology. As a matter of public interest we are permitted to publish the following letter on this subject:

"I am very glad to hear the Lochleven eggs arrived safely. The Lochleven trout can only be included under *S. fario* in the sense that a bull trout (*S. eriox*) or the sea trout (*S. trutta*) are included. Lochleven is a lake of between three and four thousand acres, fully one-half of which averages a depth of 12 feet. The lower end and center of the lake vary from 40 feet to 80 feet in depth. The summer temperature is between 50 and 60 degrees Fahrenheit; the winter probably not below 40 degrees; the deeper parts probably above 46 degrees.

Until the beginning of the present century there was free access to the sea, and probably a few centuries ago the Lochleven trout was thoroughly migratory. About fifty years ago the loch was reduced to its present size, 1,000 acres being drained, the surface lowered six feet, and sluices constructed at the outlet for the accommodation of mills on the River Leven below. The *S. levenensis* is found in the River Forth, in Loch Lomond, and other lakes of the west coast of Scotland and also those of the northwest of England. It crosses readily with *S. trutta* (sea trout) and *S. fario* (common trout); the offspring are fertile. It hybridizes with *S. salar*. The offspring of *S. levenensis* (female) and *S. salar* (male) have hitherto been sterile, those I have are now in their fourth year. The offspring of *S. salar* (female) and *S. levenensis* (male) which I have are as yet too young to determine sterility, but this cross is much easier made and the ova more prolific than in the former.

The Lochleven trout still retains many characteristics of a sea-going salmonoid, such as the parr marks, the silvery smolt livery, the forked-tail grilse stage, with its small proportion of spawners, diminutive eggs (40,000 to a gallon) and tender, delicate embryos; and its mature state, with a square tail, strongly developed hook on the under jaw of the males, large eggs (27,000 to a gallon), producing strong, well-formed, vigorous embryos. The practical difference between *S. levenensis* and *S. fario* is that the former has a much larger number of cœcal appendages and a stronger stomach, enabling it to crush the *Limnia pereger*, on which it largely feeds.

Day in his "Fishes of Great Britain and Ireland" only makes four species of Salmo, viz.: two of Salmones and two of Salvilini, including fontinalis, I suppose, temporarily as a species under the latter, the fish not having been sufficiently long established here for exhaustive study. Crossed with *Salmo alpinus*, variety *S. willughbii*, local variety *S. struanensis*, the progeny are fertile.

Of the two species of Salmones one is the true salmon *S. salar*, and 2, *S. trutta;* while he ranks *S. levenensis* as 2 A, and *S. fario* as 2 B. The varieties of *S. fario* are numerous, and if *levenensis* retains its rank as a sub-species, one at least of these, *S. estuarius*, should probably be transferred to it. I inclose a synopsis of species arranged from Day, which I hope will make the position of *levenensis* intelligible.

SALMONIDÆ.

SALMO.

Sub-genera A.

Deciduous vomerine teeth—Salmones.

a. About eleven rows of scales in an oblique line from adipose dorsal fin to the lateral line.

1. Salmo salar.....The salmon.

b. Fourteen or more rows of scales in an oblique line from adipose dorsal fin to the lateral line.

2. Salmo trutta.....The sea trout.

VARIETIES.

(*a*) Salmo albus, under which Day includes S. eriox or S. brachypoma, in other words, bull trout.
(*b*) Salmo cambricus, commonly called the sewen.

2 A. Salmo levenensis.....The Lochleven trout.
2 B. Salmo fario.....The common trout.

VARIETIES

(*a*) Salmo orcadensis.....The Loch Stennis trout.
(*b*) Salmo ferox.....The ferox.
(*c*) Salmo cornubiensis.....The Cornwall trout.
(*d*) Salmo nigripinnis.....The black-finned trout.
(*e*) Salmo estuarius.....The Galway sea trout.
(*f*) Salmo stomachicus....The gillaroo.
(*g*) Swaledale trout.
(*h*) Ciassapuill trout.

Sub-genera B.

Vomerine teeth restricted to near the head of that bone—Salvilini.

3. Salmo alpinus.....The alpine char.

VARIETIES.

(*a*) Salmo perisii.....The Welsh char.
(*b*) Salmo willughbii.....The Windermere char.
(*c*) Salmo killinensis.....The Loch Killin char.
(*d*) Salmo gravii.....The Lough Melvin char.
(*e*) Salmo colii.....The Lough Eske char.

4. Salmo fontinalis.....The American char.

All British char he places as varieties of 3, *S. alpinus*. Your American brook trout he ranks as *S. fontinalis*. Talking of brook trout, in Europe it would be safer to call them brown trout, otherwise they are apt to be confused with *S. fontinalis*.

I have not yet completed my investigation into the Schoodic salmon, the specimens being too young.

J. G. MAITLAND.

HOWIETOUN FISHERY, STERLING.

CARP VERSUS TROUT.

Editor Forest and Stream:

In the FOREST AND STREAM of to-day I note "Penn's" second article explaining what seemed to him a practical method of trout culture. I admire his enthusiasm, his earnest desire to retain in its native waters this peerless fish, and it seems to me that almost every possible plan that can be suggested was, during a term of ten or twelve years, tested by myself personally or by others under my personal direction. I have in my mind's eye several places where "Penn's" identical plan has been tested and for a number of years, but nothing akin to success has been attained by any method whatever. In quite a number of instances I have visited places where success had been reported, sometimes traveling long distances. In every instance I have found that the experiments had resulted in total failure. One of the best trout streams I ever saw was within two miles of the spot where I was born; in the Green Mountain range in Massachusetts. It was a small stream heading in the virgin forest, passing down a succession of little falls over the rocks, and then taking a zigzag course through a long meadow, both sides of the stream being lined with full-growth alders. Some twenty-five years ago this meadow changed hands, and the new owner, commencing at the lower part, cut off the alders and straightened the stream from year to year until he had transformed it according to "Penn's" ideas. I visit there every year or two and have been perfectly familiar with the results. Parties going there in the trouting season would commence in the best "holes" in the forest and then pass down the line of alders. When they emerged from the alders and dropped their lines in the grass-covered ditch their catches at once fell off, and ceased altogether a short distance below the limit of the alders.

I will repeat, perhaps for the fiftieth time, that the only practical way to keep up even a limited supply of trout in our native trout streams is to keep them in a state of nature, and then if they are subjected to a satisfactory amount of angling they must be restocked annually by artificial hatching. I believe this will be found true for all coming time, as it has been for many years past.

And now a word for carp. I clip from a paper now being circulated by Pennsylvania farmers, proposing legislation:

"Carp culture is becoming a remarkable industry in this country. It is essentially a farm industry. It can be carried on with great profit, upon a large majority of the farms in this State, with practically no risk, with small outlay, with trifling attention, and without interfering in the least with any other branch of farm industry. It is believed that about 3,000 persons in the State have commenced the business, mostly in a small way, and in the entire country 35,000 persons have made a commencement. Wherever the business is started systematically, in simple but properly constructed ponds, the results are successful to a degree far surpassing any other branch of farm industry hitherto attempted. The simple placing of a few carp into such waters as you chance to have will result in nothing practical. Most beginners are doing this, and will thereby bring even systematic work, for a time, into disrepute, and greatly retard its general success. Carp culture is totally unlike any other branch of fishculture, and special experience is required to place it promptly upon proper footing; without this years of time and hundreds of thousands of dollars will be wasted in this State. The loss from misdirected efforts is already heavy. In order to understand the misapprehension which exists among thoroughly intelligent men regarding this industry, the reader is advised to obtain from their member of the Legislature, or local agricultural society, a copy of the State Agricultural Report for 1884, just issued, and in the middle of the book, State Agricultural Society Report, read pages 17 to 25, and then turn back to Board of Agriculture Report, page 229, and read that paper.

"According to the best of our information and belief, the principal impediments in the way of universal success are a want of the simple, practical knowledge for the proper construction of ponds, upon different and ever-varying sites, together with some slight but absolutely necessary instructions from time to time, during the first two years, as to management."

M. P. P.

PHILADELPHIA, Feb. 12, 1885.

THE NEVADA COMMISSION.—The biennial report of the Fish Commissioner of Nevada for 1883-84, is at hand. At the time of appointing the Commissioner, the waters contained only two or three native species of fish, and these were becoming scarce. It is now nearly eight years since the first fish were transplanted to Nevada waters. The McCloud River salmon planted in the Owyhee and Colorado rivers, the only ones that discharge into the ocean, have grown, but it is not known that they have spawned. The land-locked salmon, furnished by the U. S. F. C., have been caught in the Truckee and the Carson, which have given numerous good catches. The Eastern brook trout have been planted in the Carson, Walker, Truckee and Humboldt rivers, with what result is not yet known. White bass, from Lake George, N. Y., grown wonderfully in Washoe Lake, some weighing three pounds, while the catfish from the Schuylkill, Pa., have bred freely, and the Carson and Virginia markets have been to a great degree supplied with this fish.

Answers to Correspondents.

Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **2113.**

THE FOX-TERRIER CLUB.

Editor Forest and Stream:

I send you inclosed a report of what was effected at the meeting on the 10th inst., for the purpose of forming or taking steps toward the organization of an American Fox-terrier Club. The meeting was called for 8 o'clock, but was first postponed till 8:30 o'clock, and then till 10 o'clock, on account of a meeting of the Eastern Field Trials Association (?) at which a number of gentlemen present were equally desirous of attending.

At a few minutes before 10 o'clock the meeting was called to order. Fourteen gentlemen were present. These gentlemen organized themselves into a temporary organization for the purpose of forming an American Fox-terrier Club. Mr. Edward Kelly was appointed temporary chairman, and Mr. A. E. Godeffroy temporary secretary.

On a motion of Mr. Hitchcock that a committee be appointed to draft by-laws and a constitution, and to prepare suggestions for a standard to be adopted by the club, also to obtain from England as soon as possible a copy of the by-laws, constitution and standard of the English Fox-terrier Club, all of which to be submitted at the next meeting.

The chair appointed the following committee: L. Rutherfurd, J. E. I. Grainger and E. Kelly (*ex-officio*). The meeting then adjourned subject to the call of the chair.

About thirty gentlemen have designated their willingness to join a definite organization.

It is intended to have the club fully organized for the New Haven show, or at least for the New York, to give valuable prizes for dogs belonging to members, and to push this specific breed of dogs to a more uniform standard of perfection.

A. E. GODEFFROY, Secretary pro tem.

NEW YORK, Feb. 16.

SIZE OF BEAGLES.

Editor Forest and Stream:

According to promise, I will give my opinion on the proper size of beagles for work. These ideas are not theoretical nor whimsical, but are practical and formed by close observations.

After much thought and experience, I have come to the conclusion that 14 inches is the proper size of beagles for work. The bitches should not be under 13 inches and the dogs not over 15 inches; for when you get above that height, just as well call them foxhounds at once. I have tried the 10-inch beagle, and after several years of great trouble and disappointment, have become thoroughly disgusted with them, and can say from experience they are no good.

Now, don't understand me to say that a beagle under 13 inches is worth nothing, for there are exceptions to all rules. I speak of them as a class. They may answer all purposes for the park hunting of England, but when they come to beating their way through weeds, brush, briers, and in swamps, they haven't the vitality to stand it; they may get through all right one day, but the next morning you will find them looking hollow, their feet will be sore, and they will be out of time altogether. But the 14-inch beagle will follow the rabbits through thickets, swamps, briers and brush, and be as fresh at night apparently as when starting in the morning.

He should have a good, strong neck and shoulders, good breast, but not too broad, short, strong back, well arched at loins, hindquarters reasonably far under him, good feet, not so small that he wil get foot-sore, and my word for it, he will make a dog for six days in a week hunting.

A prominent breeder wrote me a few days ago that some breeders who advocated the ten-inch beagles are changing a little more time and the most of them will change to the fourteen-inch ones. These little ones may do well for pets, and not very well for that, for when you get a case of distemper or mange they haven't the constitution to pull through and you have a dead dog, or, what is worse, a loathsome nuisance. What we Americans want is a dog large and strong enough to stand hard work, for when we get a day or two off we can't afford to have a dog to run himself out and take his place at our heels. Another disadvantage is their weak tongue. My chief pleasure is to listen to the cry of the

pack, and breeders ought to breed for tongue as much as for other desirable qualities. A clear, round note is the beauty of the beagle, not the little squeal we so often hear.

I have one old warrior in my pack whose note is as clear and loud as a "bugle blast." In fact, I won't have one that does not have a good, round note.

Now, I have treated this subject as briefly as possible—in fact, too much so; and I hope no one whose ideal is the ten-inch beagle will think hard of the abrupt manner in which I have spoken of his pets, but let him put his theories in practice and he will come to the fourteen-inch beagle.

WOUNDRY.

PINE VIEW, Va.

ENGLISH KENNEL NOTES.

XXIV.

EVERYBODY'S opinion of the Crystal Palace exhibition of dogs, "The best show ever held and the worst judged." In merit and numbers it was an unequalled gathering, and never have I heard a more universal and unanimous condemnation of the awards. It is well, indeed, that the press do not insert complaints from disappointed exhibitors, and the contractors for the contents of the editor's waste-paper baskets should have good weight this week.

There was a comical side to the anguish of those who had expected much and received little as they ran from friend to friend culling sweet drops of sad consolation. "But what does Doyle know about setters, oh, my?" "Where did Byron get his information about sheepdogs, oh, Lor'?" "Who elected them to judge; where's the joke, great goodness?" The replies to these frantic queries were vague and insincere. Some said, "You know it before; why did you show?" Others hinted that the judges were chosen at a sparse meeting of the committee when nobody was there who "knew." There is probably some foundation for this last suggestion, but though it may exculpate the committee, for ignorance is a sound excuse, it does not clear those whose weak-minded vanity prompted them to accept offices for which they must have been aware they totally lacked capacity. This belongs to the same class of moral offense as willfully perverting the truth to one's own glory. It is acting a dishonest white lie to the confiding exhibitors.

As I have before said, the entries were benefited by this ruse. When a competent man is advertised to judge, the owner of a third-rate dog says to himself, "It's no good my sending Tray, he'd stand no chance with Brown;" but when Mr. Noodle is elected, he reasons, "True, Tray is no flyer, but Noodle doesn't know a good 'un from a bad 'un, so I'll speculate a sovereign." And Tray's owner was right, for the first were last and the last were first, and judges dropped on the winners like dipping in a lucky bag.

And so I roamed round the Palace hearing and listening with sardonic and unruffled good humor. "We have all of us sufficient fortitude to bear the misfortunes of others," said the French cynic.

One hears a good deal of the "leveling influences of the hunting field." I think the dog show might be added. The drinking bars were doing unusually well and the corks popped a merry accompaniment to the canine chorus. Those who should have won and were disappointed, sought comfort in the flowing S. & B., others who expected nothing and got everything, joyfully celebrated their success in the wine of Champagne. They were seized with "Johnston's jolly," as described by Bret Harte, which

> "—was a wild desire to treat
> Every able male white citizen he met upon the street;
> And there being several thousand—but this subject why pursue?"

Fortunately, as Mrs. Prig told her friend Mrs. Gamp, "the drinks is all good."

Printed on the first page of the catalogue was this salutary innovation that will now probably be the rule at the London shows: "Mr. A. J. Sewell, M. R. C. V. S., will make a veterinary examination of each dog before entering the show." This is the wholesome outcome of the Lochinvar correspondence. It is greatly to the credit of the chief actor in that scene that his persistive blows aimed at high and low should have forced upon the Kennel Club a step so important and needful. The labor of critically looking over each dog at the entrance of a show of 1,600 dogs must be enormous, but so is the confidence and ease of mind it inspires in the exhibitors. I heard of several doggy Peris who stood disconsolate at the Crystal Palace gates. The majority of the rejected I believe were suffering from distemper, others were covered with dog lice, etc., etc. The Kennel Club should publish a list of them in the *Gazette*, and in cases where the veterinary surgeon had reason to believe that dogs suffering from infectious diseases were wilfully sent I think the owners' names should also be published "to encourage the others," as they say in France.

On the fourth day, Friday evening, after the show had closed, a cowardly outrage was perpetrated by some scoundrels who mutilated the champion blue Bedlington terrier dog Stonehouse Bob, by cutting off one of his ears. It is hardly possible that one man could have done this alone as it is said the wound was cauterized. I cannot resist inferring from the facts that the author of this deed had for his accomplice one of the show's keepers. The Kennel Club has, with commendable promptness, offered a liberal reward, £20, for information that will lead to a conviction of the actual offender. The whole kennel world would rejoice at the discovery of the pusillanimous brute who seems to have wreaked his personal wrong on a dumb and defenseless animal. The victim, Stonehouse Bob, whose show career this must close, is the winner of several first prizes and only just in his prime, so the pecuniary loss to his owner is also of some consequence.

From dog to dog the show was a dreadful length; only a postman in good training could have enjoyed it. The judging was all behindhand as usual. Some of the judges were punctually at their posts ready to commence at 9 A. M. sharp, but there were neither ring-stewards nor keepers present to fetch the dogs off their benches into the ring. It got so late that several classes had to be put off till the following day. The Dandie judge was unable to attend on Wednesday, so the Rev. Mr. Mellor reigned in his stead.

At former shows the Kennel Club allowed no readmission without repayment. That was an uncivilized regulation and provoked the boundless contempt of every decent person. This time they granted readmission tickets to gentlemen between 1 and 3 P. M., and the ladies all day. I should be glad to know to whom this meanly conceived indulgence is due; what was formerly scornful he has made ridiculous. Before, visitors despised the huckstering littleness of the club, now they are laughing at its cautious favor. Under the heading of "The Kennel Club vs. Nature," the *Stock Keeper* publishes a censorious protest from an indignant visitor, who suggestively signs himself "Gulliver." The editor in a footnote appears to agree with his correspondent, that it is hard lines he should have to wait till the Palace takes fire.

To peruse the different reports through our kennel press is an amusing form of self-torture. The introductory remarks are comical in their diversity. The *Stock Keeper* does it in a few lines, appearing to hold that the least said the soonest mended. Mr. Fred. Gresham, in the *Live Stock Journal*, spreads out his lick-spittle "congratulations to the club" that consistently ignores his fawning praise or impotent blame. The *Shooting Times* gentleman must have been unusually well "treated," and cuddles everybody in return from Spratt's biscuits to Jeyes's purifier. By the bye, I think it is carrying sanitary precaution too far to put the disinfecting fluid into the dogs' drinking dishes. Mr. Gresham would not have been so grateful to Messrs. Jeyes if they had added to his drink a dash of disinfectant. Mr. Rawdon Lee, in the *Field*, is the author of the truthfullest and most accurate account of the show. I am not referring to the dogs; that is another matter. His remarks are worth digesting. Mr. Stephens has improved as manager, and I was pleased to hear high encomium passed upon his civility and attention.

The St. Bernard men got their little share of excitement when Mr. Wyatt put the grand old Bayard behind Valentine in the champion class. I know what a splendid specimen of type Mr. Macdona's dog is, but as I had not the opportunity to see Valentine "down," *i. e.*, off the bench, I hesitate to write in decided tones on the decision. I can only place on record the fact that I did not hear one St. Bernard man express approval; but I must also acknowledge that I did not ask the owner of Valentine what he thought. Bayard is old, and he is not rough but "broken-coated;" still, his benevolent expression and perfect head, markings, and rich orange-tawny color, count for a lot of points. Valentine's coat is no longer, and it is an unsightly Esquimaux color. Merchant Prince made up the ground I foretold he would when I wrote of him at Birmingham; next to him I preferred Laudgrave. All little Smith's "merchants are princes."

Mr. Nicholls added to his reputation as a breeder when he brought forward his noble young dog Lord Nelson, and knocked the breath out of the old winners' bodies; but Newfoundlands are out of fashion. The St. Bernards flirted their admirers away, and just as the fickle fancier began to weary of the monastic fad, the German mastiff poked his nose in, and the life-saving interest continues to remain in the background.

Both Mr. Portier, who bought him at the auction, and the lady who paid a profit on the purchase, must have experienced a glow of satisfaction when Colonel Garnier handed Maximilian the champion prize. I cannot help considering Crown Prince the better mastiff, but I think the curious and secret dealings in connection with his mock sale by auction have richly deserved bad luck. The sour-looking brindle Cardinal I never cared for.

The judge, Col. Garnier, had his own ideas of the nature of those points that constitute perfection in a mastiff. He is probably a good representative of the "old school," but in these days of specialist clubs, it would give more satisfaction to breeders if their dogs were judged by men whose knowledge has been brought "up to date."

The Great Danes made a gaudy show and were unfortunately benched in a dark passage. They are a hot-tempered breed, and I thought several of them might have been chained a few inches shorter. It is not just from a bench inspection to quarrel with the award that put the brindle Sultan II. over Harlequin Nero, but personally I would sooner own the latter and breed from him. The yellow-red Cedric the Saxon literally, almost, walked over his opponents in the open class. It was said in the Palace that he would change hands after the show and the price spoken of was £300. He is well worth it for show purposes. The best bitch of the breed is still Mr. Petrzwalski's huge Mirza, but a prodigious pup named Linda is creeping up to her.

Scotland is looking to her native breeds, and sent along a worthy show of Sir Walter Scott's favorite deerhounds. As coursing is going on all over the country a large entry of greyhounds was not to be expected.

Graphic took his accustomed post of honor; his owner must mean selling when he prices him at £250. A good youngster by him named Paragon was first in the open class, though several pointer men preferred the less fashionably bred Don IX. Revel III. brought her sire's name again to the front; she is beautiful. All through I noticed an exceptional excellence in those classes.

Mr. Doyle is apparently quite impervious to criticism, so it won't hurt his feelings to repeat that his awards were derisively received by those who knew better. The lucky Young Rock III. has been pulled to pieces by his good-natured friends. Both Birket Foster and Prince Fred can beat him. The judge gave least displeasure when he selected the sweet Tam o' Shanter bitch Wild Rose for honors.

The Irish setter puppy class contained an unusually nice lot of pups. There are three breeders, the Rev. R. O'Callaghan, R.N. (who is the best of winners and the worst of losers), Mr. A. Taylor and Mr. C. J. Wade, who ought to, between them, be able to keep this handsome breed of setters prominently before the public. Mr. S. E. Shirley always wins all the money in the wavy-coated retriever classes. I made a note of a grand puppy named Ivy, with such a corkscrew coat.

The collie judge's award kept his confrères in face. The dreadful news soon traversed the show when poor, much-to-be-commiserated Mr. Byron put Rutland, the child of luck, over the magnificent Charlemagne. Cross times indeed when the old champion goes down before the dog of commerce. The judge did not see it but Rockingham was the best in the open class, and behind him were a string of beauties. Matchless, the £100 Birmingham claim, was absurdly passed over in favor of Dahlia, on whom Mr. Byron proceeded to lavish prize after prize. When these bitches come before a proper authority the tale will be less flattering and more truthful. The puppy class was an awful jumble. I got lost in the double numbers and profusion of notices.

I listened a while at the benches of the crooked-legged canines and heard discontented growls over the prizes. The Basset men were complaining that the wrong type had won, but looking at them with an uninitiated eye, I should say if these hounds were meant for work the judging was not so far out.

Taurus had nothing to beat, so he received the £4 for best champion bulldog over 50 pounds. He was catalogued at £45 and has since been sold for £5 less.

Britomartis beat champions Ida and Wheel of Fortune. She was last week purchased by the American fancier, Mr. Livington, for £80. She is a bargain; it is less than she cost Mr. Benjamin before she had won a prize. Rustic King followed up his Birmingham success and won handsomely.

The day was getting drowsy before Mr. Doyle started to pick out his idea of a good fox-terrier. This breed was benched down a narrow gangway, and it was nothing but "Move on, please," whenever one stopped to make notes. Mr. Langdale, in his exhaustive report (*Shooting Times*), speaking of the fox-terrier judges, Messrs. Doyle and Percy Reid, says: "We do not for a moment say that either of these gentlemen, as we heard it said, 'got to the wrong end of the chain,' for we believe that both honestly gave the prizes to the best in their judgment. Others affirm that as both club men and non-club men pay the same fees, etc., they should both be represented in the ring." I can't fathom the meaning of the second sentence; it looks as if the reporter had something weighty to disclose, and has so coated it over that the pill can neither be tasted nor seen. This is a half-hearted way of giving medicine; it should be administered with a firm hand. The wonderful Result vigorously maintains his pride of position, and galloped away with money and cups.

An odd little incident happened in the Dandie classes that I have not seen referred to in the papers. The judge on the first day made an attempt to perform his duty, and got as far as awarding one first prize. He was then interfered with and went home. The following day his work was assigned to Mr. Mellor, who gaily reversed the only decision the advertised judge had been able to make. Now I wonder what does the owner think?

The dear old *Field* generally gets her foot well into it whenever she drops into "leaders." She lately in big periods told the quaking honorary secretaries that they should stand fast by their rules, the rules and nothing but rules. About a week after one of the reporters is permitted to castigate an exhibitor, who acting within his rights, lodged an objection against a successful opponent's dog, on the ground that it "wore a paper collar," I mean a fancy collar, whereas that show's regulation ran that the dogs should be provided with plain collars bearing no signs of identification. The owner of the dog is Mr. Harding Cox, part proprietor of the *Field*, therefore it was in execrable taste to eat their own words on b half of one of themselves. Mr. Cox has written that it is a ridiculous and obsolete rule. So far he and I are of accord, but then he should induce his fellow committeemen of the Kennel Club to insist that those shows which adopt their rules should also accept their regulations. The Kennel Club have long since abandoned that trumpery restriction. Advocates of plain collars can only advance the insulting plea that it prevents the judge seeing to whom the dog belongs. In the first place, is it likely that a man is going down on his knees in the ring to peer out the address, and then so long as exhibitors are allowed to lead in their own dogs, which is the case at all shows, except Birmingham, why should he try to ferret out the address when he can see the proprietor himself at the other end of the chain? Against this we have the fact that the address being on the collar has over and over again been the means of recovering dogs that have escaped from the show or en route. When the champion question was intrusted to a man of such ability as Mr. Percy Reid there was no difficulty in foretelling that it would end in a bungling braggart business; Mr. Reid has not disappointed his friends. His arrangement scores one for the Kennel Club and one for himself.

This is the mousey deformity dame Kennel Club mountain has produced from her connection with the "bruised reed." "In future a dog must win four first prizes before he is eligible to compete in a champion class, which henceforth shall be called the 'challenge class;' to obtain the title of champion he must then win three prizes in the challenge class, one at least of these three being at the Kennel Club's own show."

This selfish, commercial, and partial scheme is similar in design to a biscuit firm offering a prize to the best dog fed on "our biscuits."

A querist writes to the *Stock-Keeper* asking the editor "who appoints the Kennel Club's judges?" Come now, that is not a pertinent inquiry! One should as soon ask a man who appoints his washerwoman, surely he has a right to give it out where he expects to get it best and cheapest done.

At Mr. Harding Cox's fox-terrier sale I am informed that the majority of the lots was withdrawn. This method is getting too frequent and savors of a trick. It seems as if famous dogs are only put up as "a draw." There is nothing dishonorable about it but it is not absolutely straightforward.

The price that Mr. J. F. Smith, the owner of Save and Leonard, paid the Rev. Arthur Carter for his toweringly grand young dog Plinlimmon has not yet transpired, but it is currently reported that the cash was there, and about £400. The priests of the day have found a more profitable employment for their heavy time than their shorn ancestors, who passed it in severe and secluded meditation, gravely calculating how many angels could stand upon the point of a needle. We should have lost that poetic figure if Goldsmith's lovable village parson, who was

> "passing rich with forty pounds a year,"

had bred the holy dogs of St. Bernard.

There is an unworthy rumor afloat that "Birmingham has caved in to the Kennel Club." I cannot believe it. If this be true, Brum, haul down your colors, turn your facings, muffle your drums, reverse your arms, and march out of the good opinion of LILLIBULERO.

JAN. 27, 1885.

THE NEW DOG SHOW RULES.

[The following criticism was prepared for the *American Kennel Register* by the editor of that publication. Having been crowded out of the *Register*, it is, by request, given place here.—ED. F. AND S.]

WHEN the American Kennel Club was first put in a fair way of being established, those interested in seeing a radical improvement in the method of conducting dog shows were hopeful of the result. If it had not been advisable to make some improvement there was no necessity for a kennel club, and if we are to judge by the improvements outlined in the new code of rules we can only say that with such a meagre result to put before the public the necessity for the club's establishment does not seem very apparent.

The constitution and by-laws are matters concerning the club alone and not the great body of exhibitors, but the latter after a perusal of them cannot fail to note the extremely onerous duties of the treasurer, who according to Clause 3 Article VI. "shall receive the funds of the Association and disburse the same under the direction of the Executive Committee." We have carefully read the copy of the constitution and by-laws, but fail to find that the Association can collect any funds from its members. It is the show rules and regulations that are of the main importance to all supporters of dog shows and we will now proceed to criticise them *a seriatim*.

1. The term dog where used in these rules is general in its application, and includes bitches unless they are otherwise mentioned.

The rule should stop at the comma, as the word "bitch" never occurs in the rules.

2. All dogs entered for competition or exhibition only shall be entered in the name of the *bona fide* owner. Such entries must be identified by name of dog, its age, and, if known, the names of its sire and dam; if the name of a dog which has won a first prize has been changed, its name at the time of winning any and every such prize, and the place thereof, as well as its present name, must be given. If the names of the sire and dam are not known, it may be entered "pedigree unknown."

Instead of "such entries" the rule should read "such entry.' The words "if known" are not necessary, as the final clause covers unknown pedigrees. The word "first" before "prize" had better have been omitted. At the close of the same sentence the words "as well as its present name" are quite unnecessary, as the name is of necessity given in making the entry. In the concluding sentence it is of the utmost necessity that no halfway measures should be permitted in the case of unknown pedigrees, therefore the rule should beyond all doubt read "*must* be entered 'pedigree unknown.'"

2. If a dog shall be entered without being identified, as directed in Rule 2, it shall be disqualified from competition.

This would read better if it was "If a dog *is* entered." The rule is a salutory one, and we would suggest that an officer of each club be instructed to make every objection of this nature just as Mr. S. E. Shirley, of the English Kennel Club is understood to do. To some exhibitors it is very obnoxious to make objections, and it would not unlikely happen that at one and the same show a dog in one class would be disqualified, while another would escape because of the want of an objection.

4. Puppies may compete in grown classes, except in classes where they are specially excluded, and will be judged as if matured.

This should either be cancelled or come to a stop at the first comma. The second division of the rule is unnecessary, because, if a class is made from which they are specially excluded, that of itself settles the business without any rule. The concluding portion of the rule is an absurdity. The meaning of it is that the judge is not to be allowed to exercise his judgment as to the probable development of the puppy. The dog in front of him, whether five months or two years old, is to be supposed by him to have completed its growth. It savors also of instructions to judges on a matter entirely within their province.

5. A dog which has, when a puppy, won a first prize in a puppy class, is not thereby disqualified from competition in a class where first-prize winners are excluded.

A good rule, laboriously worded. "A prize won in a puppy class does not count as a win under the champion rule," is a much simpler and clearer way of putting it.

6. Dogs can be entered for the special prizes when eligible, but they must in all cases be previously entered in their regular class.

Entirely unnecessary. If a rule had been made to the effect that no dog which was eligible could be withdrawn from a special prize competition unless so stated on the entry blank

there would have been some good done. What is requisite just now is to put a stop to an owner with say two first prize winners withdrawing one to let the other get the special. This has been done too much of late. The object of a special is to get the best dog and the A. K. C. should prevent owners setting that desirable object at naught.

7. No dog can be entered for competition in more than one regular class.

The history of this rule is that Mr. Lincoln objected to having to bring a dog from any kennel except the one his entry number called for. He said it would lead to endless confusion at New York. Yet last May the Robins Island Field Trials Club benched their dogs together and not in the regular class order, and when he held his own shows at Washington, Cincinnati and elsewhere he abrogated the rule. It means that if any one has a good puppy he must take his choice between the puppy class and open class, but cannot enter in both. Now there is every reason in the world why it should be just the other way about, and a puppy be entered for both classes if the owner so desires. It is decidedly better for the show, as it means a double fee with no extra expense, and if the puppy is good enough to win in both classes, why deprive the owner of the right to show and the puppy of the credit of winning. It is probable that the delegates who passed this rule supposed there was some merit in it, but there is none, and it should be stricken out.

8. A dog to compete in the champion class must have won three first prizes in open classes at bench shows given under the auspices of clubs, members of this Association. And a dog having won three first prizes at above shows cannot compete in an open class when there is a champion class for its kind, but must compete in such champion class.

9. A dog to compete in the extra champion class must have won two first prizes in the champion classes at shows recognized in Rule 9, but it must have at least two competitors to advance its standing, otherwise it wins the prize alone. A dog having won two first prizes cannot compete in a champion class when there is an extra champion class for its kind, but must compete in such extra champion class.

Much has been written and said about these rules since Major Taylor issued his strange explanation of how they were to be interpreted. Rule 8 may be called the A. K. R. rule because we started the three-first-prize cry and kept it up till it was accepted as definitely settled just as the rule now reads. With regard to Rule 9 it is singular to conceive how any persons possessed of ordinary intelligence could propose or vote for such an anomalous thing as an extra champion. You cannot go above a champion. Rule 9 is a sporting absurdity to begin with and even if other names were substituted for champion and extra champion the rule wants altering altogether. For instance, a dog must win three first prizes before he can get into the champion class, and when there he must wait till another dog qualifies and is shown against him to enable him to get any credit for another win. In other words we must have at least seven shows before a dog can be called a champion, the three he wins and the three his opponent wins, and the one they come together at. We are taking it for granted that the words "but it must have at least two competitors" means "but the winner in a champion class must have at least one opponent to advance its standing." The framer of the rules has apparently got opponents and competitors slightly mixed. In speaking of a competition one says, "How many opponents have you?" or, "How many competitors are there?" The quickest way to amend the rule is to strike it out and stick to the old-fashioned champion. The new English rule is to call the class a challenge class, and after a dog has won so many firsts in that class he is entitled to be called a "champion."

10. A dog affected with mange or other contagious disease shall be disqualified from competition, and *may, at the discretion of the Managers or Superintendent*, be removed from the show. A competent person shall be appointed by the Managers to pass judgment as to the disease of dogs.

There should be no discretion about permitting a dog suffering from any contagious disease to remain in the show. Out with him as soon as the vet. says "mange" or "distemper." In place of the italicised words the single one "must" should be used.

11. In any class where there is one or more dogs entered, the judge shall award the prizes only according to merit, withholding such as his judgment dictates.

What is the judge going to do in a class where there is less than one or more dogs entered? If all in front of the first comma shall be stricken out, and the rule begin with "The jugde shall," that would be exactly what the dog parliament meant, and would make a very neat and proper rule.

12. The decision of the judges will be final in all cases, except where mistake, fraud, misrepresentation or collusion can be shown. In any such case the Managers, or such referee as they may appoint, must decide all cases, and the dog may be rejudged.

13. All disputed questions, except those of merit, in any way connected with the judging, will be referred to and be decided by, the Managers.

14. No question involving the merit of a dog to receive a prize can be brought before, or be determined by, the Managers.

These rules might be classified as the reiteration section. In 12 we read that disputed questions, except merit are to be decided by the Managers or their appointed referee; Rule 13 says that all except those of merit must be decided by the Managers, and Rule 14 says questions of merit cannot be decided by the Managers. Rules 13 and 14 are utterly useless, every point in them being covered by Rule 12.

15. All protests and charges must be made in writing, and be delivered to the Managers or Superintendent as soon as possible after awards are made.

15. The Managers will meet daily to receive complaints, and must decide the same as soon as practicable thereafter during the show.

As has been shown by the "pointer controversy," the rule governing protests is very vague. Taken in conjunction with Rule 16, it would now seem that no decision can be rendered by a club's Managers on any case of fraud, misrepresentation or collusion, unless it is made during the show. This is wrong. A charge of such a nature should be the subject of investigation at any time. Considering that at New York the judging has been kept up till dark on the last day of the show, little time is left for framing, presenting and deciding a protest at that show

17. Any person who misconducts himself or herself, or has misconducted himself or herself in any way in connection with dogs, dog shows, or field trials may, in the discretion of the Managers, be disqualified from exhibition or competition at these shows. Such disqualification shall be recognized by all the members of this Association, and such person can only be reinstated by the club or association disqualifying him or her. The person disqualified may appeal to the Executive Committee

This rule reads like a bill pushed through at the closing session of the Legislature only to meet with the gubernatorial veto. If we start off and say "any person found guilty of misconduct in connection with dogs, dog shows, or field trials, shall be disqualified from exhibition at shows held under these rules" we will get a little nearer what is meant and how it should be said. Where the Governor's veto should come in is over the concluding sections. "Such person can only be reinstated by the club or association disqualifying him or her. The person disqualified may appeal to the Executive Committee." What is the use of his appealing to the executive Committee if the appellate or reinstating court is the one which originally passed sentence; and what is to make the club which passed sentence of expulsion obey the Executive Committee which has no authority in the premises. Some correspondents have supposed that if a club expelled an exhibitor he could get relief from the American Kennel Club, but such is not the case, as each club is autocratic in its rulings on expulsions. It was evidently meant to make the Executive Committee an appellate court, but this has not been done.

18. The Managers or Superintendent shall have the right to exclude or remove any dog from the show for any cause appearing to them to be sufficient.

A necessary rule, intended to prohibit the admission of vicious dogs. It is well to note that this does not apply to declining the entry of an owner, the reason for excluding or removing being apparently retricted to the dog when he is brought to or is in the show.

19. The Managers or Superintendent will use due diligence for the care and safety of all dogs exhibited. Watchmen will be kept on duty day and night, but it must be distinctly understood by all exhibitors that the management will not be responsible for loss or damage to any dog exhibited, whether the result of accident or other cause.

This rule is quite out of place, being a local or individual regulation only.

20. It is desired that with each entry the exhibitor will state the price for which he will sell his dog. A prohibitory price will be permitted. All transactions must be between the owner or his representative and the purchaser. The Managers or Superintendent, unless requested, will not interfere nor assume any responsibility in the matter.

Here we must go into the reason for this being worded as it is. At the Westminster K. C. dog show of 1882, Mr. Jester led a setter dog into the ring and as soon as Mr. Mason saw him he asked for the catalogue number. On referring to the catalogue he saw the dog was entered to be sold for $100 and immediately sought Mr. Lincoln, to whom he handed the money and said he claimed No. ——. It transpired, however, that a member of the club had also set covetous eyes on the dog, but made no direct overtures for his purchase till later in the day. On learning that Mr. Lincoln had accepted Mr. Mason's purchase money the club managers ordered Mr. Lincoln to refund the cash, and later on Mr. Jester was handed a check for the amount. Mr. Mason at one time threatened to invoke the law to protect his rights, but a subsequent closer inspection of the dog decided him to relinquish his claim. To prevent future difficulty, in place of saying that bids or claims must be made through the Superintendent, we now have no responsible person. There can be no question that the dogs are under the control of the Managers, indeed the Westminster Club at one show (if we mistake not it was the very one at which the setter trouble took place) defied the sheriff's right to attach and take away some dogs then on exhibition until the closing hour on the fourth day. There is no reason why all clubs in the country should be restricted in this manner simply because the Westminster Kennel Club made the rule read that way. It is a matter of equity which each club may well be left to settle for itself.

21. An entry fee of.....will be charged for each dog entered, and it must in all cases accompany the entry. It includes care and feed for dogs during the exhibition.

22. All entries must be made on blanks furnished by the Superintendent, and can be had on application at his office.

23. The entries close on .....and as soon thereafter as practicable each exhibitor will receive a ticket of identification, and a numbered tag corresponding with the stall number of his dog. When the dog is brought to the exhibition hall the tag must be attached to the collar, and the person accompanying the dog must show his ticket of identification before the animal will be received. Therefore, exhibitors are requested not to lose their tags, nor to put them on the dogs, when practicable, until just before presenting them at the door. In case of dogs coming by express, the tags must be firmly nailed to the crates.

24. Each exhibitor will receive a ticket of identification for all dogs entered, which must be carefully preserved, as no dog will be permitted to pass out of the building at night until his owner shall deposit $5 and surrender this ticket to the check clerk, both of which will be returned on the return of the dog next morning before 9 o'clock. If prize winners are taken and not returned, the prizes awarded them will be forfeited.

25. No dog will be received unless supplied with a suitable collar and chain.

26. The show will be open from 9 A. M. to 10 P. M. each day.

27. The judging will commence promptly each morning at 10 o'clock, or sooner if practicable, and continue until 1 o'clock, and also from 2 P. M. until 6 P. M. During these hours no dog shall be taken from its stall, not even by its owner, and if any dog is not found in its stall when called for by the judge, the judging will proceed without it. This rule will be rigidly enforced that the judging may not be retarded. Owners are requested to be near their dogs, and when the class is called to bring their animals into the judging ring. In the absence of the owner, attendants will take the dog into the ring.

28. Notice of the awards will be attached to the stalls of the prize winners as soon as practicable after the awards are made.

29. Exhibitors will be furnished with a season ticket free.

30. No dog can be permanently removed from the building except by the consent of the Managers or Superintendent.

31. Dogs shipped by express must be prepaid and have a label stating from whom shipped, and the name of station and express company, that they may be properly returned.

32. Previous prize winnings, pedigrees or other mention, shall not be posted in kennels of prize winning dogs until after their respective classes have been judged.

33. Each member of the Association shall appoint their judges, arrange prize lists, form of catalogues, assume their own financial responsibility and arrange such other details as may properly come under its individual management.

34. Other rules and regulations not inconsistent with the constitution and by-laws may be adopted by the members of this Association.

Every one of these should be under the head of local regulations. Take, for instance, Rule 21. Suppose Boston chose to impose a tax of $1 on each dog sent to the show in addition to $2 for entry, so as not to be heavy on people entering who might not be able to send their dogs. Why should Boston not do that? Rules 23, 24 and 25 are particularly out of place as rules of an association; the latter is also indefinite. Rule 26 is purely a matter of local convenience. Rule 27 has already been altered by New Haven. Why? Because it was the old Westminster Club rule to have an hour's intermission at 1 o'clock. Must every show be called upon to stop the judging then? New Haven has taken the common-sense view of its being a purely local regulation and *illegally* altered it.

Why are exhibitors to be furnished a season ticket free? Because New York has always done so. Suppose Montreal should say we will adopt the Birmingham method of giving so many admission tickets in place of one season, why should they not be allowed to do so? All of the rules from 21 to 32 are those which should be left alone by the American Kennel Club, as they are of the kind contemplated by Rule 33. "Each member of the Association shall * * * arrange such other details as may properly come under its individual management." They are of no concern to the associate clubs, are not of the class in which there should be perfect uniformity, and are solely matters of individual management.

If the American Kennel Club committee will take up these rules and knock half of them out and supplant them with rules relative to the breeder, the limit of the time of judging, the necessity of a catalogue and what shall be put in it, they will do some good, but so far the club has only brought itself into ridicule, and its own members are taking the law into their own hands.

THE GREYHOUND CUP.

Editor Forest and Stream:

In reply to Dr. Van Hummel's very fair offer of a few issues ago, I will state that I have already offered the special for the best greyhound to the New England Kennel Club, and that they have accepted it, and that I will not show in Cincinnati because of the impossibility of my being there, and because of the difficulty there would be in deciding on a judge. Neither will I go to Denver and run my dogs against his on account of the time needed, and also because my dogs are not used to the country or the hares.

In conclusion will say that I shall show at New Haven, Boston and New York, and if Dr. Van Hummel will take the trouble to send his dog on, I will offer a cup at either show he may choose in order that it may be proved who has the best greyhound. H. W. Smith.

Worcester, Mass., Feb. 15.

LIVERPOOL DOG SHOW.

[From our regular correspondent.]

The fifth annual Liverpool dog show was held on Jan. 28 and 29, as usual, in the North Haymarket, Liverpool, Eng., with a total entry of about 900, which is the largest the committee have had, and they deserve to be congratulated for having obtained such a large entry, with, we may say, no support from any of the specialist clubs, having, we understand, declined to accept any specials which were not offered for public competition. We wish every committee would act accordingly, we would then either have the specialist clubs working for the improvement of their respective breeds or else we would have no specialist clubs at all. This year, for the first time the show was held under Kennel Club rules. The judges were Messrs. A. B. Bailey, W. W. Thompson, I. S. Skidmore, I. Mawdsley, E. M. Southwell, H. N. Watson and P. Eden.

The first class was the champion St. Bernards with two entries, but only one put in an appearance, Bayard, who also won the cup. Landgrave, vhc., is a good-bodied, upstanding, red and white with a short, square face. Duke, hc., by Bayard, almost white, is small and smooth-coated. Heber, hc., is good in body but deficient in head. First, Nero III., was reported upon here last year, when he was vhc. reserve. As we expected then, he has greatly improved and was shown in the best of condition. He is a very fine upstanding dog, with good color and coat, he carries his tail rather high, and although he has a fair good head it is not the noble head of Bayard. Peter the Great, hc., full brother of a younger litter to Plinlimmon, is a remarkably fine dog and one we prefer to his celebrated brother, were he good in quarter, but we are sorry to say he is almost a cripple behind. Storm King, second, and Pilgrim, third, are well-known and have often been reported upon. Thetis, the winner in the bitch class, is a fine large bitch of good color; she stands well on her legs and is of a good type but too curly in coat. Blanca is small in size and large in ear. Moira, smooth-coated, shows plenty of character. The winning puppy was long and dished in face, also large in ear, but a good, large, well-grown youngster; we preferred second to first as being the most typical of the two, both being out of one litter and by Cadwallader.

Champion mastiffs showed only one, The Prince, who also won a special cup. He was looking well, and has improved much since we saw him at Edinburgh. In the open dog class the quality was not really good; the winner is a fair, good, typical dog. He was not shown in the condition he might be; he was second here last year. Chloe, second in bitches, is small, but typical; she shows age, her daughter, Lady Blanche, by Crown Prince, winning first.

In Newfoundlands, Black Prince won, although he was shedding his coat, and not in the bloom we have seen him. Second and third were too curly. We preferred Leo V. only for his weak pasterns.

In Great Danes the winner is small but full of quality, while the second was large and coarse.

In deerhounds, Chieftain, well known, won by a long way; he also won the special cup.

In curly retrievers we think Jet II. pressed the winner very closely.

In wavy-coated retrievers, Ruth, looking well, but not carrying as good a coat as the winner, only got second, yet we preferred her, as the winner, in our opinion, was too fine, and weak in head and muzzle.

In pointer dogs, Ponto, wearing well, won, with a very good one second, except that he is rather light in muzzle. Third has rather large ears, which are set on high; this takes away from his general character. The winner in the bitch class was small but typical, and showed quality.

Irish setters were a fair good class, we fancied it a close run between Nellie and Count, both looking well, Mate, the Palace winner, coming third. The English setters were a strong class, Young Rock winning, and as he is leggy and light about his kidneys, we consider him very lucky. Tycoon is rather large in ear, and Laverack Chief looked seedy. We think Slap Bang, vhc., very lucky to get so much in the company he was in, Emperor Ned, hc., being in our opinion much better in every respect. In bitches, Wild Rose won first and cup, and correctly so. She is a setter proper, and in our opinion the best setter in the show; however, she could have done on this occasion with a little more coat.

Spaniels were small classes, and the majority of them we have often reported upon; as usual, Solus winning first and cup.

In champion collies first went to Eclipse, well known, and looking as fit as we have seen him for some time. In open dogs first and cup went to Young Cocksie, a black and white whose ears might be better; his tail is carried too high, and his hindlegs quite too straight. However, he was in grand form, carrying plenty of coat and showing lots of quality. Rockingham, second, is much better in ear, better in quarters, yet neither so good in body or coat. Northampton, a good black and tan, with plenty of coat and good bone, yet not quite up to the present ideas of collie character. The Palace winner was entered but did not turn up. Langley, hc., we fancied much; he is good in head and ears, with plenty of coat of the correct texture, but he is rather fine in bone. Our old favorite Sandy was only hc., and his condition was such that we consider him fortunate to get noticed at all. In the bitch class first, second and third were taken by three young ones, Matchless, Dahlia and Peerless, who held the same position in the bitch puppy class. Matchless was rather improved here upon her Palace form, and won easily, while Dahlia, the Palace winner, was pretty closely pressed by Peerless. In dog puppies first and third were in the dog class; second and reserve are both from the same kennel, and although not of the same litter resemble each other much, both being good in coat with good collie head; also much the same yellow color, the reserved number being the lighter of the two.

In champion fox-terriers first went to the wire-haired Pulborough Jumbo, whose pedigree is unknown, while his age is one year and eight months. He is a very nice typical terrier, with black and tan head and a better coat than the majority of the present so-called wire-haired fox-terriers. In champion bitches first went to Pegotty. We preferred Richmond Patchwork, but we must admit it is only a matter of opinion, both being really good ones. In open dogs Hampton Toby, third, is a good, well-made little dog, rather dish-faced. Hardy Joe, vhc., is rather strong in head. Raby Cornet, second, is a good young one not furnished. First and cup went to Fullwood Spark; he has good bone and is well made, with good coat and character, but he might be finer in skull. In bitches Winsome Nell, third, is a good sort, with heavy dark markings. Douglas Tickle, vhc., is another good one. Lytham Gem, first, is about the best we have seen for a long while, and as wicked as handsome. Richmond Myrtle, second, is another good sort; if anything she is too fine before the eye. Green Sage, fourth, is too fine in coat.

Irish terriers had two classes containing good quality. Buster, first, is rather small in face. Playboy, second, ought to have been first; he has good feet, legs and shoulders and lots of style. Third went to Gripper. Were it not for his color commencing to go, he is, we think, better than ever. In bitches, we thought the first and cup winner should only have been about vhc., certainly not more. Poppy, second prize, and Gail, third, are both well known; the former was here out of coat, while the latter had all her coat and is just commencing to shed it. Norah Tatters, vhc.; we saw here for the first time; we preferred her to the winner.

The bulldogs were a very moderate collection, first and second being a long way ahead.

Mr Howarth won first and second in bull-terriers, with Max Marx and Silvio. They are both well-known. In Dandie Dinmonts, first went to Jennie Deans, well known. Tiger II. pressed the winner very closely; he was shown in good coat,

not like the majority, half in and half out, which always impress one with an idea of trimming. In Bedlingtons, the first is small, of good type, but deficient in coat. The second is also good of size and style, while the third, the well-known Bishop, is too large. We think Choker should have been mentioned. Airedales were a good class and correctly judged. We always fancied Fritz, owing to his size, as the best Airedale dog we have ever seen. Venus III., second prize, is another good one, but on the large side for a bitch. Dundee was a long way ahead of anything in Scotch terriers. In Skye terriers, first went to a good specimen of the prick-eared variety, while second fell to a rather small-faced, but good-coated drop-ear.

In pugs Mrs. Booth won first and special cup with Boffin who we never saw look better.

In toy terriers first and second went to Mrs. Troughear's two Yorkshires. There was a small class of black and tans, Burke winning and Robin Hood a good second. Gilda, third, is too large.

In the any other variety class, over 7 and under 30 pounds, first went to the white English terrier North Star, and second to the Blenheim Earl of Chester, reported on at Birmingham; third to an old-fashioned wire-haired terrier. In the variety class over 30 pounds, first went to a bloodhound, second to a German mastiff, while third went to a black curly poodle.

The sporting puppy class had thirty-three entries and the whole class received be. First went to a very promising deerhound puppy by Chieftain, second to a small, but promising English setter bitch, third to a wavy retriever, too fine in muzzle. The non-sporting puppies had twenty-two entries, but the quality was not equal to the sporting division. Following is a list of the principal

AWARDS.

ST. BERNARDS.—CHAMPION—1st and cup, C. Macdona (Bayard).—OPEN—*Dogs:* 1st, H. B. Wood (Nero III.); 2d, W. J. Orwin (Storm King); 3d, W. G. Marshall (Pilgrim). *Bitches:* 1st, Dr. W. T. Sheppard (Thetis); 2d and cup, J. Woodward (Blanca); 3d, J. C. Colam (Moira). *Puppies:* 1st, Misses Pepper (Cervin); 2d, G. N. Hallewell (Queen Jura); 3d, J. W. Waterhouse (Betona).

MASTIFFS.—CHAMPION—1st, J. Royle (The Prince).—OPEN—*Dogs:* 1st, W. Waddington (Baron of Rossendale); 2d, D. L. Buchanan (Spartacus); 3d, E. D. Tyrer (Surajah). *Bitches:* 1st, C. R. Leach (Lady Blanch); 2d, R. H. Leach (Chloe); 3d, R. Alston (Dignity).

NEWFOUNDLANDS—1st, Miss A. Mansfield (The Black Prince); 2d, M. Steele (Sea King); 3d, C. Wilkinson (Leo).

GREAT DANES OR BOARHOUNDS.—1st, A. Keizer (Fraulein Lena); 2d, K. Hughes (Bosco).

DEERHOUNDS.—1st, H. C. Joplin (Chieftain); 2d, R. H. Wright (Old Bevis); 3d. Lord A. Cecil (Bruce).

GREYHOUNDS.—1st, H. F. de Trafford (Telephone); 2d, R. C. Howorth (Duchess of Albany); 3d, H. C. Joplin (County Member).

RETRIEVERS.—CURLY-COATED—1st, J. Freme (Young King Koffee); 2d, G. Culley (Jet II.); 3d, Capt. R. A. Herbert (Gyp).—WAVY-COATED—1st, Lieut.-Col. H. Platt (Pride); 2d, O. Silcock (Ruth); 3d, Rev. W. Sergeantson (Chelmer).

POINTERS.—*Dogs:* 1st, J. E. Crofts (Ponto); 2d, H. F. de Trafford (Don Pedro); 3d, R. S. Aslin and H. Bowman (Duke X). *Bitches:* 1st, Lieut.-Col. H. C. Legh (Devon Doll); 2d, J. E. Crofts (Princess Roseleaf); 3d, R. F. Smith (Sparkle).

SETTERS.—IRISH—1st and 3d, H. M. Wilson (Nellie and Mate); 2d, E. S. Snow (Count). ANY OTHER VARIETY.—*Dogs:* 1st, J. Freme (Young Rock); 2d and 3d, Lieut.-Col. H. Platt (Tycoon and Laverack Chief). *Bitches:* 1st and 2d, Lieut.-Col. H. Platt (Wild Rose and Belle of Ravensbarrow); 3d, R. Chapman (Heather Beauty).

SPANIELS.—BLACK—1st, J. Royle (Solus); 2d, J. Freme (Kaffir); 3d, W. R. Bryden (Negro). SUSSEX OR OTHER LIVER—1st, J. G. Gamon (Lady Bess); 2d, G. T. Miller (Lord Randolph); 3d, J. Hargreaves (Vita). ANY OTHER VARIETY.—1st, Capt. S. M. Thomas (Lass o' Devon); 2d, J. Royle (Zuess); 3d, H. H. Holmes (Tower). SPORTING.—J. G. Gamon (Lo La); 2d, T. Prescott (Billy); 3d, Mrs. J. Stevenson (Kaffir King).

BASSET HOUNDS.—CHAMPION—1st and cup, F. W. Blain (Bourbon).—OPEN CLASSES.—*Dogs:* 1st, cup and third, F. W. Blain (Bertrand and Bavard); 2d, H. Jones (Judge). *Bitches:* 1st, G. R. Krehl (Artemis); 2d and 3d, F. W. Blain (Bertille and Bretonne).

DACHSHUNDE.—*Dogs:* 1st, H. A. Walker (Maximus); 2d, W. E. Litt (Olympian); 3d, H. Jones (Jocza). *Bitches:* 1st, H. Jones (Dina); 2d, J. Henderson-Bulcock (Daphne); 3d, W. A. Benson (Rosa).

COLLIES.—CHAMPIONS—1st and cup, G. R. Krehl (Eclipse).—OPEN—ROUGH-COATED—*Dogs:* 1st and cup, T. P. Lyon (Young Cockie); 2d, S. Boddington (Rockingham); 3d, S. Osborn (Romulus). *Bitches:* 1st and 3d, J. Pirie (Matchless and Peerless); 2d, S. Boddington (Dahlia).—SMOOTH-COATED—1st, G. Raper (Rector); 2d, W. H. Beach (Baronet); 3d, C. Reeling (Buttercup).—PUPPIES—*Dogs:* 1st, S. Boddington (Rockingham); 2d, J. J. Stewart (Clifton Hero); 3d, T. H. Stretch (Northampton, late Byron). *Bitches:* 1st and 3d, J. Pirie (Matchless and Peerless); 2d, S. Boddington (Dahlia).—LOCAL CLASSES—*Dogs:* 1st, 3d and cup, J. J. Stewart (Clifton Hero and Noble); 2d, T. H. Stretch (Northampton, late Byron). *Bitches:* 1st and 3d, R. Wright (Orrell Lass and Holly); 2d, J. J. Stewart (Pansy).

FOX-TERRIERS.—CHAMPION—*Dogs:* 1st, G. F. Nutt (Pulborough Jumbo). *Bitches:* 1st and cup, J. J Stott (Pegotty).—OPEN—SMOOTH-COATED—*Dogs:* 1st and cup, J. J. Stott (Fulwood Spark); 2d, G. Raper (Raby Cornet); 3d, I. Everitt (Hapton Toby): 4th, Court & Johnstone (Denman Spot). *Bitches:* 1st, D. Hedges (Lytham Gem); 2d, G. Raper (Richmond Myrtle); 3d, A. Jordan (Winsome Nell); 4th, J. & W. Birch (Greengage).—WIRE-HAIRED—1st and 3d, W. Wilson (Tim Turpin and The Luck); 2d, W. A. Dixon (Finish); 4th, D. H. Owen (Hawthorn).—SMOOTH OR WIRE-HAIRED—*Dogs:* 1st, W. Wilson (Tim Turpin); 2d, L. P. C. Astley (Nero); 3d, J. J. Pim (Paradox); 4th, C. H. Mathews (Mack). *Bitches:* 1st, G. Raper (Richmond Thimble); 2d, W. Wilson (Lorna Doone); 3d, P. Guy (Smithdown Daisy); 4th, A. Ford (Dreadful Girl).—PUPPIES—*Dogs:* 1st, G. Raper (Raby Cornet); 2d, J. J. Pim (Paradox); 3d, A. Lawton (Edgehill Tom); 4th, J. O. Kay (Dane Rebel). *Bitches:* 1st and cup, H. H. Beaumont (Lady Mask); 2d, J. J. Pim (Poem); 3d, G. Raper (Richmond Thimble); 4th, P. P. B. Taylor (Lancashire Lass).—LOCAL—*Dogs:* 1st, A. B. Vines (Swinton Spot); 2d, H. King (Lytham Member); 3d, J. Moorcraft (Aughton Lad); 4th, J. Anderson (Gripper III.). *Bitches:* 1st, A. Jordan (Winsome Nell); 2d, F. G. Middleton (Fun III.); 3d, P. Guy (Smithdown Daisy); 4th, J. Smith (Miss Dot). *Puppies:* 1st, H. H. Beaumont (Lady Mask); 2d, Bellin & Bland (Rustic Flash); 3d, G. Gorst (Turpin); 4th, A. Lawton (Edgehill Tom).

IRISH TERRIERS.—*Dogs:* 1st, C. H. Backhouse (Buster); 2d, H. A. Graves (Playboy); 3d, W. Milne, Jr. (Gripper). *Bitches:* 1st, cup and 2d, C. M. Nicholson (Poppy II. and Poppy); 3d, H. A. Graves (Gaily).

BULLDOGS.—1st, R. C. Haworth (Julius Cæsar); 2d, J. Peace (Nero); 3d, Capt. W. W. Mackie (Jem Mace).

BULL-TERRIERS.—1st, cup and 2d, R. C. Haworth (Max Marx and Silvio); 3d, Mrs. M. J. Langton (Demon).

DANDIE DINMONTS.—1st and 3d, H. F. de Trafford (Jennie Deans and Roderick); equal 2d, T. F. Slater (Tiger II.); S. W. Doyle (Beadigo).

TERRIERS.—BEDLINGTON—1st, D. Ross (Statesman); 2d, J. A. Baty (The Heiress); 3d, J. A. Baty (The Bishop). AIREDALE.—1st and 3d, W. Tatham (Fritz and Spriggs); 2d, Walker (Venus III.). SCOTCH.—1st and cup, Capt. W. W. Mackie (Dundee); 2d, H. F. de Trafford (Vixen); 3d, Lord A. Cecil (Janet). SKYE.—1st, J. Campbell (Pearl); 2d, J. H. Railton (Ike); 3d, E. Goas (Brandy). TOY.—1st and 2d, Mrs. M. A. Troughear (Conqueror and Belle of Bury); 3d, Miss H. Crowley (Gipsy.)

PUGS.—1st and cup, Mrs. L. Booth (Boffin); 2d, C. Houlker (Loris); 3d, J. W. Wood (Lord Nelson).

BLACK AND TAN TERRIERS.—1st and cup, J. Royle (Burke); 2d, W. Joyner (Robin Hood); 3d, J. R. Greaves (Gilda, late Nelly).

ANY OTHER VARIETY.—ABOVE 7LBS. AND NOT EXCEEDING 30LBS.—1st, Mrs. M. A. Troughear (North Star); 2d, Mrs. L. Booth (Earl of Chester); 3d, J. T. Preece (Old Adam). ABOVE 30LBS.—1st, R. H. Wright (Hector); 2d, J. Peace (Bob); 3d, W. H. Carruthers (Little Sam).

PUPPIES.—SPORTING—1st and cup, H. C. Joplin (Caledonia); 2d, G. Potter (Queen Elsie); 3d, H. F. De Trafford (Zero). NON-SPORTING.—L. R. C. Haworth (Marshbrook Ruby); 2d, H. F. De Trafford (Sir Walter Scott); 3d, C. Houlker (Loris);

THE NEW YORK DOG SHOW.—The Westminster Kennel Club have written to Mr. Hugh Dalziel to act as judge. It will be remembered that Mr. Dalziel very acceptably filled the position at the W. K. C. show of 1880, and it is to be hoped that the club will be so fortunate as to again secure his services. We know him to be an excellent judge and that his integrity is above suspicion.

NEW HAVEN DOG SHOW.

Editor Forest and Stream:

Since printing the premium list we have completed our list of judges, which we give below:

John Davidson, Monroe, Mich.—Pointers, foxhounds, deerhounds, greyhounds and beagles.

Charles H. Mason, New York.—Mastiffs, dachshunde, bullterriers, fox-terriers and all other terrier classes, collies, Italian greyhounds, pugs and poodles.

James Watson, Philadelphia, Pa.—Newfoundlands, St. Bernards, bulldogs, field spaniels, cockers, King Charles, Blenheim, toy terriers and miscellaneous.

C. S. Westcott, Philadelphia, Pa.—English setters, Irish setters, and black and tan setters.

Special prizes to the value of $500 will be offered either in cash or otherwise.

Please be so good as to correct the words in our premium list "8 P. M." to "8 A. M." on Tuesday, March 17, for the reception of dogs at the New Haven show.

The management state with pleasure that Dr. H. Clay Glover, of New York, the well-known veterinary, will look after the health and condition of all dogs exhibited.

E. S. PORTER, Secretary.

NEW HAVEN, 781 Chapel Street, Feb. 14, 1885.

Editor Forest and Stream:

I should like to say a few words in explanation of the changes in the list of judges as originally announced in the premium list of the New Haven show. The committee having the selection of the judges in charge received many suggestions from prominent exhibitors and breeders as to who would fill the positions with ability and fairness. Prominent among the names mentioned were those of Mr. Chas. H. Mason, Mr. Jas. Watson, Mr. Jas. Mortimer, Mr. C. S. Westcott, Mr. J. F. Kirk and Mr. John Davidson. Mr. Davidson being in Hazen, Ark., on a hunting trip, it was some time before he could be communicated with, but at length he was heard from and his acceptance of the position received. Messrs. Watson and Westcott being in Philadelphia were easily reached, and promptly accepted.

Mr. Chas. H. Mason (who by the way was the first gentleman thought of in connection with judging by the committee) would have been asked first had it not been for the fact that he was intending to show his dogs, and these the club were most anxious to have exhibited. Mr. Mortimer was assigned certain classes and was communicated with by telegraph, but misunderstood the necessity of a reply by the same mode of communication, and wrote that he could not act as the classes did not suit him. In the mean time, no reply being received from him to the dispatch, which stated that silence on his part would be taken as consent, slips were inserted in the premium list having his name as one of the judges. When Mr. Mortimer's letter was received Mr. Kirk was thought of and asked, but he replied that owing to his inability to attend he would be obliged to decline. The committee then asked Mr. Mason to act, which this gentleman has kindly consented to do, giving up entering his dogs for competition and placing his services to the club. The classes as now finally arranged the club feel sure will prove satisfactory to exhibitors and breeders. Since Mr. Mason's appointment the club has received many congratulations on the wisdom of its course.

The cause of the delay in getting out premium lists, etc., and in having to make all preliminary arrangements for the show in haste was the difficulty in securing the lease of the Armory. This has been arranged at last, and everything points to a most successful show, if the number of entries received at this early date and the number of applications for blanks amount to anything. There seems to be a mistaken idea of the club's relations with Mr. Mortimer. Mr. Mortimer's action was perfectly right if the classes were unsatisfactory to him, and the only cause of his announcement as judge was that he did not reply by telegraph.

J. B. ROBERTSON, JR., President N. H. K. C.

BOSTON DOG SHOW.

Editor Forest and Stream:

Matters are progressing splendidly with us, in fact the outlook both for the club and our bench show is very flattering. This is our first year, but it seems as though we had been in the business all our lives, everything is running so smoothly. I had a letter from one of the prominent clubs to-day saying, "Don't be downhearted if you don't receive twenty-five entries till the week before the show." This makes me smile, for I have received application for space for 150 dogs, and our premium list is still in the printer's hands, so that I feel in my bones that we shall have a splendid show. One thing alone troubles me, and that is owners of the best stock delay entries; and in case we should have to refuse entries, it might throw out dogs which would be missed at the show; our rule is first come first served. Our entries close March 21. Our judges are: C. S. Westcott, setters; G. N. Appold, pointers; J. R. Pierson, greyhounds and deerhounds; J. F. Kirk, spaniels and some terrier classes; Jas. Watson, foxhounds, beagles and Basset hounds; R. H. Barlow, bull-terriers, fox-terriers and pugs; E. Dudley, mastiffs, St. Bernards and Newfoundlands; A. S. Apgar, collies.

Next week I will send you an authentic list of judges and their classes. I cannot do so to-day, for the reason that the classes assigned to Messrs. Kirk and Watson are not yet arranged. J. A. NICKERSON, Secretary.

BOSTON, Mass., Feb. 13.

WHAT TREASURE DID.—Lancaster, Mass., Feb. 12.—*Editor Forest and Stream:* In reply to your reporter's comments upon Treasure at the Fanciers' show, I beg to state that he was not entered in the champion class, but in the open, where he belonged. By "recognized" American shows, I supposed large and important ones were meant, as distinguished from small and local. Hence Treasure had a right to compete for the special, never having had the good fortune to win three prizes at large important shows during the year of his bench show career. He has always been entered according to the requirements of the rules and regulations of the various clubs and societies, as can readily be proved by documentary evidence if desired. Hence the slur, "When there is a champion prize in view Treasure competes for it; whereas, on other occasions, he is a novice," is undeserved. Criticism, *per se*, no matter how severe, is valuable to breeders. Comments suggesting imputations upon the honesty of their entries can hardly fail to lead them in their turn to doubt the honesty or knowledge of the critic. Permit me to give Treasure's record for the information of your reporter: January, 1884, at Meriden, puppy class, first and special; at Taunton, puppy class, first and special, with Young Toby; March, at Toronto (where he was overlooked and not shown until after the pugs had been judged, and the reporters gone with their notes), vhc.; April, at Cleveland, open class, first and special; September, at Manchester, New England Fair, champion; October, at Stafford, champion and special; at Philadelphia, National Breeders' show, hc.; at New York, hc.; December, at Taunton, champion and special. In regard to the October shows, it is interesting to note that at the Philadelphia Kennel Club show, Nig won first and Tu-Tu third; at the National Breeders' show, Nig won second, and at New York was considered worth c. only, while Tu-Tu came in for first finally. Treasure was absent from the Philadelphia Kennel Club show, and had to be content with hc. at the National Breeders' show. At New York, great was his astonishment to receive the same award, and find Nig one letter behind him, while little Tu-Tu headed the list of victors. *Quot judices, tot sententiæ!* Your reporter calls Treasure too large; may his size excuse him for occupying so much of your valuable space.—CHEQUASSET.

[Our correspondent incloses to us the following communication from the secretary of the New York Fanciers' Club: "New York, Feb. 13, 1885. In reply to your favor of 12th inst. will say that your pugs were entered in Class H., one for bitches, the other for dogs. Yours, &c., CHAS. R. HARKER." From this it appears that Treasure, under no circumstances, could have been entitled to the champion prize, not being entered for it. Rule 5 of those governing the judgments of dogs in this show reads, "A dog that has won three first prizes in shows that have a record of 350 entries, may compete in the champion class and is excluded from the open class." In the judge's book for champion Class (class G.) No. 1,001 is marked first, and in the catalogue we find under the heading Chequasset Kennels: "1,001, pug dog named Treasure, for sale, $200." Treasure, therefore, did take the champion prize for best pug. To this he was not entitled. He did not win in the open class, for Gildersleeve's dog Dude, 1,032, took first in that class. As Treasure did not compete in Class H, the open class for pugs, as the record shows, it is difficult to see how he could have won the prize offered for the best dog in that class. His having the prize awarded him in Class G, as was done by the judge, and Class G being for dogs that had won three first prizes at shows having a record of 350 entries, Treasure was barred from competing for a prize offered for the best pug that had not won three prizes at recognized American shows. We presume three first prizes was intended, for as is seen above Treasure has won more than three prizes. The facts thus detailed all go to show the importance of exercising the greatest care in matters pertaining to entries.]

THE POISON FIEND.—Westfield, N. J., Feb. 9.—*Editor Forest and Stream:* My good old setter dog Dash was stricken down by the hand of the poison fiend Sunday evening. He was not a field trial winner, no bench show winnings could be boast of; but an honest, noble fellow, whom I've had many a pleasant day's shoot over, and it was hard to have him die like this. It would be some satisfaction could I bring sufficient evidence to prove my suspicions of who his murderer was, but unfortunately this cannot be done, so the guilty wretch must go unpunished. This is not the first instance of the kind in this town, many of our local sportsmen have had their dogs poisoned, and suspicions point strongly to one crabbed old wretch, who some day will be made to answer for his dastardly deeds.—WM. H. R. DUBOIS.

NEW ORLEANS DOG SHOW.—A special dispatch from New Orleans, Feb. 16, says: "The dog show to be held here commencing March 5, will continue five days only. The American, Southern and Texas Express Companies will return dogs that have passed over their routes free. The judges appointed are Major J. M. Taylor for setters and pointers, Col. Skinner for deerhounds, greyhounds and foxhounds, Mr. J. F. Kirk for the remaining classes. There will be a fine list of special prizes.—G. Y. JOHNSON, Sup't Dep't Agriculture."

MR. MASON'S CHECK.—Several weeks since Mr. C. H. Mason concluded a reply to "Saxon" with the statement that he inclosed a check for $100. Through inadvertence we omitted at the time to speak of this matter. We may say now that we have returned this check to Mr. Mason, with the statement that the FOREST AND STREAM is not in the habit of holding stakes or forfeit money, and cannot do so for any one.

CHICAGO DOG SHOW.—*Editor Forest and Stream:* The Illinois Kennel Club have decided on the dates June 2, 3, 4 and 5, 1885, for their bench show.—JOHN H. NAYLOR, Sec'y (3,182 Archer avenue, Chicago, Ill.).

MISS ROMP AND HOPS.—In notice (Feb. 5) of pointer importations by Mr. Edward Dexter, for Miss Kemp read Miss Romp, and for Hope read Hops.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Ross and Rem. By Charles S. Davol, Warren, R. I., for white, black and tan beagle dogs, whelped Dec. 10, 1884, by Ringwood (Ranter—Beauty) out of Thorn (Victor—Lucy).

Jem Wind'em. By O. D. Thees, New York, for blue belton English setter dog, whelped May 15, 1884 (Count Noble—Lady May).

Pius. By C. N. Ransom, Buffalo, N. Y., for orange and white, with black markings, rough-coated St. Bernard dog, whelped November, 1884 (Courage II.—Bellina).

Punch. By R. S. Iredell, Akron, O., for black cocker spaniel dog, whelped Aug. 13, 1884, by Brag out of Rosa Bonheur.

Lady Nevison. By Harry L. Hollis, Wellsville, N. Y., for fawn mastiff bitch, whelped March 4, 1884, by champion Nevison (Gurth—Juno) out of Brenda (A.K.R. 1139).

Gaylad. By Geo. B. Inches, Boston, Mass., for white, black and tan fox-terrier dog, whelped Aug. 3, 1884, by Mixture (Spice—Fairy III.) out of Jaunty (Joker—Torment).

Daisy Bird. By Scotch Collie Kennel Club, Stepney, Conn., for liver pointer bitch, whelped July 18, 1884, by Shot (Shot—Bell) out of Bird (Harry—Nell).

Bessie B. By Ravenswood Kennels, Boston, Mass., for lemon and white English setter bitch, whelped July 24, 1884 (Gladstone—Bessie A.).

Bradford. By Charles H. Mason, New York, for white and liver pointer dog, litter brother to Beaufort (A.K.R. 694).

Garryowen Kennel. By Joseph Hayes, Boston, Mass., for his kennel of red Irish setters.

Mina—Antic. John Gould's (Trenton, N. J.) English setter bitch Mina (Calibar—Beauty) to Prof. H. J. Rice's Antic (Prince—Pebble, A.K.R. 43).

Gipsy—Hero II. W. D. Cook's (Milton, Mass.) mastiff bitch Gipsy (Lee's Turk—Baby) to Ashmont Kennels' Hero II. (A.K.R. 545), Dec. 27, 1884.

Lioness—Hero II. John Capen's (Dorchester, Mass.) mastiff bitch Lioness to Ashmont Kennels' Hero II. (A.K.R. 545), Jan. 1.

May—Fritz. Prof. W. C. Sparry's (Hartford, Conn.) pointer bitch May (Sam—Vision) to A. C. Collins's Fritz (A.K.R. 1249), Feb. 9.

BRED.

☞ *See instructions at head of this column.*

Regie—Surry. E. S. Porter's (New Haven, Conn.) mastiff bitch Regie (A.K.R. 1149) to Wm. North's imported Surry, Jan. 21.

Jule—Chalkley D. J. O. Roberts's (West Chester, Pa.) English setter bitch Jule (A.K.R. 2059) to E. K. Bispham's Chalkley D. (A.K.R. 1456), Jan. 2.

Tramp—President. F. Harris's bull-terrier bitch Tramp to E. S. Porter's President (A.K.R. 1208), Jan. 31.

Abbess—Katerfelto. The St. Bernard Kennels' St. Bernard bitch Abbess (A.K.R. 783) to Katerfelto (A.K.R. 784), Dec. 3, 1884.

Clover Fidget—Raby Nailer. The Clovernook Kennels' (New York) fox-terrier bitch Clover Fidget (A.K.R. 2100) to Raby Nailer (Corinthian—Plumber), Dec. 3, 1884.

Surrey Clove—Flippant. The Surrey Kennels' (Ellicott City, Md.) fox-terrier bitch Surrey Clove (A.K.R. 1899) to their Flippant (A.K.R. 538), Dec. 29, 1884.

Little Nellie—President. F. F. Dole's (New Haven, Conn.) bull-terrier bitch Little Nellie to E. S. Porter's President (A.K.R. 1205), Feb 5.

Lill II.—Bannerman. A. C. Krueger's (Wrightsville, Pa.) beagle bitch Lill II. to his Bannerman (A.K.R. 1709), Feb. 2.

Gipsey Queen—Bannerman. C. F. Kent's beagle bitch Gipsey Queen to Bannerman (A.K.R. 1709), Dec. 24, 1884.

Fanny—Watty. Geo. Sanderson's (Moncton, N. B.) imported Sky terrier bitch Fanny to his imported Watty, Feb. 3.

Belle Boyd—Count Noble. Dr. R. I. Hampton's (Athens, Ga.) English setter bitch Belle Boyd (A.K.R. 1237) to Count Noble, Jan. 26.

Lola S.—Joe P. W. L. Steele, Jr.'s (Rockingham, N. C.) English setter bitch Lola S. to T. C. Leak's Gordon setter Joe P.

Phiz—Dutch, Jr. F. B. Rice's (Worcester, Mass.) bull-terrier bitch Phiz to T. R. Varick's Dutch, Jr. (A.K.R. 1887).

Babette—Waldmann II. Wm. Loeffler's (Preston, Minn.) dachshund bitch Babette (Bock—Waldina) to his Waldmann II. (Faust—Flora), Jan. 10.

Crawl—Waldmann II. Wm. Loeffler's (Preston, Minn.) dachshund bitch Crawl (Waldmann—Waldina) to his Waldmann II. (Faust—Flora), Feb. 3.

Diana—Bergmann. Wm. Loeffler's (Preston, Minn.) dachshund bitch Diana (Waldmann II.—Babette) to his imported Bergmann, Jan. 30.

Lina L.—Waldmann II. Chas. Klocke's (Pittsburgh, Pa.) dachshund bitch Lina L. (Bergmann—Gretchen) to Wm. Loeffler's Waldmann II. (Faust—Flora), Jan. 31.

Toodles—Joe. Geo. W. Dixon's (Worcester, Mass.) imported pug bitch Toodles to champion Joe (A.K.R. 925), Feb. 10.

Lady Clyde—Montrose. Scotch Collie Kennel Club's (Stepney, Conn.) collie bitch Lady Clyde (A.K.R. 883) to their Montrose (A.K.R. 891), December, 1884.

Highland Mary—Montrose. Scotch Collie Kennel Club's (Stepney, Conn.) collie bitch Highland Mary (A.K.R. 1572) to their Montrose (A.K.R. 891), Feb. 1.

Dinah II.—Knickerbocker. John Pierrepont's (Brooklyn, N. Y.) pointer bitch Dinah II. (Speck—Dinah) to champion Knickerbocker (A.K.R. 19), Feb. 4.

Fly—Dean. Mr. Sweet's pointer bitch Fly (Dixie—Fan) to Locust Grove Kennels' Dean (Sensation—Daisy Dean), Jan. 22.

Flora—Sam. Locust Grove Kennels' (Manton, R. I.) native setter bitch Flora (Dick—Gipsy) to their Sam (Sam—Smut II.), Jan. 24.

Smut II.—Duke. Locust Grove Kennels' (Manton, R. I.) native setter bitch Smut II. to their Duke (Pete—Fan), Feb. 6.

——*—Dean.* Mr. Heald's pointer bitch —— to Locust Grove Kennels' Dean (Sensation—Daisy Dean, Feb. 14.

Grace—Beaufort. R. E. Westlake's pointer bitch Grace (A.K.R. 1250) to C. H. Mason's Beaufort (A.K.R. 634), Feb. 8.

WHELPS.

Rusk. O. M. Hammond's (Lakeville, Cal.) Chesapeake Bay bitch Rusk (A.K.R. 144), Nov. 1, 1884, number and sex not stated, by C. P. Curtis's Foam (Albert—Rose).

Mistletoe. J. W. Houston's pointer bitch Mistletoe (A.K.R. 1254), Jan. 5, nine (four dogs), by his Bruce II. (A.K.R. 695); all liver and whi e.

Mona. R. J. Sawyer's (Menominee, Mich.) St. Bernard bitch Mona (A.K.R. 1270), Jan. 8, fourteen, two bitches living, by Cantoni (A.K.R. 1362).

Forest Ida. R. McMillan's (Galt, Ont.) English setter bitch Forest Ida (A.K.R. 2054), Dec. 25, 1884, seven (three dogs), by Paris III.

Curley. E. L. Bailey's (Pittsfield, Mass.) Skye terrier Curley (A.K.R. 1907), Jan. 1, four (two dogs), by J. McEnany's Fido.

Bridget. E. S. Porter's (New Haven, Conn.) bull-terrier bitch Birdt, Feb. 4, Mir (one dog), by his President (A.K.R. 1508).

Pigeon. A. C. Krueger's (Wrightsville, Pa.) beagle bitch Pigeon (A.K.R. 1725), Feb. 3, six (two dogs), by his Bannerman (A.K.R. 1709).

Floss. A. C. Krueger's (Wrightsville, Pa.) beagle bitch Floss (A.K.R. 1720), Feb. 11, five (two dogs), by his Bannerman (A.K.R. 1709).

Alma II. Hermitage Kennels' (Passaic, N. J.) St. Bernard bitch Alma II. (A.K.R. 276), Dec. 10, 1884, twelve (five dogs), by Don II. (The Shah—Dewdrop); seven since dead.

Gertie. Hermitage Kennels' (Passaic, N. J.) St. Bernard bitch Gertie (A.K.R. 788), Nov. 28, 1884, four (three dogs), by Bonivard (A.K.R. 361); three since dead.

Madam Juno. Chas. S. Davol's (Warren, R. I.) red Irish setter bitch Madam Juno (A.K.R. 1853), Feb. 12, nine (six dogs), by his Rutledge (A.K.R. 1860); two dogs and one bitch since dead.

Ruby. Kilmarnock Collie Kennels' (Dorchester, Mass.) imported collie bitch Ruby, Feb. 7, nine (five dogs), by champion Rutledge (Wolf—Madge).

Ursula. The Alpine Kennels' (Mount Vernon, N. Y.) St. Bernard bitch Ursula (A.K.R. 26), Jan. 31, four (one dog), by their Carlo (A.K.R. 89).

Zoe. B. M. Stephenson's (La Grange, Tenn.) English setter bitch Zoe (Gladstone—Faun), Feb. 2, seven, by Ben Hill (Druid—Ruby); five black, white and tan, and two lemon and white.

Gipsy Herbert Flint's (Haverhill, Mass.) cocker spaniel bitch Gipsy, Feb. —, four (three dogs), by Ober (A.K.R. 855).

Lady Clyde. Scotch Collie Kennel Club's (Stepney, Conn.) collie bitch Lady Clyde (A.K.R. 883), Feb. 2, seven (three dogs), by their Montrose (A.K.R. 891).

Nellie Dale. Ravenswood Kennels' (Boston, Mass.) English setter bitch Nellie Dale, Jan. 25, nine (three dogs, by Dash III.; all black and white.

May. J. E. Decker's (Newark, N. J.) pointer bitch May, Feb. 7, seven (four dogs), by Dr. A. McCollom's Bon Ton (A.K.R. 1436).

Abbess. The St. Bernard Kennels' St. Bernard bitch Abbess (A.K.R. 783), Feb. 10, eighteen (eleven dogs), by Katerfelto (A.K.R. 789); ten since dead.

SALES.

☞ *See instructions at head of this column.*

Bruce. Mastiff dog (A.K.R. 1763), by John Clay & Son, Westfield, Mass., to F. G. Grimes, Hillsboro, N. H.

Viola. Pointer bitch (A.K.R. 703), by Surrey Kennels, Ellicott City, Md., to J. H. Winslow, Philadelphia, Pa.

Norah. St. Bernard bitch (A.K.R. 790), by Geo. V. Skal, New York, to St. Bernard Kennels, Clifton, S. I.

Captain II. Cocker spaniel dog (A.K.R. 1807), by H. F. Schellhass, Brooklyn, N. Y., to Fred Bollett, same place.

Lavalette. Black, white and tan English setter bitch, 3½yrs. old (Druid—Princess Draco), by Chas. Tucker, Stanton, Tenn., to Pierre Lorillard, New York. Price, $1,500.

Lilac. Collie bitch (A.K.R. 885), by Thos. H. Terry, New York, to E. Levergne, Highland, N. Y.

Criterion. Bull-terrier dog (A.K.R. 1886), by R. & W. Livingston, New York, to Wm. Russel, same place.

Belvoir Jack. Fox-terrier dog (A.K.R. 527), by Surrey Kennels, Ellicott City, Md., to G. H. Stausbury, Franklin, Pa.

Surrey Sam. Fox-terrier dog (A.K.R. 1489), by Surrey Kennels, Ellicott City, Md., to E. Linthicum, same place.

Trix. Fox-terrier bitch (A.K.R. 743), by Surrey Kennels, Ellicott City, Md. to Dr. J. W. Hebb.

Dandy. Pug dog (A.K.R. 1936), by City View Kennels, New Haven, Conn., to D. V. Fuller, Belchertown, Mass.

Lill. White, black and tan beagle bitch, age not given (Warren—Rosey), by Fulton Kennel Club, Canal Fulton, O., to A. C. Krueger, Wrightsville, Pa.

Blue Cap—Lill whelp. Beagle dog puppy, by Fulton Kennel Club, Canal Fulton, O., to A. C. Krueger, Wrightsville, Pa., and resold by him to H. B. Beidler, same place.

Blue Cap. Beagle dog, age and color not given (Blue Cap—Blue Bell), by Fulton Kennel Club, Canal Fulton, O., to A. C. Krueger, Wrightsville, Pa.

Lill II. Beagle bitch, age and color not given (Boxer II.—Lill), by Fulton Kennel Club, Canal Fulton, O., to A. C. Krueger, Wrightsville, Pa.

Maud. Beagle bitch, age and color not given (Racer—Sora), by A. C. Krueger, Wrightsville, Pa., to F. W. Wheaton, Wilkesbarre, Pa.

Rex Rab. Collie dog (A.K.R. 1752), by the Houghton Farm, Mountainville, N. Y., to Wm. A. Stewar , New York.

Frou Frou. Pug bitch, age and pedigree not given, by Geo. Gillivan, West Jefferson, O., to S. S. McClure, New Orleans, La.

Gold Coin. Pug dog, age and pedigree not given, by H. L. Goodman, Auburn Junction, Ill., to Geo. Gillivan, West Jefferson, O.

Rum. Prick-eared Skye terrier dog, whelped Sept. 3, 1884 (Watty—Fanny), by Geo. Sanderson, Moncton, N. B., to C. E. Taylor, same place

Mull. Prick-eared Skye terrier dog, whelped Sept. 3, 1884 (Watty—Fanny), by Geo. Sanderson, Moncton, N. B., to Thos. Fyshe, Halifax, N. S.

Skye. Prick-eared Skye terrier dog, whelped Sept. 3, 1884 (Watty—Fanny), by Geo. Sanderson, Moncton, N. B., to J. S. Mactean, Halifax, N. S.

Count Dan (A.K.R. 1283)—Belle Boyd (A.K.R. 1277) whelps. English setter dogs, whelped Aug. 20, 1884, by Dr. R. I. Hampton, Athens, Ga., one to Wm. Nightingale and two to Albin Oneberg, Rome, Ga.

Young Baroness. Bull-terrier bitch, age not given (Baron—Lurline), by Wm. Hinks, Birmingham, Eng., to T. R. Varick, Worcester, Mass.; she is in whelp to Dutch.

Prince. Mastiff dog, whelped Dec. 10, 1884 (Agrippa, A.K.R. 449—Pride, A.K.R. 1516), by Riverview Kennels, Clinton, Mass., to O. F. Vedder, Schenectady, N. Y.

Grace. Mastiff bitch, whelped Oct. 30, 1884 (Duke of Kent, A.K.R. 1507—Duchess, A.K.R. 260), by Riverview Kennels, Clinton, Mass., to Chas. Altmanuspeiger, Minden, Ia.

Oscar Wild. Pug dog, age not given (Treasure—Trouble), by Geo. W. Dixon, Worcester, Mass., to Frank Meuller, same place.

Knickerbocker (A.K.R. 19)—Lady Isabel (A.K.R. 461) whelp. Liver and white pointer bitch, whelped Nov. 2, 1884, by Knickerbocker Kennel Club, Jersey City, N. J., to Geo. H. Piercy, same place.

Sambo. Imported pug dog (A.K.R. 572), by Clapp & Bailey, Boston, Mass., to Samuel S. McClure, New Orleans, La.

Flora D. Italian greyhound bitch, formerly Chic (Duke—Naughty), by R. C. Prout, Newark, O., to Samuel S. McClure, New Orleans, La.

Sylph. Lemon and white pointer bitch, whelped Nov. 20, 1884, by Fritz (A.K.R. 268) out of Bird (A.K.R. 1658), by Maple Kennels, Patterson, N. Y., to Chas. S. Fitch, New York.

Ashmont Prince. Mastiff dog, whelped Oct. 3, 1884 (Hero II.—Dolly Varden), by Ashmont Kennels, Boston, Mass., to Miss Mary Bullard, Dedham, Mass.

Diavolo. Mastiff dog (A.K.R. 543), by Ashmont Kennels, Boston, Mass., to J. H. Child, East Milton, Mass.

Don Pedro. Rough-coated St. Bernard dog (A.K.R. 1670), by A. K. Johnston, Clifton, N. Y., to St. Bernard Kennels, same place.

Jim and Parker. Red Irish setter dogs, whelped Aug. 23, 1884 (Sancho—Betty Plunkett), by H. C. Hoff, Trenton, N. J., to A. S. Hoffman, Morrisville, Pa.

Mary Dell. Black and white English setter bitch, whelped January, 1883 (Dash III.—Jessie), by A. S. Hoffman, Morrisville, Pa., to Chas. Neal, Trenton, N. J.

Darby. Black and white English setter dog, whelped June, 1883 (Jester—Kathleen), by Chas. Neal, Trenton, N. J., to A. S. Hoffman, Morrisville, Pa.

PRESENTATIONS.

EVERY ONE interested in dogs should secure a copy of "Our Friend, the Dog," a pamphlet on the care or dogs in health and sickness, with a list of canine diseases alphabetically arranged, and the symptoms and prescriptions for their cure. Mailed for 2-cent stamp. Associated Fanciers, 237 South Eighth street, Philadelphia, Pa.—*Adv.*

Rifle and Trap Shooting.

THE NEW ARMY TARGET.

AT a meeting of the directors of the National Rifle Association, held on the 10th inst., Gen. Robbins, Col. Bodine and Capt. De Forest reported on their recent trip to Washington anent the recent changes in the army targets. At present the regulars use a target similar to that of the militia, a circular bullseye and rings. Under the new regulations the army will use an elliptical bullseye, whose height will be one-quarter more than its width. Gen. Sheridan referred the committee to Capt. S. E. Blunt, of the Ordnance Corps, who appeared before the Association, and pointed out the fact that men in the field should be taught to hit the enemy, not to make fancy scores. The armies of England, France, Germany, Austria and Switzerland, he said, use a long target, and he thought that the United States would profit by training its soldiers to its use.

He said that the chief object of training a soldier how to shoot was not that he might make big target records, but that he might hit his man and wound him or kill him. In the army men were wanted who could make good line shots; a shot that would hit a man somewhere. The question of how best to gain this object was submitted to a large number of officers in active service throughout the United States, particularly in the West, and 94 per cent. were in favor of the elliptical target. A soldier who could make a true line shot, would be effective, because he would be sure to hit his man somewhere, and to hit him anywhere was to disable him in action.

The Association decided that the matter being irrevocably settled, nothing was to be gained by discussing it. A vote of thanks was given to General Sheridan for his courtesy. The militia of Maine has decided to adopt the new mode of practice.

The new target will be supplemented by figures representing groups of men standing, kneeling, etc., for skirmishing practice, and by groups of sixteen for short and middle-range file-firing.

This outcome of modern rifle progress in this country moves the *Graphic* to comment and to the bestowal of a bit of well-merited praise on the past work of the National Rifle Association. The *Graphic* says: "It should not be forgotten that to the National Rifle Association belongs the credit of elevating the use of the rifle to the dignity of an exact science; of directing popular attention to its importance as a part of the national military training; of stimulating American patriotism through the international matches; and finally, by public example, causing a revolution in army target-practice, which, based on flint-lock and smooth-bore principles, had become an obsolete exercise. A few years since the War Department, thus reminded, introduced the needed reform, and seconded by Generals Sherman, Sheridan and Hancock in their respective commands, availed itself of the benefits of Creedmoor, until the regulars began to show the effects of competition by winning some important prizes. Military marksmanship was at a low ebb when the National Rifle Association was at the height of its importance as an authority. But the fable of the hen and her adopted duckling is represented in the denouement. The army has adopted the elliptical form of target, instead of that prescribed at Creedmoor, which is circular. The National Rifle Association protest, and are told that the target preferred is similar in outline to the living mark which soldiers must learn to hit somewhere. Having learned all the hen can teach it, the duckling swims off on its own hook, leaving its astonished stepmother fluttering on the bank."

REVOLVER TALK.

Editor Forest and Stream:

I do not agree with ".32-Short" about the penetration of the long and short cartridges. If he will take the pains to try them at pine boards, I feel confident he will find the long shoot much harder than the short. The best .38-cal. pistols I've found yet for accuracy are the Smith & Wesson and the Merwin & Hulbert new styles of .38 double action, with say half to one pound of lead attached underneath the barrel by tying a small rubber band around the lead so as to hold it tightly to the barrel of pistol. It is easily attached or detached, and prevents the upward throw of the arm, so common to all revolvers. A bar of lead bent double is sufficient and is about the right length, costs nothing, and adds greatly to the steadiness. The .22 seven-shot, made by Mr. Marlin, is a fine piece for accuracy. The new .32, 16-inch barrel, made by Smith & Wesson, can't be beat. F Troop had great sport last summer and fall in the Blue Mountains hunting, rounded up there by frosts in July and August. We killed 4,000 rabbits at Rio Deloro (River of Gold) and Piute Springs while camped there.

We have target practice in quarters now with reduced ammunition, 5 to 8 grains powder and a round .45-caliber ball. Such charges always shoot too high, while the same charge in the cavalry pistol, Colt's .45, shoots too low, even with as much as 25 and 30 grains of powder, round ball. Now why is this? The only solution I can see is the different rifling in the two arms, Springfield and Colt's pistol. The latter has a deep wire rifle, the Springfield scarcely any, consequently the ball in the Springfield does not follow the grooves, but goes straight through the barrel, same as a smooth bore, while it takes the grooves in the pistol, consequently has a rotary motion. Am I right or wrong? GEO. H. COOPER, 6th U. S. Cavalry.

FORT LEWIS, Col., Jan. 29.

SAFE RIFLE CARTRIDGE.

Editor Forest and Stream:

I took much pleasure in reading the discussion last year in regard to "The Choice of Hunting Rifles," and noted that several writers objected to the repeating rifle, for other reasons, and because the cartridges in the magazine were sometimes compressed, *i. e.*, the bullets crowded back into the shells, and that occasionally the whole load went off at once. The shortened cartridges, of course, blocked the mechanism of the rifle and rendered it useless for the time being. The following will overcome these dangers and add some conveniences. Instead of the ordinary cartridge use a shell long enough to contain the powder and bullet within itself, and then, since the bullet does not project beyond the shell, it cannot be pushed back into the shell by the base of the shell in front of it, *i. e.*, the shell receives all the pressure, the bullet and the powder none. Hence no jamming or exploding in the magazine. As the edge of the shell might catch on the breech of the barrel at the moment of entering, it would probably be best to bend in or crimp the edge.

As to the conveniences, when a man is hunting squirrels or other small game which are shot at short range, he does not care to use the same charge as he uses for deer, bear, moose, etc. In the new shell he may vary the charge to suit himself, so long as the charge is kept wholly within the shell.

Any repeating rifle may be changed so as to take this shell, by boring out the breech of the barrel just as you would for an extra large shell. It may be made bottle neck or taper also, but in that case the power of varying the load is limited. The ballseater may be so constructed as to the crimping and ballseating at the same time. When a small charge is used the bullet can be seated with a loading rod and a mallet, the shell crimped afterward in the ballseater. The only objection to this shell is that an absent-minded man may fill his magazine with empty shells. That man would make a mistake anyhow, and I should be afraid to go hunting with him for fear he might forget me and shoot me for a bear. C. JULIUS CÆSAR.

RANGE AND GALLERY.

BOSTON, Feb. 14.—There was an unusually large attendance of riflemen at Walnut Hill to day, the increased attendance owing to the fact that team matches between members of the association were to be shot. The weather conditions proved good, the wind, however, blowing rather hard from 3 o'clock. During the afternoon an overcast sky increased the favorable shooting conditions. The range will be open on Saturday next as usual, and also on the following Monday, Feb. 23. The directors have put on the following matches for competition: Victory medal match, to be shot on a decimal target, open one year, distance 200yds, position off-hand, rounds 10, any rifle under the rules. First prize, a victory gold medal to any competitor who scores 10 86s during the year; second prize, a victory silver medal to the competitor who scores 10 80s during the year; third prize, a bronze victory medal to any competitor who scores 10 75s during the year; fourth prize, a silver membership badge to any competitor who scores 10 70s during the year; fifth prize, a bronze membership badge to any competitor who scores 10 65s during the year. No competitor can win more than one medal of a kind, but winners of the medals of lower rank will be eligible to continue in the match and compete for the higher rank medals, but only with scores made subsequent to the 10 scores winning medals.

It is also proposed to have an all-comers' military match, open to all comers, distance 200yds., position standing, any military rifle with a six-pound trigger pull, rounds 5, Creedmoor target. entries unlimited, four scores to count. First prize, a trophy of the value of 30 per cent. of the entrance fees. The scores of to-day are appended:

HIP SHOOTING.—Manchester, N. H., Feb. 3.—*Editor Forest and Stream:* In your report of Dr. Carver's six-day shoot at New Haven, you comment on his making some hip or luch shots at ink bittles. This excited my curiosity, as I had never seen such shooting with the rifle. As a boy I used to handle the bow and arrow pretty well, and thought it might be possible that sufficient practice would enable me to do reasonable work with the rifle without the necessity of raising it to my shoulder and eye. As a trial experiment I tacked up a square of paper with a bullseye patch pasted on it for an object to shoot at. This was done in the house, with distance limited to to about 15ft.; Flobert rifle. I inclose a target shot in this way, with the shots numbered in the order in which they were made. Although none strike the bullseye, still several of the shots are fairly grouped and a 12-inch target made, and with practice the wild ones might be controlled. In the two strings shot previous to the one enclosed two and three shots respectively struck the bullseye. It would seem as though practice might enable one to make quick shots at game at short range, with a reasonable degree of accuracy, without raising the rifle to the shoulder.—A. B. DODGE.

BRATTLEBORO, Vt., Feb. 7.—These scores were made at Oak Grove range by the Brattleboro Rifle Club on the Massachusetts target, 200yds., off-hand:

Cobb	12	11	10	11	12	12	11	10	11	11—111
Nichols	10	11	11	11	12	8	12	12	12	11—110

THE NEW COLT ARM.—The new Colt magazine rifle has been placed on the market. This is the weapon to make way for which the previous Colt magazine rifle was withdrawn. The new weapon belongs to that class of magazine rifle where the breech action is worked by the left hand on the trombone motion in this respect similar to the new Spencer arm.

SPHINX.—Thos. Davis, one of the Canadians, engaged for the Egyptian campaign, fired a rifle ball at the eye of the Sphinx and captured a month's imprisonment.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

THE NATIONAL GUN ASSOCIATION.

Editor Forest and Stream:

In pursuance to an informal call, the sportsmen in attendance at the Second International Clay-Pigeon Tournament, assembled at the office of Richard Rhodes (gun store), 55 St. Charles street, at 8 P. M., for the purpose of organizing a National Association. The meeting was formally organized by the election of Capt. A. M. Aucoin, of New Orleans, La., as chairman *pro tem.*, and J. E. Bloom, of Cincinnati, O., secretary *pro tem.* There were present Capt. A. M. Aucoin, Wm. Mayronne, A. Cardona, Jr., of New Orleans, La.; C. M. Stark, North Dunbarton, N. H.; John S. Snedeker, Brooklyn, L. I.; F. S. Parmelee, Omaha, Neb.; Messrs. A. Bandle, H. E. Peters, H. McMurchy, J. E. Bloom, T. Gastright, B. Teipel, of Cincinnati; John A. Ruble, Ellendale, Dak.; Geo. Essig, Plattsburg, Mo.; Andy Meaders, Nashville, Tenn.; O. R. Dickey, D. Kirkwood, W. S. Perry, of Boston, Mass.; H. L. Baker, Natchez, Miss.; H. A. Penrose, San Angelo, Tex.; Jos. Dits, A. W. West, Parkersburg, W. Va.; W. C. Lefell, Dr. L. E. Russell, of Springfield, O.; W. B. Ralston, Blue Ball, O.; W. L. Colville, Pittsburgh, Pa.; Capt. E. E. Stubbs, Gainesville, Ark.; W. F. Summerson, Staunton, Va.; W. Ackerman, Lima, O.; Mr. Bradley, Bradford, Pa.; C. E. Verges, Lowell, O.; J. A. R. Elliott, J. W. Campbell, of Grenola, Kan.; M. F. Cook, Hartford, Conn.; J. N. Frye, Boston, Mass.; Albert Erichson, Houston, Tex.; H. W. Eager, Marlborough, Mass.; Capt. A. H. Bogardus, Elkhardt, Ill.; L. Good, New York; C. H. Boulter, Cheyenne, Wy. Ter.; John C. Curry, Cincinnati; C. N. Brown, Fenton, Mich.; L. Rainey, Scott, Strong and Stice, of Jacksonville, Ill.; Chas. Hallock, of New York, and Messrs. Sawyer and Davis, of Boston, Mass.

Upon motion of J. E. Bloom, of Cincinnati, seconded by Dr. Russell, of Springfield, O., the following resolution was unanimously adopted, viz.:

Resolved, first, that the sportsmen here assembled do hereby organize themselves into a National Gun Association and invite sportsmen throughout the country to join them in this movement; secondly, that this organization be duly incorporated according to law in the State of Kentucky, according to the general plan outlined in the prospectus heretofore issued by J. M. Barbour, of Louisville, Ky., and J. E. Bloom and John Whetstone, of Cincinnati, with such modifications as may be adopted at this meeting or any adjournment thereof; and, thirdly, that the secretary *pro tem.* be and is hereby instructed to take the necessary legal steps to file and duly complete the requisite corporation papers and all other papers, books, proceedings, etc., required by law to duly carry out the foregoing clauses.

Upon motion of J. E. Bloom, seconded by Dr. L. E. Russell, of Springfield, O., the following resolution was unanimously adopted, viz.:

Resolved, first, that the Constitution and By-Laws be and are

hereby adopted by the National Gun Association; secondly, that the same be referred to a committee of five on constitution and by-laws for revision and report at the next meeting. The chair then appointed for said committee of five the following: J. E. Bloom, of Cincinnati; R. B. Organ, of Chicago; J. K. Renaud, of New Orleans; Jas. N. Frye, of Boston, and Dr. L. E. Russell, of Springfield, O.

Upon motion duly made and seconded and unanimously carried, a committee of twenty on rules for all kinds of shooting at the trap was appointed by the chairman, as follows: Dr. L. E. Russell, of Springfield, O., Chairman; C. M. Stark, North Dunbarton, N. H.; D. Kirkwood, Boston, Mass.; R. Borgan, Chicago, Ill.; A. Meaders, Nashville, Tenn.; Capt. A. M. Aucoin, New Orleans; Capt. A. W. West, Parkersburg, W. Va.; F. A. Cousin, New Orleans, La.; W. Ackerman, Lima, O.; Mr. Chaudet, New Orleans, La.; A. Randle, Cincinnati, O.; H. W. Eager, Worcester, Mass.; Mr. Stice, Jacksonville, Ill.; Mr. Perry, Worcester, Mass.; A. Hunter, New York; Alf Erickson, Houston, Tex.; John Whetstone, Cincinnati, O.; J. N. Frye, Boston, Mass.; Captain A. H. Bogardus and Mr Bradley, of Bradford, Pa.

Upon motion duly made, seconded and carried, the chairman appointed the following committee of three on national badge: H. W. Eager, of Worcester, Mass.; Mr. Collville, of Pittsburgh, Pa., and J. E. Bloom, of Cincinnati, O.

Upon motion of J. E. Bloom, seconded by H. W. Eager, the following motion was unanimously adopted: Resolved, That the secretary pro tem. be requested to now duly open the subscription books for the capital stock of the Association, and that he shall act as treasurer pro tem., receipting for the 10 per cent. or more of the original subscriptions now made.

The secretary then formally opened the subscription books and reported that together with subscriptions previously ordered the total subscriptions already amounted to $900. Upon motion duly made and seconded and adopted, it was: Resolved, first, that a vote of thanks be hereby extended to A. Cardona, Jr., of New Orleans, for his generous and voluntary labors in behalf of the visiting sportsmen It was further unanimously Resolved, That we extend a vote of thanks to R. Rhodes and Leon Marthe for their courtesy and hospitality. Upon motion duly made, seconded and carried, it was Resolved, That when this meeting adjourn it shall adjourn to meet again at this office at 8 P. M. next Saturday, Feb. 14, and secondly, that subscribers to the capital stock alone be then and thereafter allowed to voteon any questions which may be submitted, and thirdly that when we finally adjourn from New Orlans, we adjourn to meet again at Cincinnati, O., May 5 to 10. Upon motion duly made, seconded and carried, it was resolved that the minutes of this meeting be duly included in the minutes of the Association when incorporated. Upon motion duly made, seconded and carried the following modifications of the shooting rules for the ensuing tournament were adopted, viz:

First—That all handicap of winners be abolished.

Second—That all handicap of 10-bore guns as compared to 12-bore be abolished.

Third—That in 5-trap shooting all the traps be "shot out" before any are reloaded, and that in 7-bird matches the first and fifth traps shall be sprung for the last two.

Fourth—That the use of the pool bottle or dice be abolished, and that the pulling of the traps be left to the discretion of the puller.

Fifth—That if a bird be a "no bird," and the shooter accepts it by shooting at a fragment, he must abide by the result whether he hit or miss.

Upon motion of Captain A. H. Bogardus, duly seconded and carried, it was resolved that traps No. 2 and 4 be changed to throw left half quartering and right half quartering respectively, instead of the reverse as heretofore. The Secretary announced that this week's issue of (Feb. 12) FOREST AND STREAM would contain the constitution and by-laws of the National Association, of which 500 would be on sale at this office and on the grounds on next Saturday. There being no further business before the meeting it adjourned to meet again same place next Saturday evening, Feb. 14, 8 P. M.

J. R. BLOOM, Secretary *pro tem.*

NEW ORLEANS, La., Feb. 10.

STAPLETON VS. AQUEHONGA.—The match between four picked members of the above clubs drew an unusual large number of sportsmen to Sea View Park, S. I., on the 12th inst. Both are young clubs, one barely a yearling, yet they show good shooting material for future results. The match was between Chas. Warneke and M. Cahill of the Stapleton Gun Club against Capt. P. Polworth and Vincent Weir of the Aquehonga. (Great fish hooks, where did they capture that name?) While there was considerable betting on the general result, most of the excitement seemed to center on the scores of Messrs. Cahill and Polworth, and deservedly so, as the closeness of the result proves Cahill winning by but two birds in the 100 shot at. Fish Commissioner Col. Endicott was grand master of ceremonies, most ably assisted by Constable Bob Goggin, who kept the crowd in good humor, if he could not always keep it back. A. Waudle acted as judge for the Stapletons, and P. Silvia in like capacity for the Indians, with J. J. Maher of the J. C. H. G. C. as referee and your humble servant as official scorer; and right here let your reporter say that he wishes to extend his thanks to Messrs. Endicott, Fuller, Foley, J. B. Elsworth and others of both clubs for courtesies promptly extended. They are all good fellows down there and while at times the excitement grew rather intense, the best of good nature prevailed throughout the lengthy ordeal. There was a good deal of loud talk in the evening about another match between the same parties on the same terms, to be shot at Foley's Grove, the club grounds of the Stapletons at Stapleton, a much more desirable place to reach (being near ferry) we should judge, as one don't have to depend on trains two or three hours apart. Mr. Foley is a young ardent member of the Stapleton club, and proprietor of the grove of that name, and he assures trap shooters that they will be well taken care of should they give him a trial at any time. The following is the match and score: 50 live birds each man, 25yds. rise, 80yds. boundary, both barrels, gun below armpit until called pull, 2 traps, second barrel anywhere (a large proportion of them on the ground as the result showed and entirely unnecessary). Figure 2 denotes killed with second barrel.

JACOBSTAFF.

ELIZABETH, N. J., Feb. 16.—The Elizabeth Gun Club held their first shoot on their grounds Feb. 12. The weather was cold and very unfavorable for good scores. First match, 5 black birds, 21yds. rise, use of both barrels, second barrel count ½:

Randolph	01100—2	Dolbeer	10111—4
Chetwood	01100—2	Carter	01001—2
Harsell	00110—2	Dackerman	01000—1
Haskard	½1110—3½	Astfalk	01111—4
McBride	00000—0	Jersey	½11½—4

Ties of 4, miss and out: Dolbeer 0, Astfalk 0, Jersey 1. Ties on 2: Randolph 0, Chetwood 0, Harsell 1, Carter 0.

Second Match—5 blackbirds, 18yds. rise, single barrel:

Chetwood	10111—4	Haskard	11110—4
Harsell	11011—4	Dackerman	01100—2
McBride	01000—1	Astfalk	01001—2
Dolbeer	10110—3	W Parker	00101—2
Carter	00011—2		

Ties on 4, miss and out: Harsell 111011—5; Haskard 111011—5, divided first money. Ties on 3: Chetwood 10—1; Dolbeer 11—2, won. Ties on 2: Carter 111—3; Dackerman 0; Astfalk 10—1; W. Harker 110—2, won.

Third match, same conditions:

Chetwood	01111—4	Haskard	11011—4
Harsell	11000—2	Dackerman	00001—1
McBride	00011—2	Astfalk	00010—1
Carter	00000—0	W Parker	11011—4
Martin	11111—5	Richardson	10110—3

Ties on 4: Chetwood 110—2. Haskard 11111—5. W. Parker 11110—4

Forth match, same conditions.

Chetwood	11011—4	Carter	01100—2
Astfalk	10100—2	Dackerman	00111—3
W Parker	11111—5	Haskard	01110—3

Dackerman and Haskard divided third.

Fifth match, some conditions.

Chetwood	11011—4	Astfalk	00100—1
W. Parker	01101—3	Carter	11011—4
Dackerman	00100—1	Haskard	11111—5

Chetwood and Carter divided.

NARRAGANSETT GUN CLUB.—Regular weekly shoot for merchandise prizes; 30 birds, class shooting, 1 trap, 5 angles., 18yds. rise:

W H Sheldon	111111101101001110011111111111—24

BOGARDUS—MEADERS.—The clay-pigeon match between Capts. Bogardus and Meaders, at New Orleans, resulted as follows: 100 singles, Bogardus 85, Meaders 82; 50 pairs doubles, Bogardus 91, Meaders 81; total, Bogardus 176, Meaders 173.

DANIEL CURRY, of Centralia, Pa., and William Curry, of Shenandoah, will have a pigeon shooting match on Monday next for $100 a side.

Yachting.

FIXTURES.

June 11—New York Y. C., Regatta.
June 20—Hull Y. C., Pennant Matches.
July 11—Hull Y. C., Cruise.
July 18—Hull Y. C., Club Race.
July 25—Hull Y. C., Ladies' Day.
Aug. 1—Hull Y. C., Club Race.
Aug. 15—Hull Y. C., Open Race
Sept. 5—Hull Y. C., Champion Race.
Sept. 19—Hull Y. C., Champion Race.

THE AMERICA'S CUP.

NO further news concerning the challenge has yet been received from England, but Mr. A. Cary Smith will go ahead at once with the design for a sloop to meet the challenger, as Com. Bennett has directed the club to begin work on her as soon as possible. The new boat will be about 85ft. waterline, and nearly four beams in length. It is not yet decided whether she will be built of wood or steel.

THE MEET ON LAKE ERIE.

WE publish in our Canoeing columns this week a portion of a circular about to be issued by the yachtsmen and canoeists of Cleveland, inviting all sailors to a water carnival to be held in July on Lake Erie. The object of the meeting is to bring together all lovers of water sports for a couple of weeks of sailing, racing and camping, and while there plans will be discussed for permanent organizations. The canoeists will probably form a union of some sort, and an excellent opportunity offers for the yachtsmen to do the same. If any proof of the advantages of such an organization were needed, the growth of the Canoe Association, and also of canoeing, since its formation less than five years ago is sufficient, and there is very reason to expect a similar prosperity from a union of yachtsmen. Last year the Lake Yacht Racing Association was formed by the clubs on Lake Ontario, open to all clubs on the lakes, but we believe none but those on Lake Ontario have yet joined it. Last year the fleet of the Association made the round of the lake and cruised on the St. Lawrence, holding a number of successful races, and elevating yachting on Lake Ontario to something more than a few local races every year. The uniform system of measurement, and also of racing rules and general government, tends to obliterate to a great extent local ideas and prejudices, and to foster an *esprit de corps* as well as a spirit of competition among the different clubs composing the Association that will exert a powerful and beneficial influence.

We commend to the yachtsmen of Lake Erie the example of their brothers, in the hope that they will imitate it and join with them in the Lake Yacht Racing Association. There is no reason why all the clubs on the lakes should not belong to one large and powerful organization, as their interests are in all respects identical. The ends in view can be better gained by one body composed of representatives of the various localities than by a number of small and insignificant clubs, and the tendency of all sports now is toward centralization of this kind. It may be that local considerations, for a time at least, will make it desirable that each of the lakes shall have its own cruise and series of races, but even in this case it will be best to have all under one management, so that those who chose could make the round from lake to lake, with rules and dates that would allow it. The first and most difficult step, the arrangemnt of preliminaries, has been undertaken by the Cleveland Y. C. They provide courses and prizes, and only ask a full attendance on the part of yachtsmen. The second step, the details of organization, either as an independent body or as members of the L. Y. R. A. must be taken when all are assembled at Ballast Island. In the mean time there is an opportunity to discuss the subject thoroughly, so that when all do meet, no time may be lost over useless preliminaries. The concluding portion of the circular alluded to relates to yachting as follows:

At a joint meeting of the Cleveland Yachting Association and Cleveland Canoe Club held on Jan. 17, 1885, it was proposed to have a meet at Put-In-Bay Islands, Lake Erie, from the 20th to 25th, inclusive, of July next, to which an invitation will be extended to all yacht and canoe clubs of the lakes and western rivers. During the meet there will be a regatta given by the Cleveland Yachting Association open to all yachts of the first, second and third classes, in which silk championship flags will be given to the winning yachts of each class; also sailing, capsize and paddling races given by the various canoe clubs, and a grand banquet and ball. In order that yachts wishing to participate in the annual regatta of the Cleveland Yachting Association, formerly held on the Fourth of July, the former has been postponed until the 16th day of the same month, after which the yachts will sail in squadron from Cleveland to the islands.

The ultimate object of this meet is for the formation, if possible, of a Lake Erie Yachting Association, comprising all yachts on Lake Erie including those of Detroit. With a view to this the Cleveland Yachting Association at its meeting elected the following named officers and committees who should hold office until such other officers from the various associations should be elected at the general meet: President, George W. Gardner; First Vice-President, R. R. Rhodes; Second Vice-President, I. V. Harkness; Corresponding Secretary, J. George Downie; Recording Secretary, J. S. Williams; Treasurer, Percy W. Rice; Measurer, Henry Gerlach; Assistant Measurer, B. Lyman; Surveyor of Course, W. P. Francis; Regatta Committee, H. D. Coffinberry, W. Scott Robison, R. E. Mix, Frank Brewster, H. G. Phelps; Reception Committee, James Gibbons, Wm. Winch, L. H. Ware, J. M. Raleigh, F. H. Smead, C. W. Kelly, J. George Downie, Henry Gerlach, J. S. Williams, G. W. Gardner, Dan P. Ello, I. V. Harkness; Committee on Banquet, W. H. Eckman, G. Harry Gardner, N. P. McKean, James Gibbons; Finance Committee, Percy W. Rice, Chairman, (to be filled later).

Classes and prizes governing the regatta to be held at the islands:

First Class.—Entrance Fee $10.—For yachts measuring over 35ft. on waterline. First prize, silk championship flag and one-third of the entrance money. Second prize, the remaining two-thirds of the entrance money.

Second Class.—Entrance Fee $5.—For yachts measuring between 22 and 35ft. on the waterline. First prize, silk championship flag and one third of the entrance money. Second prize, two-thirds of the remaining amount of the entrance money. Third prize, the remaining amount of the entrance money.

Third Class.—Entrance Fee $3.—For yachts measuring under 22ft. waterline. Entrance money to be divided the same as for first, second and third prizes.

We would be pleased to hear from you at as early a day as possible, whether the above meets with your approval and whether you would be willing to take part in the same. Communications should be addressed to J. George Downie, Secretary Cleveland Yachting Association, Public Square, Cleveland, O.

ELECTIONS OF OFFICERS.

Eastern Y. C.—Feb. 10.—Commodore, Henry S. Hovey: Vice-Commodore, J. Malcolm Forbes; Rear Commodore, William F. Weld; Secretary, Edward Burgess; Treasurer, Patrick T. Jackson, Jr.; Measurer, Edward Burgess. Regatta Committee—George A. Goddard, Daniel Appleton, Edward B. Haven, Henry B. Jackson and Frank E. Peabody. Members of the Council at Large—C. O. Foster and G. F. Upham, Jr. Committee on Admissions—J. Malcolm Forbes, F. B. Cunningham, O. W. Peabody, W. G. Saltonstall, C. P. Horton, B. W. Crowninshield, Percival L. Everett, Augustus T. Perkins, Alanson Tucker, F. L. Higginson and R. S. Russell. House Committee—John A. Burnham, P. L. Everett, B. W. Crowninshield and Edward Burgess.

Quaker City Y. C.—At the annual meeting held on Wednesday evening, the 11th inst., at the club house, West Jersey Ferry, Camden, the following list of officers were elected for the ensuing year: Commodore, Robert P. Thompson; Vice-Commodore, Benjamin F. Murphy; Rear Commodore, M. H. Lindsey. President, Wm. J. Thorman; Secretary, Samuel B. S. Barth; Assistant Secretary, William S. Hoffman; Treasurer, Samuel P. Wright; Measurer, Rufus G. Wilkins. Board of Trustees—George W. Fite, William H. Vallette, Samuel A. Wood, Charles E. Ellis. Regatta Committee—David C. Walker, Richard W. Kerswell, Robert M. Fitch, Jr., Charles L. Wilson, Lemuel S. Roberts.

Larchmont Y. C.—Commodore, Augustin Munroe; Vice-Commodore, A. Bryan Alley; Rear Commodore, Oliver Adams; Secretary, W. Harris Roome; Treasurer, Thos. B. Brown; Measurer, Frank E. Towle; Trustees, Thos. R. Fisher, E. L. Bushe, J. B. Miley.

THE LENGTH AND TONNAGE CLASSES.

Editor Forest and Stream:

The letter signed by "C. P. K.," in your issue of the 15th inst., bearing on proportion of beam and length, I think should be read with qualifications. One has to be cautious in adopting extreme length with correspondingly reduced breadth in any case, but more especially for a vessel intended for an all-round successful prize taker.

The British racer has about attained the extreme proportion advisable in all classes for the present tonnage racing. The great question of the day is the best all-round proportion for a pure length class, and this opens up a wide field of inquiry and speculation, for here we have conflicting evidence. For instance, the example taken by "C. P. K.," of Eclipse and Currytush, generally speaking, the one of the very broadest, and the other of the very narrowest of the whole fleet, and the two most wonderfully successful boats ever built in their respective classes. But comparing Isa with Eclipse, both new boats of the same length, and the former of medium proportions, we find Isa not in it with Eclipse. Other examples of a similar nature might be cited.

Currytush did what might have been expected of her, and what was really predicted of her under the conditions of wind and sea in the two races in question. In a good breeze and sea, the 3-tonner could tackle and outsail Eclipse "by the wind" but not so "off the wind." There is not the slightest doubt that the little one would be the best under a tonnage rule, and would be the most comfortable in a breeze of wind out in the open channel, and in the latter respect she has made her regatta port when many an abler (cruising) boat than Eclipse "could not be kept at it."

It was not the extreme beam of Eclipse made her the successful 30ft. racer, but the more moderate beam of Isa made that vessel a failure in this respect, nor the extreme proportions of Currytush made her the cock of the walk in the "Punch and Judy" class. There is no doubt that Currytush could be improved as an all-round vessel by increasing her beam somewhat; but then she would not be a 3-tonner.

What the best proportion of length and breadth for a length class boat is has yet to be solved by experience. FIVE-TONNER.

CRUISE OF THE MOLLY.

THE Molly is a 5-tonner, yawl rigged, pole mast, carrying only jib, mainsail and jigger, with iron shoe of 4,700lbs. and 3,700lbs. lead in hold, and drawing 4ft. 9in. Everything being ready as to provisions, with two oil stoves made fast in forecastle, we made a start, as we had to call at the Beach, where my family were spending the summer, and at which our lake voyage began. Crew consists of myself, the owner, James Doyle, professional sailor and boat keeper commonly called "Jim," and the useless cook known as "Dob." Object of trip, to try the yacht and visit Brockville, my native place.

Wednesday, Aug. 13, 1884.—Left Burlington Beach 5 P. M.; wind very light; sighted Toronto at daylight.

Thursday, 14th.—Made Toronto at 10 A. M.; purchased compass and chart; left port at 2:30 P. M.; bound down the lake: wind S. W. and very light.

Friday, 15th.—Frenchman's Bay Light in sight; passed light at 1:30 A. M.; off Whitby Light at 9 A. M.; wind light, S. W.; wind freshening; off Oshawa at 11 A. M.; wind S. W.; a schooner followed us from Toronto and has gone off to the S. W.; noon, wind all gone, a slight roll, dingy towing badly; Port Darlington sighted at 12:20 P. M.; sun very hot, looks like a thunder storm; 2 P. M., abreast Darlington Light, Newcastle in sight; 4 P. M. abreast Newcastle; no wind, a dead sea rolling, very hot and the flies troublesome; we have sighted no vessels to-day; as the wind is light we propose to keep at work; last night Jim stood watch till 4 A. M., when I took her till 4:30 A. M.; 7 P. M. steamer Corinthian passed us on her down trip five miles below Newcastle; the schooner which left Toronto with us is abreast, ten miles out; we have decided to try for anchorage; 7 P. M. anchored in six fathoms; took dinner and turned in; the day has been a scorcher.

Saturday, 16th.—1:20 A. M. Wind N. and puffy. Port Hope Light in view, up anchor and off, yacht doing well and sailing fast; 5:20 A. M., off Port Hope, wind more easterly, every prospect of a warm day, sun rising very red, full light now on our weather bow, distance 3 miles; 8 A. M., wind all gone, steamer Norseman passed bound for Port Hope; 11:30 A. M., Cobourg harbor, provisioned and left port at 1 P. M., light wind from the east, stood out about 5 miles in the lake when wind left us, wind light and variable afternoon and evening, I stood watch until 11:30 P. M., when Jim took her, mail boat passed down about 9 P. M. 8 miles to the north of us.

Sunday, 17th.—Wind E. and very light, sighted Presque Isle Light at 3 A. M. and abreast of it at 6 A. M.. Scotch Bonnet sighted at 7 A. M., light airs from S. W.; 11 A. M., abreast Scotch Bonnet, wind S. W. and light, passed between Nicolas Island and the Bonnet, course E. S. ½ S., sun not so hot as we have had it for two days; 1:30 P. M., abreast Big Sandy Bay, Long Point Light in view, wind moderate, S. W. accompanied with a long roll and sea from the E.; a large three master to the S. W., distance about 5 miles, yacht behaving well in the sea; coffee pot on the stove which the pitching does not seem to affect; 3 P. M., off Salmon Point Light, wind still light and sea gone down, the three master has fallen behind, and at 6:15 P. M., abreast Long Point Light, all hands badly burnt with sun; every prospect of wind to-night; our coal oil stoves are doing splendidly; anchored in three fathoms of water, when sounding for anchorage lead fouled a net, out of which Jim took the largest fish I ever saw in these waters, I think it a sturgeon (we put a line through its mouth and gills, towing it the first day 70 miles to Kingston and next day 50 to Brockville, all which time it fought us, and was quite lively; when Brockville was reached on Tuesday, we gave it 30ft. of line and had it on view until Thursday, when we killed it by chopping of its head, and distributing the steaks among friends).

Monday, 18th, 2 A. M.—Wind S. and light, got under way with our big fish towing at the stern; 5 A. M., very hazy and supposed to be within a few miles of the False Ducks. These ducks are distant from Long Point 22 miles and 32 from Kingston; 9 A. M., off Point Traverse Light; 9:30 A. M., passing between Timber Island and False Ducks' Light, sails wing and wing, course N. E. The three-master is in sight again to-day, and is losing ground. This is our first wind of any consequence, and the Molly is behaving well. No boat could steer better, and every one satisfied: 12 M., off Amherst Island; 2:30 P. M., off Simcoe or Nine Mile Light, wind about gone. We have decided to pass Kingston and enter the river; 4 P. M., left Kingston to port; at 6:30 P. M., drop anchor at the head of St. John's Island, well satisfied with the day's run.

Tuesday, 19th, 4:30 A. M.—Got under way, wind S.; have decided to go by the middle channel and the inside of Grenadier Island. Arrived in Brockville at 12 M.

RETURN VOYAGE.

Friday, Aug. 22, 9 A. M.—Wind W., cloudy, with prospects of rain. Ran to the American shore, when the wind changed to the S. dead in

our eyes. Worked up the Narrows on the American side, wind freshening and puffy; 1:30 P. M., off Chippewa Point, starboard shroud parted; ran back to Blind Bay for anchorage. On examination have decided that a new mast must be put in before crossing the lake; spliced old shroud, and put up a heavy topmast shroud. Jim thinks it may stand till we get home—we will try it; 6 P. M., have decided to spend the night where we are.

Saturday, 23d.—2 A. M., wind N., but too dark to move; 6 A. M., got under way, wind W., made a good run to Sister Light, when the wind hauled round to the S, dead in our eyes; 8 A. M., steamers Rothesay and Corinthian passed down; 10 A. M., abreast Alexandria Bay, wind puffy and disagreeable, Molly working well against wind and current; 2 P. M., dropped anchor for dinner; any number of steamers and steam yachts have passed to-day—too numerous to mention; 3 P. M., the sky looks like a thunder storm; dinner over we reefed the mainsail, and at the beating again; 4 P. M., a thunder storm coming on, secured and tied up at the Limburger cheese factory docks, having beat sixteen miles since morning; I think Molly worked best under easy canvas, mainsail reefed; night fine, very high wind.

Sunday, 24th.—5 A. M., wind N. W., very puffy; took her out with all sail, but soon had to reef; 6:30 A. M., opposite Clayton, a very high sea running from the N. W., took in jib and jigger to save our masthead, yacht laboring hard; have decided to run to the lee of Long Island; breakfast and bath; 10 A. M., reef mainsail, got under way; 4 P. M., we have had variable winds all day, and are now off the Battery abreast of Kingston, and our cook wants to go home, as he thinks the craft is too small to cross the lake; have decided to keep on our course, and stand up the inside of Amherst Island; 11 P. M., abreast Upper Gap Light; considering the variable winds we have had, we have done pretty well to-day.

Monday, 25th.—Wind N.E., sea running very high; we have decided to make shelter under Timber Island; 3 A. M., anchored in 10ft. of water. 5:30 A. M. wind has hauled round to S. and we have run to South or Prince Edward's Bay, where we are lying with comparatively little motion. Cook no use, but has decided to make an effort to procure tobacco for himself. 9 A. M. a yawl yacht passed, running before the storm (I have since found that the storm signals were hoisted for this day and the next); we think it is from Toronto, and we saw it enter the Gap; 10 A. M. wind S. and very heavy, we are in good shelter. Cook went foraging without a basket and brought back two loaves of bread, one dozen eggs, supply of tobacco, for himself, and a tin pail which he said a kind peddler had presented him with.

Tuesday, 26th.—1 A. M. everything looks bad, heavy black clouds cover the sky; a very dirty night with prospects of a change of wind; we got on the mainsail, hoisted anchor and made for open water, where we encountered a tremendous storm of wind and rain, and blinded with the lightning; 4 A. M, daylight began to come, and we saw the shore on three sides of us, when we decided to run back through the Gap to Macdonald's Cove in the Bay of Quinte, which we reached at 8 A. M.; wind S.W.; we found a schooner had gone ashore at the Gap in the storm, also one steamer, and other vessels there in shelter, also the yawl yacht, which proved to be the Escape of Toronto; 11 A. M., wind still very high; we find ourselves none the worse of last night's adventure; 3:30 P. M., I have just returned from the village of Primuier, where I found a telegraph office and telegraphed to the friends, "Storm bound likely to be here some time; answer me here" (which telegram never reached its destination). The gentleman on the Escape has his wife accompanying him; 8 P. M., change of wind W.; 9 P. M. turned in and slept till 1:30 A.M.

Wednesday, 27th.—3 A. M., wind N.; got under way and passed out of the Gap at 4 A. M., a heavy sea running; ran between Timber Island and Traverse Light; passed light at 6 A. M.; reefed mainsail, but found it did not work running before the sea, so we had to shake out the reef and take in jigger; in this rig we found she steered steadier; 9 A. M., cooked breakfast, sea going down; 9:45 A. M., abreast Tongue Point Light, the dread of the lake; 11 A. M., abreast Salmon Point Light, wind and sea falling fast; 4 P. M., abreast Scotch Bonnet Light, no wind, but very like a thunder storm; prepared our usual meal—broiled ham, potatoes, onions and tomatoes, bread and butter, tea; 5:30 P. M., change of wind, S., heading for Cobourg, distant 30 miles; 6:30 P. M., abreast Presqu'Isle Light, wind now began to fall and a drifting match commenced.

Thursday, 28th.—Reached Cobourg at 3 A. M., came to anchor in harbor, turned in, having been on deck twenty-four hours; 3 A. M., cook paid off and sent ashore; Jim and I have decided to take the Molly home ourselves, as he thinks he can do all the cooking we require; 8 A. M., went to the Arlington for breakfast, telegraphed home, bought papers and got under way; 10:30 A. M., Gull Light on starboard bow; abreast Port Hope at 11:30 A. M., wind light and variable, rolling about in an old sea; off Newcastle at 6 P. M.; anchored in Darlington Harbor at 7 P. M. A heavy squall came on from the west and suddenly chopped round to the east. We remained in port visiting friends till next day.

Friday, 29th.—Darlington Harbor, 9 A. M.; rain; wind E., a big sea running outside; 4 P. M., wind changed to N. W., so we put out; 5:30 P. M., opposite Oshawa, wind very light; 7:30 P. M., change of wind, S. W., Whitby on our lee bow, distant three miles; we are going to try for Pickering Light, as there is not much prospect of wind, and an old sea running from the S. W.; the light we could not find, and as the wind left us, the sea was driving us toward shore, we dropped anchor at 11:30 P. M.

Saturday, 30th.—No wind, heavy fog; 7:30 A. M. Scarboro Heights supposed to be visible; 10 A. M., heavy wind from the S. W. and with it the fog lifted; when the yacht Escape, which we left in Macdonald's Cove on Wednesday morning, appeared about a mile to leeward of us. Now a heavy day's beating commenced, wind and sea being dead in our eyes; we kept her to it and reached Toronto at 4 P. M.; the large yacht which we took in the morning for the Escape, was no where to be seen; as we had enough to do attending to our own business all day we had not time to keep an eye on her movements. As it was Saturday and I had not heard from home for a week, I proposed to Jim to get a man to help him to bring the yacht to Hamilton, and I would take steamer for home, which I did. On my arrival I found all friends anxious as my telegrams had miscarried.

Sunday, 31st.—3 P. M. the Molly was at her home buoy, Jim having brought her from Toronto alone; wind N., very squally, so much so that she had been close reefed and shaken out three times in the forty miles run.

AROUND THE HORN.

THE coming voyage of the little schooner Carmelita from New York to San Francisco, calls to mind other yachts that have made the same trip in some way, most of them, however, not on their own bottoms. Long and dangerous as the voyage is, it was made when the gold fever was at its height, by some curious craft, several small steamboats reaching San Francisco in safety, and it is even told that two canal boats were fitted up and sailed around, though, unfortunately, no proof is given. Of yachts the first to attempt the voyage was, we believe, the yawl Chimera, which was wrecked on the passage in 1849. In 1850 a small schooner, the Mist, was brought out on the ship Loochoo, and in the same year a Newport catboat, the Swallow, was brought out on the brig Swiss Boy, but was lost on her first trip outside the Heads. About 1852 the Eureka, a Mystic sloop, was brought out on the Star of the Union, and in 1858 the Restless, also a sloop, on the ship Andrew Jackson. The George Steers, about 30ft. long, came on a ship about 1856, and was turned into a steam yacht, being burned up finally, and the sloop Templar, catboats Fisherman, Snakedigger, pertiauger Victor (of Nantucket), were all brought out on ships about 1858-61.

The sloop yacht Clara was brought from New York on the ship Young America, but did not prove a success in San Francisco waters, and her owner, Mr. Jabez Howes, brought out on the deck of the famous Three Brothers, the sloop Annie, 45ft. long, built by Robert Fish in 1861. Her spars were reduced, and we believe she was partly rebuilt and strengthened, and she is now the flagship of the Pacific Y. C. In 1865 a schooner, the Petrel, sailed out, and after being used for a time as a yacht, was sold for a trader; and the same fate befel the Chelsea Smith, a Mystic sloop, brought from New York to San Carlos on a ship, and sailed from there to San Francisco. In 1865 also the Howadji, a catboat, came out by ship; in 1861 the sloop Flyaway with an iron keel, in 1869 the Amelia Platt, a steam yacht, and the Skimmer, a catboat from Philadelphia. The first catamaran was sent by rail in 1869. Perhaps the best known boat of all is the little yawl Frolic, brought by ship from England in 1851 or 52. The largest yacht yet sent from the East to San Francisco is the Ariel, 69ft. on waterline, a centerboard schooner built by Poillon Bros. in 1873. Many of these yachts are still afloat—Ariel, Annie, Clara, Eureka, Restless, Snakedigger, Hattie, Skimmer, Petrel, Chelsea Smith, though some have changed names, or have been sold for trading purposes.

The vessels against which Carmelita will try conclusions next season have nearly all been built in San Francisco, and differ greatly from her in type, being principally wide centerboard boats with inside ballast. Of the keel boats there are Lurline and Halcyon, each 72ft. waterline, and Casca 85ft., and all three of 21ft. beam. The centerboards are Nellie, 57x19ft.; Aggie, 70x23ft.; Fleur de Lis, 60x18ft; White Wing, 50x18; Virginia, 56x18½ft; Chispa, 57x19ft.; Ariel, 69x18½ft., drawing from 8 to 9ft. In rig they are inferior to the new vessel, while none enjoy the advantage of so large a proportion of ballast low down. In build they are heavier and more clumsy than Eastern yachts, and being, as a rule, built for rougher water and stronger winds, their sail areas are small. The Eastern boats that have been tried there have all been strengthened, and their sail spread cut down, in which condition they have hardly proved equal to the homebuilt boats.

Carmelita's voyage out will test pretty thoroughly her sea-going powers, and on her arrival we shall look to see her demonstrate the superiority of depth and ballast, coupled with moderate beam and good form, over the wider and shallower models now preferred there.

THE MAMIE.

Editor Forest and Stream:

I was delighted with your handsome and comprehensive illustration of the new yacht Mamie, and hope you will follow up with a plan of her rig, as I have serious thoughts of building such a boat for my use on the lakes. A. R.

[The rig and cross section of Mamie will be found illustrated in detail in the new book "Small Yachts," which will appear next month through the office of this paper.]

SAIL AREA AND THE NEW SLOOP.

FROM the dimensions of the new sloop to be designed by Mr. A. Cary Smith, for the international contest, the general inference is that she will be long, rather moderate in beam and also in displacement. Hence a proper sail area will be correspondingly moderate. Without having exact figures concerning the rig of this new sloop or of Genesta, no positive comparison can be made. But I think it is safe to say the sloop will carry less sail in proportion to her length than the cutter Genesta, and consequently the length and sail area rule of the New York Y. C. will operate in favor of the sloop and against the foreign cutter. That is diametrically opposite to the stand taken by the blundering bigots who have been seeking to forestall a possible cutter victory in their attempts to mislead and befog the public in the matter of measurement. The Genesta, having been built under a very different sort of rule, is not designed to evade or even to fit the N. Y. Y. C. rule. But our representative will now be got out with especial reference toward conciliating the exactions of the rule. The advantage clearly is on our side. This is all proper and fair enough. It is one of the eventualities the English had to consider when issuing their challenge under the deed of gift. Considering the foregoing, I trust that even the campaign committee of so august a body as the Pugwugs, who meet once a month for the manufacture of slanderous diatribe in one of the marble palaces which line that stately thoroughfare yclept Boulevard de Varrique, will now double bit on their measurement claptrap, and try some other tack. C. P. K.

CUTTERS AS CRUISING BOATS.

Editor Forest and Stream:

An old Latin fable, learned in my schoolboy days (now more years ago than I care to think about) was forcibly brought back to me by reading some remarks in the *Spirit of the Times*, called up by a report in the New York *Herald* to the effect that Genesta and Galatea were to race across the Atlantic, using trysails instead of mainsails, and without their topmasts. The fable was, *Ne sutor ultra crepidam*, for anything more completely wide of the mark than the inferences deduced from conditions of this reported match by the writer in the *Spirit* cannot well be, and shows very clearly that he hasn't the faintest elementary knowledge of the type of vessel that he is criticising. He may be, and doubtless is, a reliable authority on the merits or otherwise of the wide, shallow centerboard; but of the qualities and characteristics of the English cutter of the present day he is evidently in total ignorance.

Now, assuming that the *Herald*'s report is correct and that the conditions of the race are that trysails alone shall be used and no topmasts pointed, what more does that prove than that a racing outfit is not adapted for cruising, and it has as little bearing on the merits of the hulls as has the color of the paint on their sides. Possibly, also, there is an idea that after a drilling across the Atlantic the mainsails might not be altogether improved and not quite in a condition to sail the races for America's cup.

What yachtsman in his senses would spar and rig his vessel for all-round cruising all weathers in the same fashion that he would for match sailing alone; and yet, forsooth, on the strength of this doubtful rumor the writer in the *Spirit* runs amuck at the seagoing qualities both of the yachts and their owners. With regard to one of the latter, at all events, he is singularly unhappy—the owner of Galatea, who is his own skipper and navigator, and who, when he had Gertrude (a 30-ton yawl), made her his home and lived on board with his wife for fifteen months at a spell. Talking of Gertrude, I should have liked the writer of the article to have been alongside of her in any of his centerboards on the occasion of her (Gertrude's) beating out over the bar of the Tagus in something like half a gale of wind, engaging in an ocean race from Lisbon to a port in the Mediterranean. That would have opened his eyes to the value of depth and lead, and he would have written in a far different strain for the future, that is, if the centerboard he was in had brought him safely out of the hurley burley (for there is a hurley burley there to some tune on a weather-going spring ebb and half a gale singing in the rigging). The critic would show more discretion perhaps if he refrained from prophesying until he knew, and confined his critical remarks to subjects with which he was thoroughly conversant, and not like the cobbler in the fable, go beyond his last. Henry E. Bayly.

Exmouth, Devon, Jan. 26, 1885.

[The foolish and ignorant attempt to cry down cutters as cruising boats, to which Captain Bayly alludes, has failed entirely; the critic having been informed of his blunder, and now coming out on the other tack with the announcement that such a rig is eminently proper. It is a pity, for the credit of American yachtsmen, that such rubbish should find its way abroad as an expression of honest opinion, as those ignorant of the source whence it emanates might imagine that American yachtsmen were green enough to believe such stuff. Captain Bayly's letter corroborates the views we have always expressed concerning British yachtsmen and their boats; views which the craft themselves will fully justify before the season is over.]

EASTERN Y. C.

THE Eastern Y. C., of Boston, held their annual meeting on Feb. 10, at which the following officers were elected: Commodore, Henry S. Hovey; Vice-Commodore, J. Malcolm Forbes; Rear Commodore, Wm. F. Weld; Secretary, Edward Burgess; Treasurer, P. T. Jackson, Jr.

The committee on measurement and sailing regulations lately appointed, Messrs. J. Malcolm Forbes, Chas. J. Paine, Wm. Gray, Jr., F. C. Peabody and Edward Burgess, reported in favor of adopting the rule of measurement in use by the New York Y. C., or twice the waterline length, plus the square root of the sail area. The effect of the rule will be to increase the measurements of the smaller boats more than of the larger, as the sail area of the former is proportionately much greater; and in consequence, the smaller boats would receive less time from the larger than formerly. To remedy this it was decided to grade the time allowance according to the speed over the course, increasing it one third if the speed of the first and second classes is over 6½ miles per hour, and the speed of the third class over 5 miles. This will be fairer to all, as an allowance which is equable enough in light weather becomes entirely too small in a blow. The full changes made in the rules are as follows:

3—Classification.

Yachts shall be divided according to their racing measurement, as follows:

Schooners—

First class, measuring 70ft. or over.

Second class, measuring 50ft, or over, but under 70ft.

Third class, measuring under 50ft.

Sloops, Cutters and Yawls—

First class, measuring 50ft. or over.

Second class, measuring 40ft. or over, but under 50ft.

Third class, measuring under 40ft.

Yawls shall receive time allowance at seven-eighths of the measurement. Any yacht may enter races with yachts of a higher class than that in which she belongs by assuming the minimum measurement of the class she enters.

Should there be only one starting yacht in either the first or second class sloops, these classes shall sail together, without special notice, forming one class.

4—Measurement and Allowances.

Yachts shall be rated for time allowance according to the following measurement: To the square root of the sail area add twice the waterline length and divide this sum by three.

These measurements shall be obtained as follows:

A base line to be taken from the bee-hole or point of contact of the jibstay on the bowsprit, or flying jibstay on the jibboom, in a straight line to the end of the mainboom, with one-quarter the length of the gaff, measured from afterside of the mast to the end, added thereto.

A perpendicular to be taken along the afterside of the mainmast from the under side of the gafftopsail block or sheave on topmast to the upper side of boom when the latter is resting on the saddle, the distance of such point from the main deck to be recorded by the measurer, together with all other points used in measurements.

To obtain the estimated sail area from these figures multiply the base by the perpendicular and divide by two.

The length shall be measured from the forward side of the stem, at the waterline to the end of the waterline at stern wherever found, exclusive of any part of the rudder or rudderpost. This measurement shall be taken when the yacht is afloat and in her ordinary trim, and with the crew stationed amidships.

Allowances shall be figured according to the table adopted by the club. Measurement to be in feet and half feet. In case of the sloop, cutter or yawl classes, when any yacht of the third class sails the course over the actual rate of five knots; when any yacht of the second class exceeds the same rate, the allowances for such classes shall be increased by one-third the amount given by the table.

12—Boats, etc.

Every yacht measuring less than 70ft. and more then 50ft., shall carry a serviceable boat not less than 10ft. in length.

13—Crew. Third Class Yachts

shall not carry more than one man for every four feet racing measurement.

14—Starting.

All starts shall be flying, and the yachts shall start in the following order: First, first class schooners; second, second class schooners; third, first and second class sloops, cutters and yawls and third class schooners.

HULL Y. C.

THE Hull Y. C. held a special meeting at the Parker House on Feb. 14, with Vice-Commodore Forbush presiding, to consider the proposed amendments to the by-laws and sailing regulations, and the following amendments were adopted:

I.—Amendments to the by-laws, proposed by the treasurer, Chas. C. Hutchinson.

a. Article IV.—Duties of the treasurer: To eliminate words in the first sentence to read as amended, "The treasurer shall collect all rents, assessments and dues."

b. Article IV.—Duties of measurer: To add words to the article, to read as amended: "The measurer shall measure all the yachts enrolled in the club, and report their measurements to the secretary. He shall also collect fees for the same."

II.—Amendments to the sailing regulations;

a. Rule 2.—Measurements: Amendment as proposed by the treasurer, Charles C. Hutchinson: To eliminate words of last clause, to read as amended, "The measurer shall receive for measuring yachts enrolled in the club his necessary traveling expenses and fees as follows: For yachts 38ft. long and over, sailing length, $3; for yachts 26ft. and less than 38ft., sailing length, $2; for yachts under 26ft., sailing length, $1.

b. Rule 5.—Amendment as proposed by the regatta committee: To eliminate the whole of first clause in regard to Corinthian prizes, and to substitute, "There shall be sailed each year at least one race under the full Corinthian rules;" and to eliminate that part of the second clause that refers to first prizes, rule to read as amended: "No second prize shall be awarded in any class unless three yachts start, except in the case of a postponed race, where the requisite number shall have originally started in the class in question. No prize will be awarded any yacht failing to make the race within the limit of time."

c. Championship pennant regatta—Amendment as proposed by the secretary, Peleg Aborn: To eliminate the word championship.

LENGTH AND SAIL AREA RULE IN BOSTON.

THE adoption by the Eastern Y. C. of the length and sail area rule of the New York Y. C. is another milestone on the road to a common system of measurement, and coming at this time is a forcible and practical contradiction of the rubbish uttered for some time past in regard to the New York Y. C. and their rule.

The members of the Eastern Y. C. have never been classed among the "feather-brained advocates of the English cutter," nor have they at present any races with that class of boat in prospect, and yet they have, after careful deliberation, accepted the report of their committee and adopted the rule. By this action they fall into line with the New York, Seawanhaka and Knickerbocker clubs, besides those comprising the Lake Yacht Racing Association, in the adoption of a common system of measurement that so far as can be foretold now promises to answer better than any that has preceded it. The committee on whose recommendation the rule was adopted are all experienced and practical yachtsmen, and uninfluenced by any consideration other than the advancement of yachting, and an endorsement from such a source more than offsets the illogical and false statements thrown out to manufacture public opinion over the forthcoming international races.

Now that it is common for the cutters at least, of the New York Y. C. to spend a portion of the season in Eastern waters, and to take part in the spring and fall matches of the Eastern Y. C., while both fleets join at Newport for the races there in regatta week, the value of a common system of measurement has become apparent. When yachting, both in New York and Boston, was merely a local sport, and boats seldom or never left their home waters, it made little difference what rules prevailed at either place, but now that the sport is each year becoming more national and less local the necessity for one system of rules and measurement is very evident, and it is not too much to hope that at some distant day, though we fear not very soon, local prejudices may give way to the general good, and American yachting may be conducted in the same thorough manner that even now characterizes some of the minor sports.

There is a general movement on the part of yacht clubs to examine their rules of measurement with a view to changing for something better, and we call their attention to the fact that the sail area and length rule has been adopted by three out of the four largest American yacht clubs, by the Knickerbocker Y. C. and by the Lake Yacht Racing Association, while abroad it has been adopted as an alternative rule by the Yacht Racing Association of Great Britain, and is strongly favored by many in place of the present tonnage rule.

We have shown at various times in the Forest and Stream that instead of being greatly favorable to the cutters, in some cases it penalizes them more, and bears less heavily on the sloop, than older rules, and its general effect is only to lessen the rig in cases of gross oversparring, the measurement differing but little from waterline length in any boat of moderate type. It is extremely probable that during the season several more of the smaller clubs will be called on to consider this same rule, in which case we advise them to weigh well the practical indorsement given by the principal clubs against the wild and unsupported statements made in some quarters against it.

A NEW WINDLASS FOR FISHING BOATS.—The American Ship Windlass Company, Providence, R. I., have just introduced a new patent pump brake windlass especially designed for fishing vessels. The starboard side is fitted with the regular wild cat to take an inch chain (the same as in ordinary coasters), but the port side is provided with a solid barrel or drum for the rope cable, which all fishermen carry for deep-water anchorage on the Grand Banks. The advantages to be gained by adopting this new windlass are, that the anchor can be dropped almost instantly and can be hove up in nearly half the time now taken by the old style wooden windlass. It can be brought up from the bottom with far less labor than before. When the anchor is let go the barrel of the windlass revolves with the hawser as it runs out, thereby reducing the friction upon the ropes to a minimum. With the "Providence Fishermen's Windlass," the 500 fathoms of hawser, costing a dollar per fathom, will last twice as long as it now does in the ancient windlass, which has never been improved since it was first introduced half a century ago. The average life of a tarred manilla cable as now used on a fishing vessel is a year, but the American Ship Windlass Company's apparatus will extend its use from eighteen months to two years. Messrs. John James & Co., of Essex, Mass., have secured the agency for the State of Massachusetts. The "Fisherman's Windlass" was designed by Mr. G. Foster Howell, of New York, but it is owned and controlled by the manufacturers of the "Providence" windlass.—*Exchange.*

ULERIN.—It is stated in the London papers that this famous 10-ton cutter has been bought for shipment to America. She is the smartest of her class. We also hear of a little 3-ton beauty to be brought out next spring. Should the races this season turn in favor of the expected cutters, it would give great impetus to the importation of English-built yachts. Good vessels, ex-racers of two or three years' age, can be purchased abroad for one-third the cost of building here. Adding expense of shipment and duty, usually only upon nominal valuation, also 10 per cent. for depreciation due to age, and the cost of an imported cutter will still remain less than two-thirds the figure at which she could be duplicated here. The presence of numerous yachts of foreign construction would inspire fresh and superior methods in our own practice and stimulate the trade to adapt themselves to a lower range of prices, thereby increasing their market. The present custom of tackling one little job all the year round and trying to make a living by an extravagant price is all wrong. Less profit and more sales should become the yacht builder's motto.

SOME KINKS.—When tailing to a "rode" one way of saving chafe between the line and bobstay or in the hawsepipe is to slip a short piece of ordinary garden hose over the line, and after letting go shove it up on the rope in wake of the chafe. A good fender can be made out of any rubber hose. Cut length to suit, stuff with fine sand, after reeving a lanyard through. Seize up the bottom and top by hitching the ends of the lanyard about the hose, or close in any other manner. Both these handy arrangements have been brought into use by Mr. Arthur Edwards of Chicago, who is now having a yacht built on the Windward's lines by Powell & Douglas, Waukegan, Ill.

BOSTON.—Mr. Geo. M. Winslow of Boston (owner of the sloop Aswell, lately the Henry Butler), is now having built by James & Son of Essex, a centerboard schooner which will be enrolled in the Boston Y. C. Her length over all is 65ft., waterline 58ft. 6in. Her mainmast will be 49ft. deck to hounds, foremast 47ft., mastheads 6ft., maintopmast 31ft., bowsprit outboard 17ft., flying jibboom, cap to stay, 14ft. Her sails, by McManus of Boston, will measure 5,800 sq. ft.... The catboat Awilda, built by Crosby in 1883, and owned by Captain Stevens, of Onset, has been sold to Messrs. Farrell and Rich of Boston, and will be sailed under the flag of the South Boston Y. C. The Awilda is 25ft. long and 11ft. 6in. beam.... Nebula, the cruising cutter now building at Lawley & Son's north yard, City Point, for Mr. C. W. Jones, of the Boston Yacht Club, is rapidly approaching completion. She appears to be an able sea-going craft, with fine lines which would indicate speed. Her waterline measurement is 35ft.; over all, 43ft. 6in. Spars—Bowsprit outboard 22ft., stem to center of mast 14ft. 6in.; mast, deck to hounds 33ft. 6in., masthead 6ft.; topmast, fid to truck 32ft. 6in., mainboom 38ft., maingaff 28ft., gaff topsail yard 28 ft. She will spread 2,000 sq. ft. in her working sails, 2,500 sq. ft. in light kites. McManus & Son, of Boston, are to furnish the "dinity."

NEW BOATS IN BOSTON.—Messrs. Wood Bros., of Jeffries Point, South Boston, have in hand two new yachts, one a centerboard sloop for New York parties, 27ft. long, 10ft. beam, 3ft. 4in. depth of hold, and 2ft. 4in. draft, with a board 10ft. long. Her spars are as follows: Mast, deck to hounds, 24ft. 6in., boom 25ft., gaff 20ft., bowsprit outboard 10ft., topmast 20ft. The area of her lower sails will be 660 sq. ft. The topmast will be fitted to house. The frame is of white oak, plank of cedar, and deck of narrow pine, laid with the sideline. Her lead keel weighs 2,560 pounds, and is fastened with copper bolts. The cabin, cockpit and companion will be finished with hard wood. Under the cockpit, which is watertight, air tanks are fitted. The other yacht, a keel sloop, the firm are building as stock. She is 28ft. on deck, 32ft. 3in. on waterline, 12ft. beam, 6ft. 6in. depth, and 7ft. draft, with an iron keel of 8,800 pounds. Her frame is also of oak, with yellow pine planking without butts. The spars are: Mast, deck to hounds, 31ft., boom 34ft., gaff 26ft., bowsprit outboard 14ft., topmast 28ft., topsail yard 31ft. 6in., club 27ft., area 1,150 sq. ft. She will have double head rig. The headroom in cabin will be 6ft. 3in. Wood Brothers are turning out both boats in excellent style.

ORIVA.—We regret to hear that Mr. C. S. Lee intends to be absent this season in Europe, thereby depriving the famous Oriva of a skipper who knew so well how to tool a craft to victory. Oriva will in consequence change hands and for her sake we hope she may come into the possession of one who will prove a worthy successor at her helm. Oriva is cock of the walk in her class and the smartest of her loadline afloat in American waters. As a "comfortable" cruising craft she is unexcelled, with more liberal accommodations and arrangements for shipboard life than centerboard sloops of much greater size. The safety and great ability of Oriva are also considerations in her favor as a vessel well suited for family cruising.

DEATH OF A NEW YORK YACHTSMAN.—Mr. R. S. Elliott, the owner of the schooner Fleetwing, died suddenly at his residence in New York on Feb. 13. Mr. Elliott had been a member of the New York Y. C. for the past ten years. He had intended to sail on a cruise to the West Indies in a short time, and the Fleetwing was to have been in New York next week to make the final preparations for her cruise.

SMALL CRUISING YACHTS.—Pittsburgh, Feb. 11.—*Editor Forest and Stream:* Will Mr. W. P. Chadwick, or some one who knows, give the readers of the FOREST AND STREAM the points for a boat for coast and between island cruising that will be comfortable, handy and safe for a summer cruise for three or four persons, and greatly oblige others and W. H. WINSLOW.

OCEAN QUEEN.—Messrs. Poillon are now laying down Mr. Bush's new schooner, from the model furnished by Messrs. Smith & Terry, of Greenport, L. I., and will stretch the keel as soon as the steam yacht Cora is launched, which will be early in March.

A NEW YACHT CLUB IN CHICAGO.—The Phœnix Y. C., of Chicago, was organized on Jan. 23, with Mr. J. M. Bradley as commodore.

"AHOI!"—We have received the first quarterly number for 1885 of the *Ahoi!* a German yachting magazine, published in Potsdam.

Canoeing.

FIXTURES.

March 3—K. C. C. Camp-fire, 106 West Forty-second street, 8 P. M.
March 17—K. C. C. Camp-fire, 106 West Forty-second street, 8 P. M.
March 31—K. C. C. Camp-fire, 106 West Forty-second street, 8 P. M.
May 30, 31—Hudson River Meet.
July —Western Meet, Ballast Island, Lake Erie.
July 24 to Aug. 8—A. C. A. Meet, Grindstone Island.

THE WESTERN MEET.

Editor Forest and Stream:

Chautauqua Lake has been suggested as a suitable place for a canoe meet, and I think if its location could be declared satisfactory as a compromise by Eastern and Western canoeists, the lake would be found about all that is desirable for the purpose. It is eighteen miles in length, extending in a northwesterly and southeasterly direction. Its breadth is three miles in the widest places. At the middle it narrows to one-fourth of a mile in width. Philologists have claimed that the original meaning of the word Chautauqua is "a bag-tied-in-the-middle," which is a very good illustration of the shape of the lake. It is indented by picturesque points, and bordered by fine scenery. The shores abound in good camping places. The lake is very popular as a summer resort. It is situated in extreme Western New York and may be reached at Mayville, at its head, by the B. W. Y. & P. Railroad, and at Jamestown and Lakewood, near the foot, by the N. Y. P. & O. Canoeists who have visited this lake seem to be favorably impressed. J. M. E.

SINCLAIRVILLE, N. Y., Feb. 14.

[The Cleveland C. C., who have the matter in hand, have decided on Put-in-Bay Islands as the location of the meet, being accessible to yachts as well as canoes, and a more central location, as the other is too far from Chicago, Minneapolis and other Western cities. Chautauqua Lake has been proposed as a lcation for a local meet. Why will not J. M. E. and others near by push the matter?]

THE BROOKLYN "ALLIGATORS."

Editor Forest and Stream:

I wish to accept your invitation to report the proceedings of our club, "The Brooklyn," and take pleasure in informing you of the steps we have thus far taken and of our policy. The Brooklyn Canoe and Sailing Club by its constitution and by-laws provides that gentlemen over twenty years of age are eligible to membership, and on a vote being taken and the payment of ten dollars initiation fee and a quarter's dues, viz., three dollars, are constituted such. The officers of our club consist of a president, vice-president, a commodore and secretary, and two standing committees of three members each, known as the house and the regatta committees. The first of these is appointed by the president, the second by the commodore, and these two officers are ex-officio members of the committees. We intend during the winter months to have entertainments and meetings of a social nature, but of course always in the interest of canoeing or single-handed cruising, and in this way we expect to keep up the interest of our present members and recruit many others. In the open season we will endeavor to have cruises arranged so that every Saturday or perhaps every other Saturday a fleet will go on a short two days' cruise either up the Kills into Newark Bay, down to Sheepshead Bay, or around Staten Island. On other days we hope to have races among the members or with our neighboring clubs, but this we think will be second in thought to the cruising. We are young yet, only having seen light first on January 13 of this year, but we hope to have six men at the Newburgh camp and a representation at Grindstone. It is being arranged to cruise in fleet home from the A. C. A. camp, and in this way we expect to pass an enjoyable summer.

Our boat house, which we anticipate locating on the Bay Bidge shore, will provide accommodations for perhaps thirty members, and at present we are not desirous of increasing to a larger number although we feel we would have no trouble in doing so if we felt so disposed. Our present membership is ten and we are to consider at our next meeting the application of four others. In an excellent article by Mr. C. P. Kunhardt a few weeks ago, you showed the advantages to be gained by joining with the sneakbox and other single-handed cruising men, so it will not be necessary for me to touch on that. Our burgee is of course pointed 12x18 inches and has three longitudinal stripes red, white and blue converging to the point. This we feel is appropriate and as Brooklyn is a Dutch city, the merchant flag of Holland is proper for our signal, besides we also work in our national colors. Our fleet at present consists of nine Class B boats, among which is the Sunbeam, of which much is expected, the Guenn, known favorably, the Whim, Minx, and Pilgrim, and we have one sloop, Mr. Averill's Hilda. Our full board of officers and committees for 1885 is as follows: President, J. H. Hull; Vice-President, J. F. Newman; Commodore, R. J. Wilkins; Secretary, M. V. Brokaw. House Committee, Wm. J. Root, Thomas J. Budington and Charles Gould, and Regatta Committee, H. R. Averill, Frederick Read and Thomas G. Budington. We have decided upon an alligator as our totum, and a gilded one attends every meeting. With these prospects and plans the Brooklyn Club slides off the ways into deep water, and fully launched, its designers, builders, promoters, captain and crew anticipate for it a prosperous voyage for many years.

TIP TOP.

CANOEING IN PHILADELPHIA.

Editor Forest and Stream:

In your issue of Jan. 29, appeared an article on the scarcity of canoe clubs in Brooklyn.

A like conundrum has often puzzled me. "Why has not Philadelphia a good canoe club?" We have plenty of boat clubs of all kinds, yacht clubs, rowing clubs, and all kinds of boating clubs, but no canoe club. I think Philadelphia has just as good canoeing waters as the best canoe clubs in the United States; the Delaware is seldom without a breeze (as I found to my sorrow in the past season) and affords good sailing ground; and the Schuylkill will satisfy the most unreasonable lover of a quiet paddling stream, yet we have no canoe club. At least, not yet; but another canoeist and myself have been talking the matter over among our friends, and four or five of us will probably help to fill the ranks of any canoe club that may be started here. I respectfully invite correspondence on this subject from any canoeist residing in or near Philadelphia.

PHILADELPHIA, Feb. 14, 1885. THOS. W. BLUETT.

[There is already a canoe club in Philadelphia, the purser of which is Mr. T. W. Westcott, 2129 Spring Garden street, but we hear little of their work. Perhaps there is room for another club and any desiring to join in forming one can address our correspondent.]

A CRUISING BOAT FOR "KANUCK."

Editor Forest and Stream:

"Kanuck" inquires in your last issue for a good and safe sailing cruiser. As he is on the seashore, where he will have no carries to make, let me advise him by all means to get that safest, most comfortable and home-like craft for one or two cruisers, the sneakbox. The sneakbox is practically uncapsizable, beats to windward like a catboat, has room enough to allow a frequent change of position, can be slept in by two persons with more comfort than one will enjoy in a canoe, can easily be fitted with a roomy waterproof canvas cabin, and will stand severe usage that would ruin a canoe instanter.

Captain George Bogart, of Manahawkin, Ocean county, N. J., builds an improved sneakbox for cruising purposes that is better suited for rough waters than the gunning sneakbox. He makes a 14ft. box with all improvements for $35, I believe, or a 12ft. box for one person, for $65. J. F. Kilpatrick, of Barnegat, N. J., makes the gunning sneakbox for a little less money, and J. H. Rushton, of Canton, N. Y., makes a gunning box of a lighter build and finer lines than the original kind, for a trifle more money than Bogart charges. "Kanuck" can get full information about sneakboxes by writing to N. H. Bishop, Lake George, Warren county, N. Y. SENECA.

THE LAKE ERIE MEET.

THE Cleveland canoe and yacht clubs have united in the management of the meet at Put-in-Bay Islands, and will undertake all the arrangements. They have prepared the following circular, which will be sent to all canoeists in the United States and Canada. Their desire is to bring together as many canoeists, yachtsmen, and other boating men from parts of the country, as is possible, for two weeks of pleasant camping and sailing, and all are invited, whether members of any club or association or whether unattached. At the meeting some schemes for a permanent organization may be discussed, but as yet nothing has been done in the matter. To the end that all who come may be free to enjoy every moment of his or her stay, the Cleveland Club has determined to take upon itself all the preparation for the comfort and pleasure of those who come, and as there are veteran cruisers and campers in the club, no fears need be entertained on that score. But what has seemed of more importance to canoeing interests, it has been decided to extend the invitations to individual canoers, without any reference whatever to their association or club affiliation, and the Cleveland Club does not wish even remotely to forestall any action which may be taken on the occasion, especially not with reference to the formation of any association, either independent or as a branch of the A. C. A.

To American Canoers:

For some months past the Cleveland C. C. has had under consideration the practicability of a canoe meet at the Lake Erie Islands, located sixty miles west of this city.

It was first the intent to call together none but Western and Southern canoers, with the view to a formation of a Western association; but after a careful and conservative consideration of the situation, and with a desire to cultivate rather than disturb the amenities which do now and should continue to exist between all canoers, without reference to locality or other conditions, it has been determined to extend the invitation to be present to every canoer in North America, whether he be a member of the American Association or of a local club, or entirely unaffiliated. The invitation will be extended also to all lady canoers, and special arrangements conducive to their pleasure and comfort will be made.

The project was brought before the club at a special meeting called for that purpose held on Jan. 17. The proposition was unanimously acceded to, and temporary officers and committees were selected.

The Cleveland Club, after mature deliberation, deemed it the wiser course to assume the entire direction and responsibility than to undertake to name officers or committee men from other organizations, and thus become involved in an interminable correspondence. The local committees will make all arrangements for the meet, prepare a schedule of races, provide prizes, select the camp, survey a course, arrange an order of business for a business meeting, secure the best attainable rates of transportation, secure hotel and cottage accommodations for such as want them, and in fact do everything possible for the success of the occasion.

The programme of races will be made subject to the approval of an assembly meeting to be held on the first day of the meet, when such other action as may be deemed desirable may be had.

The question of a permanent organization will be presented at the first assembly and considered at subsequent meetings, if necessary, until disposed of. Canoers are especially requested to come prepared to express their views on this subject, and letters and communications directed to the president or secretary in advance will receive attention.

Every effort will be made to secure advantageous rates and safe and quick carriage of canoes to and from the meet. In order to do this the secretary should be notified promptly by all who expect to attend. This is an important matter and the notification should not be postponed too long.

The canoers' camp will be located on Ballast Island. Suitable docks and landing places will be provided and abundant boat-house accommodation furnished. Fuel, straw and ice will be on the grounds. The superintendent of camp will employ a day and night watchman to guard the camp against fire or accident.

The grounds are delightfully located on a high bluff in the midst of a shady grove, nicely kept and overlooking the landing.

Arrangements will be made for providing meals at a low rate for those who do not care to do their own cooking. The Club House, located on Ballast Island, or the Beebe House on Put-in-Bay Island, two miles distant, will afford those desiring to live *en regale* the best in the land.

Special arrangements will be made for such as may apply to the secretary for hotel accommodations either on Ballast or Put-in-Bay Islands, or for the occupancy of club cottages.

Regular lines of steamers ply between the Islands, Cleveland, Sandusky, Toledo and Detroit, and numberless excursions will be made to and from the Islands to the lake ports. A number of steam yachts and launches pass hourly to and from the various points of interest in and about the Islands.

A semi-daily mail departs and arrives. Telegraphic communication is had by cable with the outside world.

The evening's hops and parties at Beebe's and at Wehrle's, on Middle Bass Island will afford ample opportunities for those desiring such recreation.

Every necessity and luxury for the mess chest can be purchased on the ground.

For short cruising trips the waters around about the Islands are all that could possibly be desired.

The Cleveland Yachting Association has prepared and will issue a circular invitation to all yacht clubs on the chain of lakes to meet at the Islands on the dates fixed for the canoe meet, there to form a Lake Yachting Association. Steam and sailing yacht regattas will be sailed for the championship of the lakes and other prizes.

Arrangements are also being instituted for rowing races.

A pound boat sailing race, row boat races and tub races will also be arranged. It is, in fact, the aim of the local committees to make of this the greatest aquatic carnival ever held in the West.

The committees of the several organizations are working in harmony, and the entire programme will be arranged to avoid interference, one with the other.

The committee has in process of preparation a bulletin, which will contain the entire programme for the meet, railway time tables, steamboat schedules and other information which, when printed, will be furnished on application.

The date of the island meet will be fixed with particular reference to the accommodation of those who wish to attend the meeting of the American Canoe Association, and arrangements will be made to carry members and their canoes by water at reduced rates directly from the islands to the St. Lawrence. Parties expecting to go to the A. C. A. meet direct from the islands should inform the committee of such intention in order that the arrangements may be made.

It is intended that this circular shall reach every canoer in the United States and Canada, and the committee will be under obligation to any one who will furnish the address of canoers who are not members of the A. C. A. All communication should be addressed to G. Harry Gardner, secretary, 472 Euclid avenue, Cleveland, O.

Officers and committees of the canoe club appointed for the meet of 1885: President, Geo. W. Gardner; Vice-Presidents, W. Scott Robison, Charles H. Comstock; Secretary, G. Harry Gardner; Treasurer, Robert F. Jones; Surveyor, Fred Keith; Superintendent of Camp, W. H. Eckman; Regatta Committee—Fred Keith, Ed. S. Wright, C. H. Comstock; Reception Committee—Will E. Lewis, G. Harry Gardner, Geo. Johnson, C. H. Comstock. Ed. S. Wright, Fred Keith, W. H. Eckman, R. F. Jones, W. S. Robison; Banquet Committee—W. H. Eckman, G. Harry Gardner, N. P. McKean, Jas. Gibbons.

Further information will be found in our yachting columns.

HOMEWARD FROM STONY LAKE.

IT was late in August and the meet of '83 was ended when we started on our homeward voyage, with the good wishes of our jovial Canadian brethren, who gathered on the shore of Juniper Isle to bid us bon-voyage. Thinking it best for camping purposes, we paired off as follows: Bob and Charley, Wad and O. L., Mac and Petie, Doc and Friday. Doc, by universal consent, was elected commander of the fleet, all other distinctions being dropped.

Starting with a stiff breeze on the beam, we had a glorious run to Young's Point, accompanied part of the way by Commodore Edwards, who, ever genial and courteous, wished to see us well started on our cruise. Contrary to our resolution not to "cruise in hotels," we dined at the only hotel in Young's Point, and thence proceeded under paddle to Lakefield, where we spent the night in a hotel. After portaging by rail to Peterborough, and performing several social and gastronomic duties, we launched our canoes from the float of the P. B. C. house and started down the Otonobee River with a good spruce breeze of our own, varying the monotony of paddling by fighting a log-jam or two.

Our first camp was situated twelve miles from Peterborough, in a little wood close by the river. No tents were pitched. After supper and one or two short yarns, each man rolled himself up in his blanket and took the most comfortable position he could find. Sleep did not immediately follow, however, as some wretched cow persisted in tramping around the camp, and the dingle, dingle of the bell strung round her neck was not soothing to the nerves of the eight tired voyagers, who finally managed to drive her off.

We had barely gone three miles the next morning when we found we must go ashore and set up a hospital for one of the force, who was ill. After resting in the shade for a while and eating some lunch, the plucky fellow determined not to detain the fleet any longer. Setting sail we glided onward around the twists and turns of the beautiful river toward its mouth, where, as we had expected, we passed the camp of the Mohican Club. Running out into Rice Lake our canoes created quite a sensation among the crew of a cutter, who changed her course and ran close up to us to see what these fancy little craft were like. Going ashore on Sheep Island, we pitched our camp on the top of quite a hill and prepared to pass a cool night.

Paddling three miles through the crisp morning air to Harwood, we shipped Bob, Charley and their two canoes off by rail, wishing them good-bye with three rousing cheers. After buying some provisions we continued our voyage, spending a delightful summer's day alternately sailing and paddling, there being just wind enough in the afternoon to warrant keeping the canvas spread and just not enough to allow each of us to literally keep our watch below and doze away the time.

Entering the Trent River at about 5 P. M., we began to look about for a camp ground, and finally pitched on a spot about four miles above Hastings, where we proposed to take the railroad and portage around the Nine Miles Rapids.

We reached Hastings the next morning just as the train for Belleville, on Bay of Quinte, was about to start. Doc's glib tongue, however, obtained a delay of ten minutes. We went to work, and in eight minutes we had gone ashore, dragged the canoes out of water, carried them over a steep embankment, and placed them in the car under lock and key.

Reaching Belleville at about midday, we had the first, and with one exception, only experience of the fact that a very few Canadians could be rude. We nevertheless, enjoyed a good table d'hote dinner at the best hotel in the place for the moderate sum of fifty cents. After buying some provisions, we went down to the railroad wharf, where we all launched our canoes except Mac and Petie, whose vacations were nearly finished, and consequently they had to go home by a quicker route. Bidding them good-bye, we started to paddle through a drizzling rain, against a chop sea and head wind, to a point about two miles distant. We arrived soaking wet (except the man who had oil skins) and pitched our tents. Then, ah! the warm, grateful feeling of being in dry clothing again after a good rub down with a rough towel. But our cup of bliss was full to overflowing when, after a warm supper and hot coffee, we rolled ourselves in our blankets, and prepared to read an hour or so before "turning in."

"Well, Friday, what do you say to starting?" quoth Doc, at 9 A. M. next morning.

"I say if there is anything I dislike it is paddling through a cold, drizzling rain," was the sleepy answer.

"Correct," came from the other side of the tent, followed by a snore.

"Thank goodness! we are to stay in camp all day," thought Friday, with a sigh of relief as he rolled over.

Obtaining a good, though rather late start the next morning, we had a beautiful run through the bay, passing by two wrecks, which plainly showed that the then placid waters could become stormy when Old Boreas wished to make himself felt. Reaching Deseronto about 4 P. M., we were received with open arms by the Rathbuns. After parting with "O. L.," who wished to go ahead, stowing our canoes in the freight house of the steamboat company and taking our traps to the village inn, we proceeded to enjoy the royal hospitality for which our hosts had become so noted while at the meet. Before leaving our "better halves" we agreed with the steamboat agent to be on hand the next morning at 7 o'clock to load our canoes on the steamer for Kingston.

Seven A. M. found us "all thar," but the canoes were gone! After diligent inquiry we found that the steamer, which ran further up the bay to Belleville, had stopped during the night for freight, and as such our canoes had been put aboard.

Seven-ten saw us quiet, 7:15 saw us impatient, 7:20 saw us quietly angry, 7:25 saw us furious, and 7:30 saw the sidewheel steamer Hero come puffing up to the dock half an hour behind hand.

The first thing that met our horrified gaze on jumping aboard was the three precious canoes all piled up in a heap, with a couple of dozen window frames by way of covering! At first we stood aghast, all sorts of doleful thoughts passing through our several minds. Then our anger and indignation arose, and under the leadership of the valiant Doc we proceeded to "blow up" the deckhands, whose impudence increased in the same ratio as our indignation. We finally appealed to the captain, who ordered the deckhands to remove the window frames and we stowed away the canoes to our satisfaction, and the damages, although less than we had anticipated, were more than we wanted.

Before reaching Kingston we decided to continue our trip on the steamboat to Clayton, where we had the pleasure of meeting two jovial members of the fraternity also on their way home from the meet but, alas, by another route. They, however, had time to expatiate on the beauties of the Thousand Islands, and in consequence we were anxious to get well in among them.

After buying some provisions and bidding farewell to our friends, we set sail and had a very pleasant ten mile run through the islands. Heading our canoes into a beautiful little cove, we landed on the rocks, which were low and almost perpendicular, thus forming an excellent wharf, and prepared for an early supper. That night Friday was awakened by sounds of distress coming from the outside of the tent, and on reconnoitering found poor Doc suffering from the effects of lead-poisoning, which had probably been caused by eating canned corned beef. Some medicine having been administered with apparent good effect, Friday returned to his blankets and was soon sound asleep. Here a word about canned meats. The writer personally knew two men who were made ill by eating them. If you must eat this kind of "grub," let the parts that have been near the tin alone. The next morning dawned bright and cheerful, but it was decided not to break camp that day in order that the sick man might be allowed to regain his strength.

Turning out early on the day following, our "Sunday," as we termed it, we determined to make a good run to compensate for lost time, so starting under full sail, with a slight breeze, we half drifted to the Thousand Island House, where we mailed our letters and Wad and Friday bought some very bad and strictly American candy.

Starting well out in Alexandria Bay we soon found that the wind was steadily increasing, and when we started again after lunch, from a point at the lower end of Alexandria Bay, we had nearly if not quite half a gale blowing directly over the sterns of our canoes, which

with sails spread wing and wing, seemed to jump from the top of one wave to the crest of another, as if playing leap-frog, the smaller canoes often varying the sport by poking their noses under in the most disagreeable way.

Although the sailing was exciting and accidents seemed imminent we managed to reach an island two miles above Brockville, where we pitched our tents in great glee at our good run and at having beaten a rainstorm by about five minutes.

After a good night's rest we paddled to Brockville, twelve miles from Ogdensburg, which we wished to reach early in the afternoon so as to take the train to Rouse's Point on Lake Champlain. The wind being nearly dead ahead we continued paddling until within two miles of Ogdensburg, when setting sail and keeping close-hauled we made port without tacking, and an exciting time we had of it too, one of the squadron preferring the paddle after getting out from under the lee of the shore. The wind having changed a little, blew nearly across current and was altogether "too fresh," being both cold and strong and making a nasty sea of which the crews of the two smaller canoes received full benefit, their little craft being at times almost lost in the cold spray.

Landing in Ogdensburg we freighted the canoes and bought tickets for Rouse's Point, after Friday, who claimed that he was too wet for comfort, had changed his clothing. Passing through the many dangers of traveling on *terra firma* we reached Rouse's Point at 8 P. M., and stowing away the canoes in a freight house, proceeded to enjoy the hospitalities of the Massachusetts House.

"Come Friday and Wad, turn out, we have plenty of hard work before us to-day," cried Doc, the next morning at 7 A. M., but as a prophet he was a failure, for the hardest work done that day was to oversee the carting of the canoes from the freight house to the beach of Lake Champlain. As a strong head wind was blowing we decided to remain in town and enjoy ourselves in the mild dissipation of having our photographs taken and reading novels.

Starting next morning with our mainsails bellied out by a stiff westerly breeze we had a lively time of it for a while, but after going some three miles it was unanimously decided to set mizzens as mainsails, and even then crossing the mouths of the numerous deep bays was rather rough sailing, not rendered over-enjoyable by the cold, cutting wind. As usual, however, the old cruiser soon had his oil-skins on, and sarcastically asked if it wasn't a pretty good scheme to have a canoe large enough to accommodate a suit of waterproofs besides the usual duffle for summer cruising. Camp was pitched that night about three miles above Plattsburg, after having made nearly twenty-five miles under mizzens.

After breakfast the next day we launched our canoes into a short angry sea from off a ledge of rocks upon which grew a small green plant that made them so slippery it was almost impossible to stand, to say nothing of wrestling with the canoes with the miniature breakers trying to knock us over. Paddling to Plattsburg against the sea and wind was sharp work while it lasted, and was the last "paddle" of the cruise for poor Wad, whose vacation had expired.

After making arrangements for the Nettie and seeing her safely started on her journey, we enjoyed the kind hospitality of a friend of Doc's. Parting with Wad on the pier with many mutual promises to meet again at no distant date, the fleet, now reduced to Doc and Friday, paddled away from Plattsburg. Stopping about three miles from town, Doc put forth his ingenuity and successfully repaired one of Friday's spars. Continuing to paddle for a couple of miles, camp was pitched opposite Valcour Light and supper eaten without certain piscatorial additions which Doc had promised Friday, and which he had vainly endeavored to obtain by trolling over some celebrated fishing grounds.

Next morning we paddled and sailed to Port Kent, where, as Doc was in a hurry and Friday refused to cruise alone, arrangements were made to take the steamer Vermont for old Ticonderoga. As we had some thirty-six hours to wait in Port Kent with nothing to do, it was decided to visit the Ausable Chasm, at whose beauties and wonders we greatly marvelled.

September 8, at 8 A. M., found us on the Vermont, which duly landed us at Ticonderoga at 12:30 P. M. Launching the canoes we sailed up the creek to the village, where we in vain sought old "Peanuts," who used to portage canoes between Lakes George and Champlain. Consoling ourselves with some dinner, we hired another man and carried our craft over to Lake George, on whose waters we were soon floating.

After passing a cold night we broke camp and paddled and sailed through a nasty chop sea to the Harbor Islands, where we camped early in the afternoon, not caring to continue on against the cold headwind and sea. For the second time during the cruise we camped without pitching the tent, sleeping instead in a shanty we found on one of the islands.

The last day of the cruise was a beautiful one, not a breath of wind ruffling the waters of the lake, the gale having completely blown itself out. Paddling onward, Doc showed Friday that pretty little cove so well named Paradise Bay, and pointed out all the other places of interest until Canoe Islands were reached. Here we had our farewell dinner, and of course it was extra fine. After "washing up" for the last time, the canoes were again started after being thoroughly overhauled, and mementos of the cruise exchanged. Paddling to Hillview, we each found some mail, after reading which it was arranged that Doc should leave his canoe with a friend living on the shore of the lake, and walk around to Caldwell to meet Friday, who should go on and ship his canoe home. The programme was carried out in every respect, Doc accompanying Friday a short way on the railroad journey, both agreeing before parting that they had had "a first rate time all around." FRIDAY.

SINGLE AND DOUBLE BLADE.

Editor Forest and Stream:

Your correspondent "Boreas" claims that the double blade has proved superior to the single blade for speed, which I deny, as the races of the Association do not prove it. In 1880, at the first meet, the user of a single blade distanced all the others, and a list of the races since will, I think, show that the majority of paddling races were won with a single paddle.

Notwithstanding the difference in their boats, the two paddlers with the single blades pushed Mr. Johnson sharply last year at times. For cruising purposes the single blade is also superior, as it is lighter and more easily handled in a wind, does not tire the arms so much, and is used in a more graceful manner than the awkward windmill swing of the double. For work in rapids and currents it is also superior, as the canoe is under more perfect control. Perhaps "Boreas," like others who condemn it, has never tried a light, elastic and well-shaped SINGLE BLADE.

Editor Forest and Stream:

In the hunt after novelties and improvements for sailing, such as drop rudders, reefing gear, centerboards and similar fittings, the canoeist's first and best friend, the paddle, is apt to be overlooked and be relegated to a back seat. Some improvements have been made in increasing the length, which has grown from 7 to 11ft., the average being perhaps 9½ft., and also in the raised seat now used; but there is little doubt that we have not yet learned all about the paddle and its use. Mr. Farnham has made a new departure in his 11ft. paddle with 4in. blades, which is worth trying thoroughly; besides which the proper position of seat (its distance from the bow) and the best height are yet undecided. There is still a large field unexplored in this direction. Why do not some of the clubs which are situated on small streams, and consequently do little sailing, take up the question in the same manner that the Mohican and New York clubs have done with sails and rigs. The tests should be made with a 30in. boat, as the size mostly used. Different lengths might be tested by making a handle about 3ft. long, with a ferrule joint in each end. Blades of various sizes and shapes could be fitted in this handle, making the length to vary from 7 to 12ft. Two Canadian single blades could be fitted, as Mr. Farnham did, and spoon blades, narrow and wide blades, short or long, could easily be tried. Seats of various heights could also be used, as the best heights for racing and cruising are yet undetermined. The average prizes will stimulate the interest in paddling, but this is not enough, as the growth and prosperity of canoeing lies in the double-bladed paddle. REX.

AN AMERICAN CANOEIST ABROAD.—In a letter from Berlin Prussia, dated Jan. 11, Mr. M. C. Smith, Commodore of the Irriwadd C. C., writes: "The capital of Prussia is not the home of canoeists, although the River Spree, with its many branches, offers many inducements to the lovers of the paddle. * * * I have paddled, with Mrs. Smith's assistance, on the Thames from Oxford to Caversham, on the beautiful Moselle from Trier to Koblenz, 150 miles, and on the Neckar from Eberbach to Heidelberg, besides short spurts on English and Scotch lakes. While in England I saw no canoe superior to our American make, and the cost was about the same. In fact I was surprised to find numerous Canadian canoes in British waters."

A SPRING MEET IN CANADA.—The success of the local meets of last year has brought them into general notice, and now Canada is falling into line. A meeting of the Ottawa C. C. was held on Jan. 27 to discuss the question of building a new club house, and also that of a local meet in May or June, in the vicinity of Ottawa. A committee was appointed to procure plans and estimates for a house. Dechene Lake was suggested as a camp site, and the Toronto, Peterboro and other Canadian canoe clubs will be invited to coöperate. Such a camp will undoubtedly tend to unite Canadian canoeists, and to bring in many new converts.

FLORIDA.—Mr. and Mrs. Munroe are now located at Arlington, five miles below Jacksonville, and Psyche is running regularly as mail boat to Jacksonville and back every afternoon, conveying letters and supplies for the settlement. Dot arrived on Feb. 2.

SPRINGFIELD C. C.—Com. Foote has ordered a new canoe, St. Lawrence model, and Messrs. Nickerson and Shedd will order new boats soon. Mr. Joyner has been at Springfield and will build a new craft for one of the club.

SAN FRANCISCO.—The canoeists at Oakland are enjoying their season, cruising, sailing and camping out. Their numbers are increasing, and canoeing promises to become as much a fixture on the Pacific as it is in the East.

A CRUISING COMPANION WANTED.—Mr. E. G. Rand, Mohican C. C., wishes a companion for a cruise among the Bermudas about March 15. His address is 175 Tremont street, Boston, Mass.

WARREN C. C.—This club are discussing a meet in May or June at Lake Chatauqua, in connection with Buffalo, Rochester and Pittsburgh.

CANOE FOR SALE.—We call attention to the canoe advertised for sale in another column, by Mr. C. W. Shedd.

OVER SEVENTEEN THOUSAND MEN were paid cash benefits in 1883 by the Travelers Insurance Company, of Hartford, Conn., for losses by accidental death and disabling injury.—*Adv.*

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

For the Cure of all diseases of

Horses, Cattle, Sheep

DOGS, HOGS, POULTRY.

Used successfully for 20 years by Farmers, Stockbreeders, Horse R.R., &c.

Endorsed & used by the U.S. Governm't.

Pamphlets & Charts sent free.

HUMPHREYS' MEDICINE CO.,

109 Fulton St., New York.

Humphreys' Homeopathic

Specific No. 28

In use 30 years. The only successful remedy for

Nervous Debility, Vital Weakness,

and Prostration, from over-work or other causes. $1 per vial, or 5 vials and large vial powder, for $5. SOLD BY DRUGGISTS, or sent postpaid on receipt of price. Address, Humphreys' Homeopathic Medicine Co., 109 Fulton St., New York.

TO FLORIDA ANGLERS.

TRADE MARK.

Keeping fully abreast with the times, we have the last few seasons given particular attention to the manufacture and introduction of a large variety of tackle specially adapted to the needs of Florida anglers. The difficulty of obtaining natural bait at some of the best fishing grounds renders it very desirable for anglers to provide themselves with proper artificial baits. We have an unusually fine assortment of the following goods, used and recommended by expert Florida anglers:

Pearl Florida Spinners, Mottled Pearl Spoons, Pearl Squids, Pearl Mullet, Florida Bass Flies, Tackle for Channel Bass, Red Snappers, Sheepshead, Salt Water Trout, Etc., Etc. Also a New and Special Hook for Tarpum.

ABBEY & IMBRIE,

18 Vesey Street (Fourth door from Astor House), New York City.

THE INTERNATIONAL.

(REGISTERED TRADE MARK.)

LATEST IMPROVED MACHINE-MADE GUNS.

SIDE SNAPS.—Fine Twist Barrels, Rebounding Locks, Pistol Grip Stock, Patent Fore End, Double Bolt, not Extended Rib, Iron Heel Plate, right barrel cylinder-bored, left barrel choke-bored.
12-gauge, 30 or 32 inches, 8 to 9 pounds weight, - } PRICE, $30 00
10 " 32 inches, 9 to 10½ pounds weight, - - }

TOP SNAPS.—(As per cut). Fine Twist Barrels, Rebounding Locks, Pistol Grip Stock, Patent Fore End, Double Bolt, Extended Rib, Handsome Rubber Heel Plate, both barrels choke-bored.
12-gauge, 30 or 32 inches, 8 to 9 pounds weight, - } PRICE, $36 00
10 " 32 inches, 9 to 10½ pounds weight, - - }

Every component part of these guns is *made by gauge.* They are *handsome, safe and very durable, shooting qualities excellent,* and are superior in every way to any ever before offered such prices. FOR SALE BY THE TRADE GENERALLY.

HERMANN BOKER & CO., 101 & 103 Duane St., N. Y., Manufacturers' Sole Agents,

Also Sole Agents for PIFFARD'S ELASTIC RUBBER HEEL PLATES and KYNOCH'S BRASS SHELLS.

Explanatory and Suggestive.

FOR THE CASUAL READER.

Arma virumque cano—"Arms and the man I sing." And, indeed, it would take the genius of a Virgil and the roll of Latin hexameters fitly to tell the deeds of this man, whose arms are shotgun and fishing rod. Go where you will, he is there. You run into him on the crowded city street, encounter him on cars and steamboats; he perches atop the country stage, bestrides the burro, and doubles up like a jacknife in the kanim. Seek out the most distant, most tortuous streams, his line has been wet in their waters; penetrate into the wilderness, the tin can of the sportsman's camp is yet further on. He goes for game—if the fates shall send anything within reach of his ammunition; for fish—if by good fortune a trout shall rise to his fly or descend to his worm. But, good luck or bad luck, game or no game, fish or no fish—fun always, fresh air, ozone, quicker pulse beat, brighter eye, more elastic step, all the multitudinous rewards, which, after all, outweigh the biggest "bags," and tip up the longest "strings." Is it not true that only a poet could tell his deeds as they ought to be told? Perhaps so. Perhaps not. He can usually tell them himself. And he does, with a thousand different pens, in a thousand different ways.

You may read it in the FOREST AND STREAM.

And that is better than if it were put into verse between book covers.

One who does not understand these things might imagine that after being told so often, this story of the man—him with the rod and gun—might in the end become hackneyed. But it is not so. Why? Well for pretty much the same reason, we venture to say, that the fields themselves and the woods and the lakes and the streams never become hackneyed. However that may be, one thing is certain. Our columns every week, and month after month, give ample proof that there is still an abundance to tell of what is seen and what is done afield and on angling waters; and that hosts of people still delight to read the telling, our subscription books show with ever increasing emphasis. The FOREST AND STREAM is in the best sense

A Journal of Recreation.

It tells of the recreation found by busy men, in out-door, open-air life. It *is* recreation to these same men and to others. Explain it how you will, this recreation found in the pages of the FOREST AND STREAM is different from the diversion afforded by other papers. Why? Because (it may be answered again) the recreations of field and stream are always ten times more potent for good than are those found in almost any other way.

Look through the pages and you will see that the departments include a pretty large field. It is a wide scope of subjects. But if you look carefully you will see that the paper, from front cover to back cover is homogeneous. What is in it belongs in it. There is not the mistake of trying to foist upon the reader, who is interested in angling and shooting, a lot of stuff about horse racing or base ball or prize fights. There is no sawdust-ring odor. Everything is redolent of the woods. There are plenty of other papers devoted to the other subjects. If you are interested in them, you need hardly spend time to read the rest of this explanatory advertisement. The FOREST AND STREAM'S field is broad, but it is not broad enough to take in all creation. The editors are perfectly contented with the scope of the paper as it is at present. And now

A Word About 1885.

For fifty-two weeks of the year 1885 we propose to publish the FOREST AND STREAM, and to fill each number with the same rich abundance and variety of reading that may be found in this present number or in any one of the five hundred numbers that have gone before it.

There will be the same delightful accounts of the adventures and misadventures of the *Sportsman Tourist*, and whether the "tour" be across a continent or only across the pasture lot into the woods beyond, the story in either case will be well worth the time it takes to read it. We shall have, now and then, a description of such excursions in foreign lands, but for the most part these columns will deal with what is seen and done in our own country, for that, after all, is what the readers of FOREST AND STREAM are rightly presumed to be most interested in.

The *Natural History* columns will give attention to varied forms of animal life, more particularly such as may come under the observation of sportsmen in their rambles. This department of the FOREST AND STREAM we believe to hold a place altogether unique. It is neither the dime-museum sort of un-natural history affected by the newspapers, nor the abstruse, fine-spun and terribly dry lucubrations of the scientific associations. It is intelligent talk about animal life, intended for intelligent readers.

In the *Shooting* and *Angling* columns (we need hardly say it) will be accounts of hunting excursions and fishing trips—with luck, good, bad and indifferent; discussions about matters mechanical, ethical, sentimental, fanciful and practical; some, after much debating, will be settled; others will be left (and the reader with them) at the end just where they were at the beginning.

The *Kennel* will give in 1885 (as it has given in 1884) the earliest, most accurate and the only unbiased reports of shows and trials, and it will be the endeavor of the editors to maintain for the FOREST AND STREAM in this special branch the position it now holds away in advance of anything else published in this country.

The *Yachting* columns are in charge of an expert, whose highest ambition will be to keep these departments in the place already won for them in the recognized lead of journalism. Though the *Canoeing* interest of the country is of comparatively recent growth, the FOREST AND STREAM fully appreciating its importance, has provided for those who sail or paddle a (pretty generous) corner, which is so full of practical suggestions and recountings of cruising experiences, that a canoeist might almost as well try to get along without a paddle as without the paper in his mail every week.

In a word—this is what we started out to say—in 1885 the FOREST AND STREAM will be newsy, bright, wholesome—a journal of out-door recreation.

Terms:—$4 per year, $2 six mos., 10cts. per copy. Sold everywhere. Make orders payable,

FOREST AND STREAM PUB. CO., 39 Park Row, N. Y.

THREAD-WOUND, LONG-RANGE
SHOT CARTRIDGE CASES
For muzzle and breech-loading, cylindrical and choke-bore shotguns. Made to open just short of 50, 70 and 90 yards, giving close pattern and great penetration; 10 and 12-gauge. Send for circular.
Twenty sent, postpaid, for $1.

Publications.

THE

This important work, now for the first time offered to the public, contains full life histories of all the quadrupeds of this State. These biographies are as different as possible from those too often found in scientific works; instead of being dry and dull

MAMMALS

they breathe the very fragrance of the woods and fields, and give us a close insight into the every-day life of their shy inhabitants. To the lover of nature the work commends itself by its title. The hunter will need it for the complete account it gives of the habits of the deer, the hares and the

OF

squirrels. The farmer should read it because it tells him all about his enemies, the shrews and field mice who devour his crops, and about their enemies whom he would like to protect.

NEW YORK.

This interesting work is published in two volumes, the first taking the reader from the *Carnivora* (flesheaters) to the *Cervidæ* (deer), and the second concluding the subject.

BY

C. H. MERRIAM, M.D.

The volumes are superbly gotten up and are printed in large, clear type on heavy tinted paper.

We offer a few copies for sale at the following prices: Single volumes, paper, $2 each. The two volumes, paper, $3.50. The two volumes, cloth, $5.

Forest and Stream Pub. Co.,

39 Park Row, New York.

SHORE BIRDS.

A pamphlet for those who "gun" along the shore.

TELLS OF

I. Haunts and Habits—Where the bay birds live, and what they do at home.

II. Range and Migration—Where they go to breed, and where to spend the winter.

III. A Morning Without the Birds—An episode of shore shooting.

IV. Nomenclature—A list of our American species of *Limicolæ*, with a description of each species.

V. Localities—Where to go to shoot them.

VI. Blinds and Decoys—How to shoot them after you have reached the grounds.

44 pp., paper. Price, 15 Cents.

FOR SALE.

The ever reliable river St. Marguerite, the chief tributary of the Saguenay, descending from a lake far north of Chicoutimi, and famous for its salmon and sea trout fisheries, with all the proprietor's riparian rights, is now offered for sale. The St. Marguerite is distant 15 miles from Tadousac by water, or 10 miles over land. The riparian rights cover a distance of 30 miles, which is sub-divided into six sections, 5 miles apart. At each section are erected one commodious Gothic cottage, men's house, ice house, etc., etc. Each section has the control of six to eight salmon pools. Parties desirous of forming a club to secure the rights of the above valuable salmon stream, can so arrange it whereby twenty-four rods could have equal rights and splendid sport. For further particulars apply to WILLIS RUSSELL, Proprietor, Quebec, Canada, or to Messrs. GRANT BROS., 2 Exchange Court, New York City. jan8,7t

Stud Fee, $25.00.

STUD FOX-TERRIER

Champion Raby Tyrant,

(K.C.S.B. 11,179.)

Pupped October, 1880. Weight 16½ pounds.

Raby Tyrant is a white dog, with an even marked rich black and tan head. He is a thoroughly game and stylish terrier, possessing a beautifully shaped long punishing head, with perfect drop ears, small eye, rare neck and shoulders, deep chest, well ribbed and muscular quarters, short, straight legs, excellent feet, great bone and substance, with an exceptionally hard and dense coat.

Raby Tyrant is without doubt one of the most successful terriers of the present day. He has been exhibited 67 times, 33 different judges having adjudicated upon him, and has won 47. First 10 cups and specials; 12 second and 2 third prizes. His breeding is undeniable, combining as he does the choicest and most valuable blood that can be obtained. At the stud Raby Tyrant is proving himself eminently successful.

Fee, $15.00.

ANSWERS TO CORRESPONDENTS.
PUBLISHERS' DEPARTMENT.

FLY-FISHING LONG AGO.

THE early history of fly-fishing is as obscure as the early history of man. No doubt it was practiced long before it was written about or thought worthy of an allusion in so important a thing as a book was held to be several centuries ago. Dame Berners describes a dozen flies, Oppian, Ælian and other authors allude to them, but until Cotton wrote, 1676, there was no treatise on fly-fishing worth the name. In the rare old book referred to in the fishcultural columns, "L. M." also gives us "twelve kindes of flies to angle for the trout in Sommer with other fishe." These flies are all winged ones, "to angle withall on top of the water," and of the twelve names two survive, viz., the dun and stone flies. Our correspondents who have been discussing the vagaries of fly nomenclature should read the reprint of Mascall's book. Before he comes to his list of flies he commends the stone fly for trout, but whether the natural insect or its counterfeit he does not say.

We have no means of knowing how the flies used by Cotton would compare with those made to-day, in points of neatness and serviceability, but we know that the rods he used would be considered unwieldly now, and neither he nor Walton knew the use of a reel. As near as we can find out the line was tied to the tip of the rod—the old plates indicate this—and Cotton tells us to use a line a yard and a half or two yards longer than the rod, and the extreme length of the latter was sixteen feet. The reel existed in the time of Walton and Cotton, for they had heard of its use in salmon fishing. Walton says: "Note also, that many use to fish for a salmon with a ring of wire on the top of their rod, through which the line may run to as great a length as is needful when he is hooked. And to that end some use a wheel about the middle of their rod, or near their hand." To which he adds, "which is to be observed better by seeing one of them, than by a large demonstration of words." Evidently the reel was used in salmon fishing only, of which Walton had no experience.

Of the work of Mascall there may not be half a dozen copies of the original left, and these are beyond price, being owned by the great libraries and accessible to those only who are within reach of the collection. Collectors of angling books who are abundantly able to pay princely prices for original editions of rare works seldom find them offered for sale, and content themselves, perforce, with the low-priced reprint. A copy of "The Compleat Angler," of 1653, published at the modest price of eighteen pence, would now bring five hundred dollars or more, while copies of some of the ninety odd editions of this famous work can be bought for a slight advance on their value as paper stock.

A reader of these older fishing books cannot help noticing how boldly the writers stole from each other. There were no great collections of angling books and they had no idea of ever being found out, for it was a mere chance, as they no doubt thought, that any person who read the new book would ever see the old one to which they had access. In some cases they did not hesitate to quote bodily, without credit or mention that any other writer on angling ever lived, and in others they changed the phraseology slightly. We moderns are more adept at this and do not steal in such a bungling manner, "convey, the wise call it," but we often find ideas warmed over and so served that, while the flavoring may taste new at first, before digestion is complete we recognize an old *piece de resistance*. Notwithstanding this very human failing, there is a charm about these old writers that lay partly in their credulity concerning natural history, partly in their acceptance of the statements of their predecessors, but mainly in their simple and quaint style.

THIS IS NUMBER FOUR.

AND now marches forward the New England Kennel Club, and solemnly presents a fourth construction of Rule 8. At this rate we shall have fifteen different rules and constructions ground out to us during the year. We begin to feel tired in advance.

The New England version of Rule 8 is different from all the others, and admits into the champion class all dogs that have won a first prize in the open classes at the bench shows of any organization now recognized as a member of the A. K. C. Nothing is said about an extra champion class. This rule is an attempted interpretation of Major Taylor's construction; but it really goes back to first principles, as any one can see by referring to a premium list of a show held a few years ago. It is an endeavor to keep within A. K. C. rules, but what a failure. The interpretation of Rule 8 is justified neither by obedience to A. K. C. rules, nor by common sense, nor by public sentiment. In trying to follow out Major Taylor's directions, the club has succeeded in exposing itself to ridicule.

The further we get along the more comical it all is. The A. K. C., under the leadership of Major Taylor, flounders about most hopelessly, and shows no prospect of ever reaching firm ground.

We had hoped for better things from New England. Instead of using their own judgment, they try to follow orders. That they have not succeeded is clearly not their fault, for no man has yet been found who knows what Major Taylor meant when he "constructed" Rule 8.

The New England Kennel Club through a mistaken sense of duty have taken a course which is much to be regretted, and we should not suppose that they would feel very kindly toward Major Taylor for having placed them in so unpleasant a position.

GUN-SHY SHOOTERS.

FROM a Canadian correspondent comes an inquiry for a method to cure flinching. He says, "I have a friend who dodges back when shooting; he gives the trigger a tug, jerks the gun away from the mark, and shuts his eyes." Almost every one can recall cases of a similar nature. Gun shyness may be inherent, or it may have resulted from the use of unnecessarily heavy loads of powder and shot. If inherent it is usually much harder to overcome than when caused in the other way.

There is but one course to pursue, and that is, to persistently practice with a gun loaded with very light charges. Use powder without shot. Let the charge be so light that the gun may be discharged without a tremor. The charge may then be very gradually increased, and in the end the shooter will probably find that he can use the ordinary charges without difficulty. But whenever, with an increased charge, the nervousness returns, that charge should at once be abandoned and a lighter one substituted.

Sometimes the flinching is due to what may be termed 'bird-shyness," being due very largely to the nervous condition induced by the starting up of the game. We have known shooters who at pigeon matches killed their seven or eight birds out of every ten, and shot without flinching, but who in the field, where a quail or a grouse or a woodcock rose, invariably acted in just the manner described by our correspondent. One such flincher was completely cured in this manner. When quail hunting one day, a friend suggested that the charges of shot be withdrawn from his shells; and then the gun-shy man took deliberate aim at each bird as it rose within range, blazed away with his powder charges, never flinched, and was in each instance sure that he "could have killed that bird." Finally a shot-charged cartridge having been surreptitiously inserted, sure enough he did kill a bird; and after that found no more difficulty in shooting the usual charges.

THE DEER BILL.

MOST of the petitions for the passage of the bill forbidding deer hounding have been returned to us and forwarded to Albany. Those who still have blanks are notified that unless sent to us immediately they cannot be used.

The number of signatures and the very general representation of all classes, as shown by the names, should be sufficient proof to those at Albany that the passage of the bill is desired by the public.

Much has been done by individual effort to secure the interest and support of members of the Assembly and Senate, and much more can still be accomplished in this direction. It is individual effort that counts.

Whatever else is done or left undone in the way of New York game legislation this year, let the Curtis bill against deer hounding be made a law.

A NEW FORESTRY ASSOCIATION.—At a meeting held in Utica last Saturday, a New York State Forestry Association was formed. The new society will fill an important office if it will take charge of forestry legislation and aid the cause by disseminating information about the forests and instruct the public in forest economy. The following officers were elected: President, Andrew D. White; Vice-Presidents, Clinton L. Merriam, of Locust Grove; H. R. Lowe, of Middletown; Patrick H. Agan, of Syracuse; Patrick Barry, of Rochester; Morris K. Jessup, of New York, and John F. Seymour, of Utica; Recording Secretary, E. B. Southwick, of New York; Corresponding Secretary, S. W. Powell, of New York; Treasurer, Thomas Denoy, of New York; Executive Committee, Robert Lenox Bank, of Albany; Charles E. Whitehead, Egbert L. Viele, and T. B. Coddington, of New York; R. U. Sherman, of New Hartford; C. W. Hutchinson, of Utica; Dudley Miller, of Oswego; Roselle H. Hall, of Watertown, and Sherman S. Rogers, of Buffalo.

THE MICHIGAN ASSOCIATION met last week and adopted a bill to be introduced into the Legislature providing for the appointment of a State game warden. Sportsmen who are residents of that State and others would be glad to see such an officer appointed. It is high time that the burden of game protection in Michigan be assumed by the State. The lawmakers at Lansing are behind the age. Every State that fails to make due provision for enforcing the game laws is behind the age. Other natural resources are appreciated, but the Solons of the day appear oblivious of the fact that large game in a State like Michigan is of any account; so it is given over to the pot-hunters, who slaughter it when and how they please, and ship it to the Chicago and St. Louis and New York markets.

A VALUED GIFT.—We have received from Dr. E. Sterling, of Cleveland, O., a copy of the late Dr. Theodatus Garlick's "Treatise on the Artifical Propagation of Certain Kinds of Fish," being a presentation from Dr. Garlick to Dr. Sterling. Facing the title page is a photograph of Dr. Garlick, taken in 1858; and interleaved are some of the printed papers written by Dr. Garlick in defense of his claim to having been the first person on this continent to breed fish by artificial fecundation.

A. K. R.—Two thousand one hundred and thirteen dogs have the right to the designation A. K. R. and a number after their names. The *Register* has been issued every month, is issued every month, and will be issued every month. It is doing a most excellent service, because it provides a current, reliable, and more and more complete chronicle of just the records that dog owners want to have at their elbows.

The Cincinnati Zoological Gardens.—We learn with great regret that Mr. Frank J. Thompson has resigned his position as superintendent of the Zoological Gardens at Cincinnati. Mr. Thompson's great interest in zoology, his experience, covering a long period of years and many lands, and his habits of close observation have made him invaluable in the position he has so long occupied. The gardens at Cincinnati being deprived of his services, suffer a loss which is most serious to them. Our regret at his giving up this position is at the loss which his resignation will be to science. Mr. Thompson's observations on the habits of wild animals in confinement have been of very great value. Many of our readers will remember his interesting paper on the birth of the young sea lion at the Cincinnati Gardens, which appeared some years ago in Forest and Stream and was afterward quoted by Mr. J. A. Allen in his monograph of the *Pinnepedia*, as the only authentic information on the subject. This was but one of many valuable papers which have been contributed by Mr. Thompson to the scanty literature of this most interesting subject. It is a serious misfortune that one who has done so much for science and is abundantly qualified to do so much more, should feel obliged to withdraw from a position where his opportunities for observation are so great.

The Cuvier Club's Bill of Fare, on the occasion of the annual reception the other evening embraced, according to a Cincinnati paper, "Rocky Mountain black-tailed deer—one hundred and fifty pounds of saddle and loin. This delicacy was procured through a little subterfuge from Denver. On account of the growing scarcity of this species of deer, a Colorado State law prohibits its exportation. In Denver the ordinary venison costs six cents a pound and 'black-tail' thirty." We indulge the hope that this report may prove to be erroneous. It would be in exceedingly bad taste for a society like the Cuvier Club to make a jest of the Colorado game laws in this way.

Columbia County, N. Y., has a wide-awake game club with headquarters at Hudson. It does not confine its activity to telling what ought to be done, but sets out and does it. There ought to be a hundred more clubs just like it in this State, and an equal number in every State in the Union.

President Arthur proposes to make an extended angling tour next summer.

Never Roll Manuscript. Always Fold It.

THROUGH TWO-OCEAN PASS.

V.—THE PACK TRAIN.

THE little company of five individuals which left the lake had with them thirteen animals. Of these five were horses and the remainder mules. Each one of these animals had its own peculiar characteristics, and as on these depended in no small degree the comfort of the travelers whose journeyings are to be the subject of this narrative, it seems but fair that they should be introduced to the reader. Courtesy to the higher race demands that the horses should come first, though the mules are really the more interesting beasts.

Dandy, Mr. Hague's mount, was a bright bay American horse, and a fine free animal, easy-gaited, and rather remarkable for the swiftness of his trot. He had been brought from the East only a year before, and being new to the country, was somewhat clumsy about climbing among the rocks and going through the down timber. For the same reason he was apt to do rather stupid things, and often got tangled up in his picket rope, or stepped on and broke his bridle rein, when it was thrown over his head, and he was left to graze without being fastened, things which a plains-bred horse never does.

Something has already been said about Pinto. He was a broncho, about fourteen and a half hands high, well put together and strong. His gaits were easy, his walk a fast one, and his endurance great. If he had a fault, it was a habit of stopping, putting down his head and arching his back, when he was urged to go where he did not want to, which made one imagine that he was, in the vernacular, "goin' to start in to buck." Moreover, his roached mane and white eyes gave him a wild and startled expression, which would not have been particularly reassuring to a timid rider. He never misconducted himself in any way while I rode him, except on one occasion, and then for a cause which was undoubtedly good and sufficient.

Rocket was a white-eyed buckskin ridden by Stewart, the chief packer. A great strong broncho, careful in picking his way through the down timber or among the miry places, and excellent in the lead. He was also well broken and would stand where he was left, when, as frequently happened, his rider had to jump off and run back to tighten up some pack which required attention.

Sadlemeyer's mount was an ancient white broncho called Prickly Pear, an alliterative name which fitted him admirably, for he was certainly difficult to handle, and was never so well pleased as when he was doing something to make trouble for his rider. Sometimes he would even buck, when the flank cinch was drawn more tightly than he liked, though his efforts in this direction were feeble nnd abortive, and were no less amusing to his rider than to the lookers on.

The bell mare was remarkable only for her deep-rooted aversion to the caresses which some of the mules liked to shower upon her. Most pack trains have with them a mare who carries a bell, for mules readily attach themselves to horses and mares, and seem never so well pleased as when near one of these animals. On the march they will often fight for the position next the bell, and when feeding will never wander far from it. When the herd is out at pasture the sound of the bell notifies the man, who is looking for the stock, of the position of the central figure of the herd, and the other animals will usually be found near her.

Each of the mules in our train had its own name, just as each had its own "rigging," that is, its aparejo, set of blankets and lash rope. Their eight titles were Mollie, Granny, Rooster, Belle, Star, Scissors, Hell and Little Nell. Mollie may be dismissed with the remark that she was a saddle animal ridden by the cook, who always led the bell mare. Granny was a tall, aged black mule, well intentioned, and, like many other well-meaning animals, human and brute, rather stupid. She would sometimes buck for a little after her rigging had been put on, but her pitching, like that of old Prickly, and for the same reason—because of old age—was always without result. She had an unhappy faculty for getting into trouble, was given to falling into mud holes, and was likely to attempt to go between two trees so close together that the pack would not pass between them. When once in such a position she would never back out, but would push and twist and strain in her efforts to go forward until something at length gave way. Usually one of the trees would be a small one, and her struggles would either push it to one side or bend it down, so that the pack would slip by or over the obstacle. Every one used to feel sorry for Granny when she got into any difficulty, and I really think that notwithstanding all the trouble she gave, she received almost as little cursing as any of the animals in the train.

Rooster was the jewel of the train, the animal of the most individuality of them all, and to me a delight from the first day of the trip to the last. He was a tremendously stout, well-built black animal, and was of such an independent and energetic spirit combined with so much vitality and power that he was never contented except when in action. As soon as he was saddled in the morning the spirit of rebellion broke out, and unless he was at once tied up somewhere by himself he would spend his whole time in endeavoring to rub off his rigging against the trees or the other animals. After the pack was put on him it was even worse. When the blind was taken off, the jaquimo stem tied up and he was turned loose, he would walk away for a few swift steps, and then paw the ground vigorously for a few moments, first with his left foot and then with his right. He would then walk rapidly toward the nearest group of animals and charge through the midst of them, knocking them right and left by the impetuosity of his rush and the weight of his heavy pack. If the other mules saw him coming they would usually make way for him very respectfully, but often he came upon them unawares, and then, especially if there were horses in the group, there would be sometimes seen a swiftly moving panorama of teeth gleaming, ears laid back and heels flying. Of course these charges never served to stir his well-packed load, and so, after making as much disturbance as possible among the animals, Rooster would go close to some tree against which he would rub his pack with great energy and persistency, until the train started. From these idiosyncrasies it resulted that the Rooster was greatly admired by all the bipeds of our company, even though he made more trouble than all the rest of the mules put together. He was ambitious and was always anxious to be near the bell, and to accomplish this was continually getting out of the trail and trying to pass the animals ahead of him. If, however, they kept so close to one another that he could not push in between them, he would sometimes give up the attempt, and wandering off to one side, begin to feed. This made little difference when we were traveling in an open country, where he could be easily driven back to his place by the man who brought up the rear, but it often took place in the thick timber, where there was every probability that he might be "hung up" between two trees, and so make trouble, or worse still, on a steep hillside. In fact the latter was his favorite place for an excursion of this kind. He would climb briskly up a steep slope, and when twenty or thirty yards above the trail, stop and browse. Pretty soon, the whole train having passed, Sadlemeyer would come riding along, and seeing the truant would shout, "Hi, Rooster," cracking his quirt in the hope that the mule would come down of his own accord. Rooster would placidly feed on, or perhaps climb up a little higher to reach some tempting tuft of grass above him. Then Sadlemeyer, with a few pungent remarks aimed at mules in general, but especially at this particular one, would lash old Prickly and start him up the hill at a lope a little to one side, in order to head the Rooster back to the trail. But Rooster could climb as fast as Prickly, and usually instead of turning down, as he should do, would keep on straight up the hill until he got tired, when he would stop, let Sadlemeyer get beyond him, and then walk swiftly down the slope and hurry along the trail until he overtook the train.

Belle was a pretty little brown mule, one of whose eyes had been knocked out. She was gentle and willing, and was regarded with much affection by everybody, and her load was always made as light and easy as possible. Stewart used often to say encouragingly as he led her up to be packed, and slipped the *tapojos* over her eyes, "Come up, Belle; the good mules have the good loads."

About Scissors the most interesting point was his supposed great age. He took his name from a brand on his hip which resembled a partly-opened pair of scissors. It was reported in camp that Scissors had come into the country before any of its present white inhabitants, and Stewart even went so far as to aver that the animal had formed a part of Lewis and Clark's outfit, which crossed the mountains in 1804, and in proof of his statement called attention to the hip brand, which looked quite as much like a pair of crossed dragoon sabres, which he stated was the brand of this expedition, as it did like a pair of scissors. I do not profess to know anything about the matter myself, but can testify that the mule had a very venerable appearence, and was at the same time one of the strongest and best animals in the train.

Where or how Hell came by her profane name I do not know, and I will not hazard a conjecture. She was certainly the least popular of our mules—that is putting it mildly—and her name was not often mentioned without some qualifying adjective. My private belief is that her intentions were good, but her intense nervousness and timidity made her a great nuisance, and she was forever in trouble of one kind or another. She was possessed of a frantic affection for the bell mare, and manifested it by running up to her on all occasions and standing as near to her as she dared. This fondness the bell by no means reciprocated, and she never lost the opportunity to kick and bite the unfortunate Hell, who, driven to despair by this ill usage, would retreat to the side of some other animal, there to be met with a like reception. If there was the least opportunity to get into a mud hole, to fall into a narrow slough or to get tangled up in timber, it was Hell's fate to take advantage of this opportunity, and get into some scrape when it would be necessary to take off the pack and by main strength drag her out of her difficulty. It was impossible not to feel sorry for her, for she was literally without a friend in the camp, and equally impossible not to get angry at her when, through pure carelessness or bad judgment, she did something that necessitated the stopping of the whole train for twenty minutes or half an hour while she was being released and repacked. So much of an introduction to some of the four-footed members of the party may indicate that, as individuals, they were not without their points of interest, and that the daily occupation of catching and saddling was by no means a monotonous task.

On reaching camp at night the packs were taken off and the mules turned loose to graze, the horses being confined to hobbles, so that it was difficult for them to go fast or to wander far. The six aparejos were set up like so many little A-tents, side by side on the ground, with the lash rope of each tied up and placed under it, and the blankets, if the night was pleasant, spread upside down to dry over the tops, or if it was wet or snowy, beneath, where they would be protected from the weather. Then the ordinary business of the camp—putting up tents, chopping wood, bringing water, and so on—was attended to,

In the morning, at or just before daylight, the men would get up, and taking two or three sling ropes, would tie them to four or five conveniently placed trees, about four feet from the ground, so as to form a rope corral or inclosure, leaving a narrow opening through which the stock could enter.

Usually the bell would at once guide the men to where the herd was feeding, but if its sound could not be heard, they would start off in different directions and the tracks made in the snow or on the dewy or frosty grass, would soon point out the direction taken by the animals. When these had been found it was an easy matter to drive them to camp and into the corral, and then, by tying up the opening by which they had gone in, they were secured. One man would now take half a dozen jaquimos, and passing under the rope, would quietly, and without making any sudden movements to alarm them, catch the mules one after another and tie them either to the trees or to the rope which formed the sides of the corral.

Sometimes the mules would decidedly object to being caught, and would crowd away from the man who was within the corral, pressing against the ropes so as to stretch them so much that when the pressure was removed, they would sag down and be only a foot or two above the ground. Then unless they were at once driven back by some one on the outside, the nearest mules would jump over the rope and make a dash for freedom. Usually they would not go far, being loath to leave the bell and the other horses, and so were easily brought back. Occasionally, too, a small mule, standing with his head low down, would get it under the rope, and then by raising his head and scraping out beneath the barrier, he could readily escape. So there was often much hurrying about and a good deal of running backward and forward before all the animals had been secured. The turning loose of the stock was necessary to their well-being, because of the character of the country through which we were traveling. Had we been passing through a level, open prairie, it might have been practicable to picket each animal so that all could have been caught up in the morning at a less expense of time and trouble. An animal on a picket rope, however, does not get nearly so much to eat as one that is roaming unconfined, and, if its work is hard, is likely to loose flesh and to fall away rapidly. In a rough and timbered country, however, where the grass is scanty and grows among rocks and trees it is quite impossible to confine stock in this way, for they at once get

their ropes caught on sticks, brush and trees, and soon are tied up so short that they cannot feed at all. The only way, therefore, if there are many head of stock in the band, is to turn them all loose, hobbling the horses and trusting to the bell to keep them together.

After all had been caught, their hobbles were taken off the horses, and they were led away, tied up and saddled. By this time breakfast was usually ready. After it had been eaten the mules were led out, one by one, and their aparejos put on, and were then tied up again while the packs were being made ready.

The process of packing need not be described here, but the essential point of it all is to so arrange and fasten the load that it shall neither injure the animal which is to carry it, nor come off either through the usual vicissitudes of a day's march nor through any extraordinary efforts of the pack animal. A pack that is well put on is much less likely to hurt a mule's back than one which is badly fastened or loose, and one which hurts the animal is more likely to come off than if it rides easily, since the mule is constantly trying to get rid of it. It is important, therefore, that the side packs shall just balance each other so that the saddle shall not bear more heavily on one side than the other. Stewart and Sadlemeyer were two admirable packers, really masters of their difficult craft, and during the whole trip no pack ever came off nor was a single mule's back made sore. In saddling and packing, a broad blind, brought together behind by a thong, was used. The thong was slipped over the mule's long ears which held it in place, and the blind fell down in front over the eyes, completely shutting out the light. With this over its face no mule would move a step.

As soon as the mule was packed the blind was taken off, the stem of his jaquimo passed over his head, in front of one ear and behind the other, and about his neck and tied, and he was turned loose. After all had been packed, the men mounted and the train started off in single file. Usually Mr. Hague rode in the lead, I followed, and behind me came Stewart, just in front of the cook, who led the bell mare. Then came the mules strung out one after another, and Sadlemeyer, on old Prickly Pear, brought up the rear.

The Sportsman Tourist.

UNCLE LISHA'S SHOP.

IX.

ONE February night when the crusted snow on the ridges and drifts shone brighter than burnished silver in the slanting rays of the newly risen moon, Lisha's friends arriving in force found the old man studying his almanac by the light of his little candle. His spectacles were brought to bear on the page headed with the gray wood cut of ten men breaking and swingling flax, and in the background a prancing horse hitched to a sleigh that he never could break, was being swingled by his driver with a club of a whip. Lisha's forefinger went down the columns of the days of the weeks and month as slowly as ran the cautious weather prophecy:

	Now expect
	cold weather
	and good
	sleighing for
	some
(Sexeg. Sunday)	time.
(© low in South).	
	Cloudy
	cold weather and
	likely
	for snow,
	rain
	and
	hail.
	High winds
	and
(G. Washington b. 1732).	
	cold.
	Snow.

till it stopped at "26, Sat.," and underscored the date with a deep nailmark. "Good airth an' seas!" he shouted. "Boys, did ye know 't this was the twenty-sixt' of Febewary? This is the day 't the ole bear comes aout! He's seen his shadder, 'n' he won't poke his nose int' the daylight agin for forty days. We sh'll hev' a col' March, 'n' like 'nough the wind 'll be north when the sun crosses the line, 'n' then we'll hev' a back'ard spring 'n' a poor corn year."

"Bah gosh! Onc' Lasha, ef dat de way you goin' mek wedder, Ah ant want it you mek 'im for me more as a week!"

"Arghem!" Solon Briggs began, clearing his throat and sticking his thumbs in the arm-holes of his vest, "I hev my daoubts consarnin' the paower of human mortality to foretell the comin' futur' weather, which it bein' the case, it haint no way phillysophycable that beasts an' annymills, which human man is sot above 'em, has that segashiousness gin 'em. Haow is wild geese a goin' to know more 'n we do when winter 's a comin', or mushrats to perpare their inhabitations—when they build haousen—for a more 'n oncommonly tough winter, or bears an' woo'chucks know whether the spring 'll be back'ard or for'ad? Haowever notwithstandin', I du not deny there bein' signs gi'n whereby an' by which we can tell suthin' more or less haow the weather 's a goin' to be, sech f'r instance as hawg's melt an' the hus's o' corn, the haighth o' weeds an' et cetery."

"Wal, Solon," said Sam, "your idees an' mine don't jibe egzackly. You 'low 't a man can tell if it's goin' to be a hard or open winter by lookin' 't a hawg's melt 'n' corn hus's an' so on—but annymills can't tell by nothin'. Naow, I don't b'lieve there's any tellin' by a hawg's melt nor corn hus's, for you'll find dif'fent shaped melts in dif'fent hawgs killed the same day—an' what awdds does 't make to an ear o' corn whether the hus's is thick or thin 's long 's they'll be loosened off 'fore winter anyway? An' the weeds grows tall 'cause it's a growin' season, not 'cause the snow 's goin' to be deep. But 'sposen a man can tell by signs 't he sees. Why can't annymills, 'at can see things, an' hear things, an' smell things 't we can't begin tew? A turkey 'll see a hen hawk 'fore it begins to be a speck in the sky to you an' me, an' by seein' or smellin' a crow 'll find carri'n milds off; a fox 'll smell a maouse, or hear him squeak or rustle the grass furder 'n we c'ld see one on the snow, an' he can smell the tech o' yer finger on a bait for a week arter. Swallers know when it's goin' to rain or blow. Mebby they can smell weather. I d'know. An' dumb crecturs has got senses 't we ha'n't got, besides hevin' aourn a good deal sharper 'n we hev. Haow does a haoun' dog strike a bee line for hum when he's done a huntin', or a cat 'at's ben kerried in a bag thre mild find her way back, or birds find their way thaousan's o' miles back an' tew year arter year, or foxes know runways 't they never seen? For my part, I'd a good deal druther trust to dumb creeturs forctellin' the weather 'n seasons 'n I would to what I c'ld find aout by studyin' melts an' hus's. I'd druther take a wild goose's or a mushrat's actions 'an I would even your word for 't, Solon."

"You can b'lieve what y'r min' tew, Sammywell, but I b'lieve 'at there is sartin signs gi'n for aour guidancin', which, f'r instance, I wouldn't kill my hawgs or my beef-crutter in the old o' the moon onless I wanted the meat to shrink in the cookin', ner sow my peas in the waning' o' that lunimary 'f I wanted 'em to grow luxuberant."

"Wal, wal, boys," said Lisha, who had hung the almanac on its nail by the window and got some work in hand, "nev' mind 'baout the signs, an' 'never mind the weather when the wind don't blow.' I'm achin' to hear what luck ye hed arter 'coons that day. I hearn 't ye most all went."

"Ast Joe," some one said, and Lisha asked, glaring at Joe between his shaggy eyebrows and the top of his spectacles, "Haow is 't, Jozeff? Be you cock o' the walk this time?"

"Wal, I d' know but what I be, 'f ye caount walkin' an' choppin'. I da' say I done 's much o' that 's any on 'em. I 'spose 'f I don't give a full 'caount on 't, some on 'em 'll give a fuller one. Wal, I went, an' Peltier he went along with me, 'n' he didn't kerry no axe; said 't he'd got a lame shoulder 'n' couldn't chop 'thaout mos' killin' on 'im. It got well to rights, though, for I seen 'im choppin' cord wood nex' day. We started aout 'baout eight 'clock er half-past—mebby 't wa'n't more 'n eight—I d' know, quarter arter, mebby, 'n' struck a track where three 'coons d.ben 'long daown in the beav' medder swamp in the night. The tracks went a saunderin' 'raound hither an' yon, 'n' fin'ly went off up on 't hill east, 'n' then north—no 't wa'n't, 't was saouth—'n' then east agin 'n' then north 'n' then east, an' s' I to Peltier, s' I, they've went int' the laidges 'n' 't a' no use in us follerin' on 'em; but Peltier, s' he, le's us foller 'n' see where they hev gone. Like 'nough we c'n trap 'm aout, s' he. So we follered an' follered, snow knee deep, till bimeby, arter they'd went all raound Robin Hood's barn, they went towwards the beav' medder agin, an' into 't, an' stopped t' the all-tummuttablest gret big elum in the hull swamp—the tracks did. We sarched all 'raound, 'n' couldn't find 't they'd went any furder, 'n' so I off wi' my cut an' begin to chop. An' I chopped an' chopped, 'n' Peltier he stood 'raound encouragin' on me 'n' chawin' gum, an' gruntin'—every time I swatled the ole axe int' the tree, he'd grunt—I tell ye, he grunted like a good feller, 'nough to chop a cord 'n' a half o' wood. That ere ole elum was jes' 's solid as ole pork clean to the middle, 'n' 'twas all o' three foot through, I d' know but three foot 'n' a half—mebby 't wa'n't but three foot through—any way, 't was tougher 'n' a biled aowl, 'n' the' wa'n't no holler in the butt, 'n' I tol' Peltier, I did, 'at I'd bate a cookey the' wa'n't a dum 'coon in the pleggid ole clum. Wal, I chopped an' chopped, till I sweat like a man a mowin', an' I tell ye I was glad when I see the ole tree begin to tottle an' then come daown kersmash! An' I'll be dummed if it didn't lodge in another elum half as big! An' I hed to chop that daown tew, Peltier helpin' on me, chawin' gum an' gruntin'. Wal sir, when we got it cud daown, 'baout noon, I guess 't was—mebby arter—mebby not more'n ha' past 'leven—the' was a hole most 't the top big 'nough to hold a dozen 'coons, an' the' wa'n't a dummed a one in it! I' hed froze jest a leetle towwards mornin', 'n' they'd come aout an' gone off on the crust. But we hed us a heap o' fun, didn't we, Peltier?"

"Houh!" Pelatiah snorted, "I do' know but what you did."

"Wal, Samwell," said Lisha, "It's your turn naow."

"O, I didn't dew nuthin muh. Follered tew int' an old basswood stubb 't I could mos' push over, an' got them an' one 't was in there afore."

"Julluk your luck, Samwell," said Lisha.

"I faound a cur'us kind of a thing in the stub, sort of a 'coon plaything, I reckon it is. I brung it along to show ye," said Sam, taking out of his pocket a knot or gnarl about the size of a man's fist, and worn quite smooth with much handling (or footing) by the raccoons.

"Wal," said Lisha, after this had been passed around and examined by all, Pelatiah chipping a side of it with his knife and smelling it, "Wal, wha' 'd you dew, Solon?"

"I did not precipitate in the sports and aversions of the day."

"Onc' Lasha, what for you ant ask it me?" cried Antoine, "Bah gosh! 'f Ah 'll git all a 'coon what Ah 'll see dat tam, Ah 'll tole so big story you mos' can' b'lieve him, sah."

"Wal, Ann Twine, 'sposen you tell us what ye seen. I ha' no daoubt that 'll be all 't we c'n swaller to onct."

"Wal, sah, Ah 'm 's go'n' tole you de trute, jes sem always Ah do. Ah 'll go 'lone, 'cause all what Ah git Ah want 'im masef, jes lak Sam, ant it, Sam? Ef t'ant for dat Ah 'll have it somebody for what you call im—m—wisnit? Fus ting Ah say, Ah 'll want you rembler Ah don't goin' tole you where Ah see what Ah 'll see 'cause Ah 'm 's goin' git 'im some tam, me.

"Wal, sah, Ah go fin' track one chat sauvage, folla him leetly way Ah fin' nudder come wid it, bamby nudder, den nudder, den nudder. Ah see so much track Ah mos' can' co'nt it—ten, fifteen, twentee, prob'ly more as tree four tree full Ah guess so. Wal, Ah folla, folla, folla ver' long way. Bamby Ah hear it nowse, mos' lak big hammer ov' dar in de forge, ony he ant go so fas'—*Boom! Boom!*—so, 'baout fas' you breeze you bress. More furder Ah go, more was be dat nowse louder, an Ah begin mos' be 'fraid, me, but Ah don' care, Ah'll folla dem track till Ah come close to big laidge, an' dat track all go in leetly hole jes' mos' too small 'nough for one 'coon sauvage. Den Ah see what mek it dat nowse. *Yes*, sah, you b'lieve it me, de whole top dat laidge, big, big rock, more bigger dis shawp, he lif up 'baout two ninches *ver-y* slow—so—den come daown *boom!* den lif' up, den come *boom!* Bamby Ah'll hear it more leetly nowse when rock lif' up—*Squon-n-n-h!* lak Onc' Lasha mek it when he be sleep, ony not so louder. Bamby putty soon Ah begin be not so 'fraid, an' den Ah'll peeck in hole. Evry tam rock lif' up lit shine in so Ah can see; an' what you tink Ah see? More as tree—honded—tausen chat r-r-raccoon—all fas' sleep! Yes, sah! Evry tam he pull his bref he swell up full of breeze an lif' up rock. Wen he let 'im go his bref, den rock come daown—*boom!* Ah'll see it; he so far in off Ah can' git it. No, *sah*, Ah ant gat not one of it! Das *too* bad. Oh *too* bad, too bad!"

"Wal, I swan to man!" said Solon, exhaling a long breath. "I dew declar, Antwine, you're wus 'n Annynias an' Sophier for onvoracity."

"I move," said Lisha, pitching away his hammer and tumbling his lapstone on to the floor, "I move 'at this 'ere meetin' dew a-journ afore it gits so mad 'at it up an' kills 'at 'ere dummed 'tarnal lyin' Canuck! An' I seeont the motion an' it's kerried unamous."

"Dew you ra-ly 'spose," the questioner whispered in Joseph Hill's ear as they went out into the moonlight, "'at Antwine *was* a lyin'?"

A HAIL FROM THE GREAT ANTILLES.

Editor Forest and Stream:

The three-masted schooner Etta M. Barton, Joel Barton, master, will, I am informed by our Consul, leave this pleasant harbor to-morrow, fully laden with coffee, hides, honey, cocoa, logwood, and other products of this island, to be delivered in good order and condition in Boston on or about the fifth of next month, providing that, favored by the early morning land breeze, she safely threads her way through the narrow channels between coral reefs which now inclose her, and escapes equally unscathed the inhospitable reception by northeasters with fogs, and northwesters with snow, with which Cape Cod and Cape Ann welcome in midwinter the return of their natives—to say nothing of the intermediate perils so beautifully poetized—

> "If [Bermuda] lets you pass,
> Then look out for Hatterass."

She's a taunt and seaworthy-looking craft, and I will take chances on her safe arrival by committing to her my mail, most of it gotten up with such difficulty in the way of chirography in a rough sea way, that writing now without having to hold on to self, ink, paper and desk is a luxury. It's well I am using a pad, though, instead of loose sheets, for although, thanks to the coral circlet which prevents the seas rolling in and joggling, the fresh sea breeze adds to the strength of the trades, and, with my doors and windows open (for, untempered by the wind, 80° is rather a sharp contrast to the 30° I left but ten days ago), loose papers go flying and candles go out with most provoking irregular regularity.

Ten days ago we left Norfolk. Nine days ago we took a gale in the Gulf Stream; eight days and that gale had the best of us and brought us to the standstill, technically called "lying to." Then it sobered down with a headwind so fresh and with such a tumbling sea, that for five days life was a burden, not to be even temporarily laid down in sound sleep. But on the seventh morning, land ho! right ahead; and soon after we were in smooth water under the lee of Turks Island and Salt Cay, and a dozen or so smaller islets with reefs innumerable. Through the channels between, in places over two thousand fathoms in depth, we steamed into the Caribbean Sea. It has always been a wonder to me why the coral insect, capable of retaining life and paying attention to business until his structures grow nearly to the surface, should so generally select the deepest pot-holes he can find to start from.

As we have approached the Bahamas our history has freshened up, and several of us, looking at it from different points of view, have proved beyond question that Columbus did discover and land at first—take your choice of the islands, San Salvador, Wattlings, Cat Island and others. One thing I know, my respect for that brave old Genoese is much increased as I go over his track. On this great, comfortable, well-found in every respect steamer, with good charts, instruments of precision, and plenty of men capable of using them, with full knowledge as to the bearing and distance of our destination, and of all of the dangers of reefs and currents that lie before us; while he, in his little dugout, was plodding along, with no chart, no chronometer, no certainty even that he had a destination nearer than Purgatory.

We would have gladly stopped at Turks Island and witnessed the manufacture of salt; still more to have stopped at Salt Cay, in the village of which, composed of perhaps fifty weather-beaten and sunburned buildings, many of great size, devoted doubtless to the storage of salt, and used as homes, stood the most prominent of all, an immense snow white structure surmounted by a flagstaff, on which floated our flag, it was evidently our Consul's; and as we neared and passed it, we all agreed that an evening with him on one of those verandahs with suitable accompaniments would be far preferable to a trip leeward to St. Domingo. Our patriotism responded to the sublime and exceptional fact that the house of the United States Consul, at Salt Cay, at least was the best one in town. I have seen an U. S. Counsulate sold and made servants' quarters for that of the English Consul—this in Yokohoma; and I've dined with an U. S. Consul, a venerable man and relative of the historian Prescott, with his family in what he called his bungalow, but what was generally well-known to be an ex-stable which he had fitted up—this in Colombo, Ceylon—and lots of our Consuls live almost on charity, but that is none of my business.

The trade winds sweep fiercely over these islands, and had I a friend deeply infected with malaria I would advise him to get board for the winter in, if possible, the Consul's establishment. But we couldn't stop; it wasn't in the orders, and hurried on. The next morning found us off Porto Plata, a quite important town in a commercial point of view, but so illy provided with safe harbors that our stay was but a short one. The harbor is but a *cul-de-sac*, guarded by coral reefs, and with an entrance between them of but little over a cable's length, and in depth but three or four. In a bright, clear sunlight, with a fresh trade wind driving the blue waves over these barriers, and transforming them into masses of snow white surf picked out with green, with a good steamer well in hand, and certainty as to position, these coral reefs have a wonderful beauty; but in dark nights and storms they are terrible, and already, though we have been among them three days, twice as many wrecked vessels, that have met their fate since the last summer (for a single hurricane would have swept away every vestige of them), have been passed.

I have feasted on fresh oranges, bananas, and, greatest treat of all, alligator pears, and to-morrow I'll have fresh flying fish to change my *menu*, and perhaps a turtle. There are rumors of birds in the forest waiting to be shot; great flocks of doves of two varieties—one kind no bigger than a sparrow, of quail and wild goats; and on some of the reefs the fisherman can enjoy himself. Some day I hope I'll learn something about some of these things. Until then, *au revoir*. PISECO.

Natural History.

THE PRAIRIE DOG AS A WATER WITCH.

Editor Forest and Stream:

A correspondent at Palestine, Texas, inquires about the drinking habits of the prairie dog. It is very well known that the prairie-dog towns are generally located upon elevated plateaus, sometimes as far as thirty or fifty miles from open water, and it is not possible that they could travel this distance for water and return to their towns in such hordes as exist; nor is there dew or moisture enough in the grass to supply them with fluid. The prairie-dog towns rise and fall like other empires, and when a prairie-dog town is worn out the inhabitants move west, like other people, first sending prospectors ahead to spy out the land and make a location.

In crossing Northern Texas once I overtook a gang of prairie-dog prospectors on the road, and alighting from the coach gave chase for about a mile, when one of the prospectors, who had been tripped up several times with a whiplash, turned up his toes and surrendered. As I knew his teeth were strong enough to nip a finger off, the driver brought my Scotch shawl which I threw over him and wrapped him up like a baby, and the first thing was a copious micturition on my shawl—just like a baby, too. He was quite full of water, and must have laid in a supply for the journey.

Prairie-dog towns are frequently seven or eight miles in extent, and must contain several thousand animals. The country in the vicinity is denuded of grass for eight or ten miles, and the immediate vicinity of the towns is dangerous to ride over on account of the ground being honeycombed, and on account of rattlesnakes which abound there and feed on the puppies. The large owl frequents the vicinity for the same purpose, and they all make a "happy family." The prairie dogs have an excellent police system and set up a great yelping at the mouth of their little towers on the approach of danger. When shot, they generally fall in their holes and are hard to get out. They are of a dun or brown color, but in some towns I have seen a considerable sprinkling of white ones.

They are easily domesticated and make pretty pets, but look out for their teeth. Domesticated prairie dogs drink water like rats, and scarcely burrow at all. They are commonly kept under the floors of houses in Colorado and Kansas, and serve to destroy or keep away vermin. They thrive well in a humid climate. A friend in the south of England had domesticated some prairie dogs from Colorado, and as they were well supplied with water in their cage on the ground, they were not known to burrow at all, but spent most of the time on a platform seeking their native sunshine.

I conclude from observation and information that the prairie dog burrows for water from necessity and possibly to great depths, and that where a dog burrows man can bore. Consequently, that water can be found in the center or vicinity of any prairie-dog town, with the ground already cleared for cultivation and prepared for percolation.

If you catch a prairie dog be sure to put him in a metal cage, as he will soon burrow through a wooden box. They are generally fat and juicy, and make a remarkably good roast or broil. C. D. P.

Nogales, Arizona.

THE ROCKY MOUNTAIN GOAT.

Editor Forest and Stream:

Your paper of Feb. 5, 1885, which has just come to hand, contains a very interesting account, by Mr. J. C. Hughes, regarding the white or Rocky Mountain goat, the *Aplocerus columbianus* (Coues) of naturalists, commenting on an article published in the December number of the *Century Magazine*, under the heading of "Hunting the Rocky Mountain Goat," and written by William A. Baillie-Grohman.

My only object in writing this is to corroborate some of Mr. Hughes's statements, but principally to place on record certain facts regarding the distribution of this animal not heretofore published, which came under my personal observation, and which I should have done long ago. It is not written to criticise Mr. Baillie-Grohman's article, as I am well aware that the habits of certain species of animals may for various reasons differ considerably in different localities, and this may be one of these cases. If I remember rightly, the readers of your paper were favored a year or so ago with some very interesting articles about this very goat, from the able pen of one of your correspondents who signs himself "Yo." Perhaps we could learn something further about the life history of the Rocky Mountain goat from him. To begin, however, Mr. Baillie-Grohman, speaking about the known range of the Rocky Mountain goat, states:

"It is only found in Western Montana, the northernmost portions of Idaho and Oregon, in Washington Territory, and especially in British Columbia. No authentic instance is known to me of its appearing south of 45° north latitude."

Shortly after the termination of our late unpleasantness the writer's regiment was ordered to return to the Pacific coast, where it had been stationed before the war, and the troop to which I belonged was sent to Camp Independence, California.

This post (now abandoned) is situated on Oak Creek, in Owens River Valley, on the eastern slope of the Sierra Nevadas, three miles west of Owens River, in Inyo county, California; latitude 36° 55′ north, longitude 41° 7′ west, at an altitude of 4,958 feet. And right here is where I saw more or less of the Rocky Mountain goats during the winters of 1866, '67 and '68. One of the local names by which this animal was known throughout this region of country was "ibex." At that time Owens River Valley was but sparsely settled, and game of all kinds was plenty. The Sierra Nevada Mountains in this vicinity reach a higher altitude than at any other point of this extensive ragne, and Mount Whitney, some thirty miles south of Independence, is, I believe, considered now the highest peak in the United States. On the western slope the mountains are densely timbered to an altitude of about 10,000 feet, while the eastern slope is more or less barren, and timber is met with only in patches here and there. The mountain sides are also much steeper and rougher. Here, on the bare, rocky crags, the Rocky Mountain goat find a secure and congenial summer home, where it can rear its young almost undisturbed, and where the crack of the hunter's rifle is but seldom heard. The mountain sheep or bighorn (*Ovis montana*, Cuv.) is also found here, as well as on the Inyo or Monache range, on the eastern side of the valley; but this latter is, as far as I know, not frequented by he goats. It is only some 8,000 feet high, while the Sierra Nevada Mountains opposite tower to a height of 14,000 to 15,000 feet.

The snow lies the year around on all the higher points of these mountains, and in winter the goats, which at that time were by no means rare, are unquestionably compelled, by want of food, to visit the lower foothills, and here at an altitude of some 6,000 feet I killed my first goat, where I have several times known others to be killed. I remember one very successful hunt in particular, and a very one-sided one it was, too, in which a friend of mine, one of the best hunters and surest shots I have seen, killed not less than five of these goats in less than that many minutes with a Winchester rifle, before the flock, consisting of some twenty, were able to get out of range. We carried the game out on pack mules next day, and the leader of the herd, which was among the slain, gave us considerable trouble to get him aboard of a mule. If my memory serves me right he weighed over 250 pounds dressed. I think, however, that the average weight is little if any over 125 pounds, as stated by Mr. Hughes.

I distinctly remember one occasion when I saw some fifteen of these goats almost in the valley proper, certainly not over 5,200 feet above sea level. I got quite near to them, had no idea of seeing any, and as usual in such a case, had no gun along.

Only a few years ago the Rocky Mountain goat was quite plenty in Central Idaho, in the mountains on each side of the South Fork of Salmon River, also in the range bordering Snake River, called "The Seven Devils," and particularly so in the Sawtooth range, near Atlanta in Southern Idaho. On the northern end of this range there is a small lake called Goat Lake, where you could almost always find some.

At all the above mentioned places I know the Rocky Mountain goat could be found, and by no means so very rare, and I presume they can be found there yet in limited numbers, but a person must expect to work hard and will not find hunting them a picnic.

They are also said to occur in Colorado and Wyoming, and I have no doubt of it. Mr. J. Mortimer Murphy, in his "Sporting Adventures in the Far West," I see mentions it also as having been found in Southern California. At any rate its southern limit can safely be set down to the 36° north latitude, if not lower. Seeing is believing.

To the eastward it would appear that in the good old days of the early part of this century the Rocky Mountain goat ranged as far as the Missouri River to near the present site of Bismark, Dakota. See history of the expedition under command of Captains Lewis and Clarke, 1804, 5 and 6, by Paul Allen, Esq., and revised by Archibald M. Vickar (Harper Brothers, 1874, pages 116 and 127). On the latter page the account says, "Nov. 5. The Indians are all out on their hunting parties, a camp of Mandans caught within two days one hundred goats a short distance below us," etc., etc. As this account speaks about antelope, deer, mountain sheep as well, it is but reasonable to presume that there is no mistake here. Chas. Bendire, U. S. A.

Fort Custer, Montana, Feb. 11, 1885.

THE BIRDS OF MICHIGAN.

BY DR. MORRIS GIBBS.

(Continued.)

13. *Regulus calendula* (Linn.) Licht. — Ruby-crowned kinglet.

This sprightly interesting species often braves our raw March weather and is occasionally found with us both spring and fall, during the most rigorous snowstorms. As a rule the rubycrown reaches us in early April, and is not common before the middle of the month.

The song of this delicate dainty bird is a sweet warble, and so ecstatic in the clear rippling melody, that one who hears it must pause and listen for its repetition. The ear of the true musician, or lover of birds, is from necessity attracted by the quavering, varied notes as often as repeated by the vivacious singer. The song, as with the notes of most birds, is difficult to describe, but if once heard is ever to be remembered. It begins with a few low, half articulate notes, soft and melodious, and rises to quite a pitch, again dropping to a lisping, subdued warble, in cadence similar to the softer notes of the robin, but not nearly so loud. The song is finely executed, exquisitely modulated, and is essentially an *allegro* bordering on *agitato*. Nothing can surpass the harmony of the song, heard, as it occasionally is, in early spring, when the chilling winds of March are still rushing through the leafless boughs of the cheerless woods, or mournfully sighing in the evergreens in the city.

The rubycrowns remain some time in the State before passing northward to their summer haunts, and a few may spend the season in the State. It is to be doubted if any remain to breed within our boundaries. During the autumnal migrations, the birds do not all leave us until November. While deer hunting in Lake county, we found this kinglet quite common Oct. 12 to 16, and after two extremely cold nights, many were singing cheerily in the woods regardless of a severe storm of sleet and rain. While crouched behind a log or tree, drenched with water from the pine boughs and anxiously waiting for the appearance of game on the runway, the song of the rubycrown was doubly welcome to me in the deep and silent forest.

14. *Regulus satrapa* Licht.—Golden-crowned kinglet.

This species undoubtedly remains in the State throughout the winter, in mild seasons, but the fact has not been conclusively proven as yet. The goldencrown was observed here on Christmas, 1884, although much severe weather occurred in December. In February, 1879, the species was common in this (Kalamazoo) county, and under conditions going to show that the birds migh have remained all winter in a thick tamarack swamp in which they were found.

The subject of this sketch usually appears in the latter part of March, and becomes quite numerous within the next few days, both in cities, where they congregate among the evergreens, and at the edges of wooded tracts.

The song of this species, if it has one, I have never heard. I have observed only a few chirping, complaining notes, somewhat like those of the creeper (*C. familiaris rufa*), and in no way like the notes of the decisive rubycrown.

Mr. A. H. Boies, of Hudson, in his "Birds of Southern Michigan," gives this species as a summer resident. During seventeen years' observations I have not observed it during the nesting season, and rather doubt if it ever breeds south of 45° north latitude in this State, if at all. The species is recorded from the Northern Peninsula, and is well known by collectors generally in the State.

The food of the gnatcatcher, which is the only species of the three last mentioned that I have had ample opportunity of studying in the summer, is composed principally of minute insects of the order *Diptera*, including mosquitoes, gnats and small flies. During June and July the blue-gray lives largely on caterpillars and other larvæ of small insects, and it, like the two kinglets, is highly beneficial to the farmer and general utilitarian.

FAMILY PARIDÆ.

15. *Lophophanes bicolor* (Linn.) Bp.—Tufted titmouse.

This is one of our more southern species, and has, therefore, not been observed in abundance in the State. Jerome Trombley, Esq., of Petersburg, Monroe county, informs me that it was quite common twenty years ago, and thinks they still breed in the county. He observed three specimens during the months of May and June, 1878.

A specimen was secured by J. E. Nichols near Lansing. We may fairly consider 43° its northern limit in our State. Dr. Atkins, of Locke, has observed a few in Ingham county, always in April. He remarks a peculiar whistle uttered by them, plainly heard at forty rods. Mr. A. H. Boies, the ornithologist of Hudson, failed to embrace it in his list of the "Birds of Southern Michigan," published 1875, but recorded it in 1878.

The information concerning the tufted chickadee in Kalamazoo county is meager. Mr. Benjamin F. Syke, a collector of merit to whom I shall often have occasion to refer, has observed the species here, and thinks it will prove more common than is generally supposed. I know nothing concerning the breeding habits of the species.

MOCKING BIRDS POISONING YOUNG.

Editor Forest and Stream:

I have lived in Louisiana and Mississippi the greater part of my life, and have frequently raised young mocking birds.

It is a fact that if the young ones are placed in a cage where the old ones can feed them they will do so for a while, visiting the cage with something to eat every ten or fifteen minutes, and the birds thrive. But after continuing this for a day or two, the old birds, probably recognizing that the young ones are captives suddenly cease to feed them. Two or three hours without food is sufficient to cause them to droop and no amount of care or feeding will restore them. They invariably die. I have often been told that the old ones would poison those I was raising, but I never lost any, because I did not trust the old ones to feed them without watching to find out if they failed. When they did so, I continued to feed them myself, and I am fully convinced that the old ones do not poison their young.

Issaquena.

Livingston, Ala., Feb. 13, 1885.

I have had a personal experience which effectually removed my skepticism. In June I took a nest of young bluebirds and placed it in a cage, gradually moving the cage from tree to tree for many rods until I brought it within our own grounds. The parent birds followed and fed the little things unremittingly and with apparent content for about two weeks, when the young began fluttering their wings and were ready to fly. The old ones then made every effort to induce them to come out by flying to and away from the cage, and calling them for several hours or through the entire day. Finally becoming convinced, as events proved, of the futility of their efforts, they came with berries, which the poor innocents took confidingly from the loved parents, but in a very short time every one of the little beauties was dead. They were in perfect condition and in full plumage, lovely little creatures, when they were so cruelly destroyed.

Amateur.

South Woodstock, Conn.

The Same Bird.—Referring to "A. H. G.'s" communication in your issue of Feb. 5, I call attention to the following circumstance in regard to winter birds returning to the same winter quarters year after year. He states that he thinks the same bird has returned to his house for three successive winters, and gives his reasons for so thinking. I believe it the same bird, and these are my reasons for believing so. In the fall of 1883 there came to my house, as is usually the case every winter, a number of white-throated sparrows, and among the rest was one that had lost a foot by some means. My family first observed it as it was feeding on the bank, and noticed that it seemed to hop upon only one foot, and upon calling my attention to the fact I took some pains to watch and examine it. The foot had been taken off low down, and the stump of the tarsus looked as though it had been shot off or caught in something like a steel trap. The bird stayed around all winter, and went away at last, as we supposed, forever. But last fall (1884), he turned up again with a number of others. Or I believe it to be the same one, as the one this year has lost a foot in the same shape and on the same leg, and the hop and action of bird are the same as the one of last year. Now I have not in my mind the least shadow of a doubt but that this is the same bird, and I think the above conclusions will bear me out in it. I had thought of writing the circumstance to Forest and Stream a number of times, but did not do so for fear some one would take me to task and pick me all in pieces for trying to establish a fact from what might be a mere coincidence; but as the ball is rolling who will give it the next push?—Armonk (Glenville, Conn., Feb. 9).

About Larus Fuscus.—*Editor Forest and Stream:* If your correspondent "A. L. T." will refer to "Birds of the Northwest, Coues, 1874," pages 604 and 625, he will find *Larus fuscus* given as a synonym as follows: The skua—*Buphagus skua* (Brünn) Coues; *Larus fuscus*, Briss., Orn. VI., 1760, *et al.* The herring gull—*Larus argentatus*, Brünn; *Larus fuscus*, Penn., Brit. Zool. II., 1768, *et al.* The writer having been appointed a member of the Committee on Migration of the American Ornithologists' Union and superintendent of the district of Long Island, N. Y., holds himself in readiness at all times to identify birds sent him from Long Island, and to answer any questions regarding them, as far as lies in his power. He also takes this opportunity of stating that observers are very much needed on Long Island. If any resident of the island will furnish observations regarding its birds, blanks for recording them, also circulars giving full information regarding the work will be forwarded on receipt of name and address.—Wm. Dutcher (mail address, 231 West 128th street, New York; express address, 17 Nassau street, New York). [*Larus fuscus* has been employed as a synonym for a number of North American gulls, as *L. occidentalis*, *L. affinis*, *L. argentatus* and *Buphagus skua*, but this has no bearing on "A. L. T.'s" question. *Larus fuscus* is the European little black-back gull, and we cannot recall the fact of its ever having been taken on this continent.]

Winter Birds on the Hudson.—Annandale, Dutchess Co., N. Y., Feb. 19.—The winter here this year has been quite severe. The Hudson River has been closed several weeks and nearly two feet of snow covers the ground. The cold weather has been the means of driving away many birds that generally remain with us more or less through this season of the year. For some time the only birds I have seen have been the following: *Picus pubescens* (downy woodpecker), *Sitta carolinensis* (nuthatch), *Parus atricapillus* (chickadee), *Junco hyemalis* (snowbird), *Cyanocitta cristata* (bluejay), *Corvus frugivorus* (common crow), *Chrysomitris tristis* (yellowbird), and I might add the *Tinnunculus sparverius* (sparrow hawk). These, with the exception of the crow, yellowbird and sparrow hawk, come daily to my window for food.—A. T. Gesner.

Turkeys and Rabbits.—Cortland.—A friend of mine relates the following: Last fall his attention was called to the strange actions of his flock of turkeys concentrated at one place in an adjoining field. Their craning necks and peculiar notes suggested an intruder. My friend arriving himself with a stick, thinking perhaps, the enemy might be a snake, made his way to the field. The turkeys had formed a hollow square about their prisoner, which proved to be nothing more formidable than a gray rabbit, frightened to such a degree it dared not move and was easily captured. The guard then broke ranks to forage the fields for smaller game. It seems strange so timid an animal would allow itself to be made a prisoner in that manner, when in the beginning its freedom might have been gained by a retreat in any direction.—Mig.

A Tame Ruffed Grouse.—New Hamburg, N. Y., Feb. 10.—It has generally been supposed that the ruffed grouse cannot be tamed. Usually the birds, being so wild, refuse food and die of starvation, or dash themselves against the side of the cage on the approach of any person. I have had, however, a ruffed grouse under my observation for the past two years, a hen bird, so tame that it comes when called and eats out of its owner's hand. It is a fair-sized, handsome bird, in full plumage, and has always been healthy. Any one can see this bird by calling on Mr. Leonard Carpenter, on Main street, Poughkeepsie. He is a sportsman and naturalist, who has a fine collection of hawks, owls, crows, raccoons, prairie dogs, squirrels, and four California quail and six Bob Whites, all alive.—W.

Quebec, Feb, 5.—Some members of the *Turdus canadensis* family, familiarly known as the Canadian robin, were heard yesterday singing among what in season are designated by a local poet "the green woods of St. Foye," two miles southwest of this city. Although harbingers of spring they will have to hold a second meeting, as another snow squall has set in from the eastward and the weather is intolerably cold; the mercury being apparently under contract not to rise above zero Fahrenheit.—H. H. Y.

Game Bag and Gun.

EFFECTS OF DEER HOUNDING.

Editor Forest and Stream:

I have been reading your editorials, and the numerous communications from correspondents which have appeared in late issues of your journal, on the subject of hounding deer, and while I am and have been for thirty-five years a deer hounder in practice, and have killed a great many before the dogs, yet I am constrained to say that I indorse every word you have said in opposition to the custom. I shall not undertake to justify myself on any higher ground than that everybody does it in our country. What I purpose in this communication, is not to excuse my own deer hounding for doing what I do not approve of, but to give you facts in regard to my observation and experience in the matter, and the conclusions which I think these facts warrant me in coming to.

I reside in what is known as the Shenandoah Valley. The western boundary of this beautiful valley is a range of mountains known as the North Mountains. Just west of this is another parallel range known as the Shenandoah Mountains, and so on, with range after range, running parallel to each other, until you reach the main Alleghany range. These ranges extend, under different names, all the way from Pennsylvania to Alabama.

The ranges which are covered by my experience are the North and the Shenandoah. In these mountains, just before the war, there were many localities in which deer were very abundant, when a still-hunter, on a good day, could easily kill from one to five deer. The population was sparse and there were thousands of acres of virgin forest, undisturbed save by the stealthy tread of the hunter or the more vigorous bound of the timid deer. The most prolific section in point of game was one about twenty-five miles in a straight line northwest of this city, and commonly known as White Oak Lick. This was a large area of country drained by the waters of the North Fork of the Shenandoah River, one of the loveliest and most fruitful trout streams (when I first knew it) that I ever saw or heard of. In this vast basin of several thousand acres there lived, in 1860, but one family of people. The father, James Todd, I have years ago given you a biography of. He was the greatest hunter I ever knew, or ever read of, besides being a man of many marked peculiarities. Here on this beautiful stream, ten miles from his nearest neighbor, this man lived, and supported his family of seven or eight children almost entirely by his rifle. When I first visited this part of these mountains, it was to fish for trout. It was in the pleasant June days of 1862, during the "late unpleasantness." It was apparent that the deer were abundant then because their tracks could be seen all along the margin of the stream in great profusion, and it was not an infrequent thing to see a deer in the cool pools standing listlessly there, up to his neck in the water, as a protection against the excessive heat and the annoying flies.

Immediately after the war a company or club of gentlemen from Eastern Virginia got a foothold in this region by purchasing several hundred acres of this wild land; and another family moved into it. Every fall these gentlemen, to the number of twenty or thirty, would come, with from forty to sixty foxhounds, and remain from ten days to a fortnight, and during that time kill from twenty-five to forty deer. But the number secured was hardly equal to the number wounded, caught by the dogs and eaten, and those run out into the settlements and caught or killed by the farmers. But this was not all, the deer were broken up in their haunts and driven off, many of them never to return, and so, in eight or ten years of this sort of warfare, from being a country in which deer were abundant, it has become a hard matter for the last year or two, to make a start of one after hours of hard driving.

Old Mr. Todd protested against the invasion of the hounders, and finally lost his life at the hands of the dog men in a quarrel growing out of an accusation made against him by one of them of killing their dogs. Whether guilty or innocent I do not know, but I know that if he had been protected by law against the hounding of deer, he would have been spared much longer as a useful citizen, and the country in which he lived would to-day be full of that noble game.

With these facts fresh in my own knowledge, what is the correct conclusion? The country is the same, the surroundings are just as they were twenty years ago, but the deer are gone, and there is but one cause to assign, viz.: hounding.

In many States a premium is offered for the killing of wolves, because of the destructiveness of these animals to sheep and deer, and yet the hound, which is but the educated wolf, is protected and encouraged to commit slaughter upon the deer. I remember once to have shot a fine buck in front of a noted hound belonging to a friend of mine. The deer had hardly fallen until this dog was upon him. When I went up to the deer, the dog with his hair turned on end assaulted me, and I had to knock him over the head with the butt of my gun before I could approach the game. I never saw such ferocity exhibited by a dog in my life. The wolf in his native element could not have been more so, and my experience has been that a thoroughbred foxhound, when aroused, is one of the most ferocious beasts in the world; they will attack anything, and woe to the deer that is pursued by them. For if the hunter does not kill him on the "stand," the dogs certainly will. I have grown too old to still-hunt, and I do not expect the Legislature of my own State to prohibit hounding by statute, but if my voice could be heard, it would do so, and if there is the slightest chance for it to be done in your State I wish you God speed in the enterprise you have embarked in.

The section I have given the history of is no exception. There were many other points in these ranges of mountains that were full of deer twenty years ago and the same thing has happened there; the deer have been hounded out until one is now a rarity. There are none left for private hunters or dog men, while the range and the forest remains just as they were. Last fall I went to a range further west than the Shenandoah range, with a party of friends. We had about ten dogs and killed about ten deer in three days. In the immediate vicinity of where we hunted were three gentlemen who kept packs of hounds, and I was informed at the close of the season by one of them, that not less than an average of forty deer had been killed before each pack this past fall. This did not include many wounded and destroyed that the hunters never heard of.

Is it any wonder that the hardy mountaineers whose sport and in many cases living depends upon the game around them, should resort to the rifle and to poison, to rid themselves of the hound pest? I do not approve of such methods. I think a determined effort on their part to have the law interpose to protect them is much the better plan; but one can hardly blame these people for taking matters in their own hands as long as the law does not protect them. Many dogs are poisoned and shot in our State and West Virginia by the still-hunters, but the doing of this is attended with much danger, and has brought death to several men who have resorted to it. Still, I believe if it were systematically and persistently done for four or five years, it would effectually break up the habit of hounding, and the deer would soon recover the waste which hounding has occasioned. Keep on in the good work; and if you can't stop hounding by law, at least legalize the shooting or poisoning of the hound by the guides and natives, and I will guarantee that they will stop it. Whack.

Staunton, Va.

BATTERY-SHOOTING.

Editor Forest and Stream:

In your issue of the 12th inst. you call for sinkbox experience. Five or six years ago a friend, with whom I have had many a good day in the stubble, wanted me to join him in a day's shoot on the Susquehanna Flats. Now as to an enthusiastic sportsman. I am of the kind of whom you wrote some time since: "Give me gun and day, and I will make the weather." I well remember saying to my friend on the way down that I felt pretty certain that I could stop an incomer, even if I had never been in a box. I could drop a quail reasonably well, and concluded it would be almost inexcusable to miss so much larger a mark. In fact I got quite confident, too much so, as the sequel will show. My friend gave a quiet assent to all my convictions, and waited.

There were four of us in the party, shooting from a double box. The captain of our craft told us he would put us on canvasback bottom, and as the flight was good we would likely have a good day's shoot. We lay about midway between Furnace Creek and the mouth of North East, and the day was all that could be desired; just enough wind to occasionally put a little spray over us, without giving us too much of a ducking. My friend arranged that I should go in the box with him on the first lay. We crossed the line then at 8 o'clock, not as now at 5, which is entirely too late, particularly in the spring.

I shall never forget the morning, as I have never since seen so glorious an opening day. From the first dawning until near sunrise the heavens seemed aglow; at one period attaining almost a scarlet, gradually fading as the sun neared the horizon. We lay facing the east nearly, giving us a full view of the glorious display. Imagine the conditions; lying prone on the back, the body below the surface of the water, head raised just enough to bring the eyes on a level with the same, the muzzle of the gun just over the edge of the box, barrel clasped with left hand, right hand lying loosely over trigger guard, your box rising and falling with the lightly disturbed waters, your three to four hundred decoys dancing, prancing, and you can almost imagine, making love motions to each other. The faint light in the east makes it just possible to discern the long lines of early risers that have come up off of the bay, or across Spesutia Island, from the Bush or Gunpowder rivers, for a feast that is nectar; and a banqueting hall containing such an abundance as they know not of elsewhere in all their wanderings. Oh! they are right royal feeders, and wild celery is the champagne of the feast. I have frequently heard men say, "it is a wonder they come," with all the pounding and hammering they get from the earliest day till night from batteries, and oh, pestilence! the innumerable bushwhackers, it is a wonder that they return, not only on shooting days, but even on off days. But they do return, they have been to the feast, and they like it. They do return, but they return wiser if not better birds. And this is the head and front of the defense of battery-shooting; without this it would mean extermination, swift and sure, and no lover of the sport would uphold it for a moment.

On such a morning as I have described they came at any rate, and we lay scanning the heavens above and the waters below. Now look in any direction as far as the eye can reach, the whole heavens seems alive with innumerable lines and bunches of ducks, flying to and from every point of the compass. You see none on the water yet, they are taking an airing and surveying the feeding grounds. This lasts but a few minutes, when my companion calls, "Mark front." I forget the flight above and the beautifully painted horizon in an instant.

Looking as directed, I see approaching, with neck extended, head low, wings spread and perfectly motionless, three birds, apparently going to strike us fairly in the face. They are surely ours now, I think; there can be no possible escape. I rise, so do the birds, in fact, I thought afterward they got up before I did. I am sure they got up too soon for me that morning. I held on fairly with each barrel; they did not drop a feather. I then gave attention to my companion. To my surprise he had not risen. I thought, "Well, old boy, you have it on me now, but you won't catch me again." "Those were cans," he said, and that was all he said. I was hardly down when "mark front" came from my neighbor again. This time I am well settled in my determination to show him I know something. On they come just as the others, only a pair of them this time. It is a beautiful dart, but I am getting anxious; they are surely near enough—yes, I am certain of it, and I defy them to get away this time. I can't help it; I must surely have them now; and I had—but it was the same way I had the others.

It was too bad, but I had learned the lesson my friend had set me in his mind last evening. Like many others, I was killing my ducks on the way to the shooting ground. I asked him very humbly if he would please tell me why I missed the last shots, for I was still in doubt as to all the facts. This was his answer: "When you got up the birds were at least a hundred yards off, and never were nearer eighty yards. It is the old story of a beginner at box-shooting, but you shot so well on the train down last evening, I thought you might kill at least one in four. I will tell you when to get up next time."

Well, when the next pair came in I thought he might never give the word. On and on they came, long after I thought them close in. He said as he rose, "You take the right and I will attend to the left." By this time they were fairly over the decoys, flight stopped, feet extended, breast and whole front thrown fairly up, making a mark that does not require an expert to hit. The result was a pair of canvasbacks. I did not need further coaching for that kind of darting. But, although I have shot every fall and spring since, I cannot always judge the distance of quartering birds not darting.

We occupied the box on this first lay a little more than an hour and a half, boating 28 birds, 19 of which were canvasbacks. The day's shoot was near 60, 37 of which were canvasbacks. I have never since killed anywhere near so many "cans" on a single trip, although last fall I shot four days. Three years ago I was with the same party. On a first day's shoot we boated 91 birds, mostly redheads. We killed many more, losing them to poachers, who were out in numbers. Laws passed since then have broken this up pretty thoroughly, and very few ducks are lost. I was on the grounds last fall for the first day's shoot. The day opened as favorably as could be desired, but we got but few ducks. This was not for lack of numbers, as they were there in tens of thousands, but they did not dart to decoys.

My experience from first to last is that they are less and less easily decoyed. The reason is apparent. As between box-shooting and bushwhacking, the latter is doing much the greater amount of harm, owing, perhaps mainly, to excess in numbers. I say let there be less of both, that we may have better results. Either let the number be less or fewer days, say one or two days in a week. D. B.

SMALL-BORE SHOTGUNS.

Editor Forest and Stream:

I noticed an article in a late number of Forest and Stream advocating the use of small-bore shotguns in preference to larger bores, and I am pleased to see that this subject is being discussed, for I, like the writer of the article I refer to, am a strong believer in small-bores.

Until recently I thought there was nothing equal to a heavy 10-gauge gun for duck shooting and have owned two first-class guns of that bore, made by W. W. Greener of Birmingham, England, both of which did excellent work.

Within the last two years, however, my opinion has changed, and I am now a strong advocate of small-bores. The gun I use is a hammerless 20-gauge, thirty-inch barrels, full choke, weight eight pounds. This gun is chambered to take a three-inch metal shell, and is built entirely after my own idea of what a small-bore should be, and although I say it myself, it comes up to my expectations in every way.

My reason for having it built so heavy and chambered especially for a three-inch metal shell is as follows: By using a 16-gauge wadding which fits the shell snug, I can burn more powder than can be burnt in an ordinary 20-bore of lighter weight, and the gun is heavy enough to overcome any extra recoil. I can get both better penetration and pattern in proportion with about half the load required for 10-gauge guns, and I have no headache or sore shoulder after a heavy day's shooting.

The loads I generally use are as follows: 3½ drams powder with ¾ ounce No. 7 Chicago chilled shot, and 2½ drams powder with 1⅛ ounces No. 4 shot. With the former charge in the barrel fired first, ducks can be shot clean at from 45 to 50 yards, and with the latter load it is the shooter's own fault if he does not bring the game to bag at 60 yards, or even a longer distance. Doubtless some believers in large-bores will say that 3½ drams of powder cannot be burnt in a 20-gauge gun without spoiling the pattern. I will grant that this charge of "fine-grain powder" cannot be used without scattering too much at 40 yards, but I overcome the difficulty in this way: I first put in 2½ drams of coarse powder, then 1 dram of best quality fine-grain powder, with one card wad, one pink edge, one thick felt, and one leather wad (punched out of harness leather) between powder and shot, and a thin, stiff card wad over the shot. I use 16-gauge wadding altogether, with the exception of the leather wad immediately under the shot, which is the same gauge as the diameter of the bore of gun at the muzzle. I have found that unless the wad next to the shot fits the muzzle of

gun exactly that it will, by the pressure of the charge when fired, bulge up in the center, thereby scattering the load; but by using a proper size wad, as above mentioned, I obtain an even distribution of the charge, and the 16-gauge wads prevent any escape of gas. As regards penetration nothing better could be desired, and when No. 4 shot is used with the reduced charge of powder, namely 2¾ drams, I have yet to see the 10-gauge that will beat it, even when loaded with 5 drams of powder. When I desire a scattering charge for rabbits or cover shooting of any kind, by reducing the amount of wadding and using fine-grain powder with a smaller load of say No. 8 shot, any desired spread can be obtained.

I feel convinced that if sportsmen will but give the small-bore a fair trial, they will be more than satisfied with the results; and surely it is more creditable to make a good score with a small bore than with a large one, when we take into consideration the fact that a good 10-gauge gun will, if properly loaded, give a killing circle of 40 inches at 40 yards, whereas the 20-gauge, when loaded for penetration and long range, will barely give a killing circle of 28 inches at the same distance.

I can predict disappointment and discomfiture to the large-bore shooter upon his first trial with a 20-bore. The first time I tried it on ducks after shooting for many seasons with nothing smaller than a 12-gauge, I missed nearly every fair shot, occasionally cutting down birds at a greater distance stone dead; my fault was not holding close enough. I have fired many shots at targets to get the correct charge for the 20-bore, and at some future time, should the small-bore fraternity (which at the present time I am afraid are few in number) increase, I shall be pleased to give an account in detail, of trials with small and large shot, showing the pattern and average, at distances from 40 to 60 yards.

EMERSON, Manitoba, Feb. 4, 1885.

MAJOR J. VERITY'S REMARKABLE SHOT

Editor Forest and Stream:

In reading the accounts of remarkable shots which have of late appeared in your columns, I have occasionally been reminded of the skill exhibited on different occasions by my old friend Major Joseph Verity, U.S.H.M., not for the purpose of inspiring in the beholders feelings of wonder and admiration, but quite as a matter of course.

One of the most peculiar sights I ever witnessed occurred during a reconnoissance made by the Major and myself, attended only by our orderlies, the day after we passed the Walla Walla, and were trying to look up some signs of the whereabouts of old Kamaiakan. The shot was good, of course—that was to be expected; but it was the peculiar result of it which rendered the affair at all noticeable.

As I was saying, we were riding quietly along, with our eyes bent on the ground, and had just entered a small cañon, about as wide at the bottom as a wagon-track. The favorite weapon of the Major in those days was the 10-inch flintlock pistol, of which he carried in his holsters a pair by old Kuchenreüter. On a sudden a clatter of hoofs behind caused us to turn in our saddles, and I set in the spurs as I recognized the war paint of the chief we were seeking, his tall form bending over his saddle-bow and his lance-point quivering above his pony's ears. Close behind, and striving to pass him on either side, came his two brothers-in-law, Humgudgeon and Gumfudgeon, evidently bent on mischief; and behind was a miscellaneous assortment of bucks, squaws, dogs, tepees and lodge-poles. They were moving camp, had seen us, and thought to bag us without more ado. But the Major's pistol was in his hand as the lance was poising for the fatal thrust, the priming flashed, and the deadly missile sped forth on its mission of destruction.

The Major always sighted for the bridge of the nose, and the accuracy of his aim was in this instance the salvation of his intended victim, for the point of Kamaiakan's lance chanced at the instant of the explosion to be precisely in front of his nasal organ, and the ball, striking fairly upon the keen edge of the steel, was split, and the two parts, flying onward toward either side, struck the two right and left hand supporters, Humgudgeon and Gumfudgeon, the one in the right eye and the other in the left, and they were "meat" at once. Dumbfounded, Kamaiakan called a halt. The Major's other pistol was in his hand, but he was never bloodthirsty, and did not fire. The object of our reconnoissance was accomplished, and we returned to camp.

Such things were at that time hardly matter of remark, and I should not have called to mind the occurrence, had it not been for some of the shots made by your correspondents which they seem to think remarkable.

I could tell much stranger things than this. So could "Verity." J. P. SQUIBOB.

ELK RAPIDS, Mich., Feb. 10, 1885.

MAINE GAME.

THE Committee on Fish and Game in the Maine Legislature has about finished its work for this term, since it was understood that it would adjourn finally this week. A number of petitions have been presented asking for special privileges under the present stringent fish and game laws of that State, but in almost every case, as on the question of opening September for deer, caribou and moose hunting, the petitioners have been given "leave to withdraw." The privilege of fishing through the ice for trout with one or two set lines during February and March was asked for, but the committee respectfully declined. Some provision for getting more than three deer, two caribou and one moose out of the State, when killed in open season, was demanded, but the committee declined to recommend legislation. The Legislature was also asked to legalize transportation of game over the railroads when accompanied by the owner, but no satisfaction to the market-hunters or the marketmen was obtained. The Legislature was importuned to legalize the sending home of "a few trout," while the owner stayed to catch some more, but the friends of fish and game protection in the Pine Tree State were awake. They answered: "Once legalize the forwarding of a moose or a deer accompanied by the owner, and every returning Boston runner will be the owner of some venison, and it will go straight to Boston markets. Allow a few fish to be sent home, and every marketman in Boston will have a few sent home to his stall. No, no changes here."

But singularly enough this same Legislature has been exceedingly prolific of special laws for the greater protection of fish and game in specified localities. Nearly a dozen special laws of this class have been passed, either closing absolutely for a specified number of years or better protecting by a longer close time certain ponds and streams. The visitor to Maine the coming summer may find his favorite pond or stream closed. Even the taking of pickerel it is proposed to regulate in some ponds. A special law has been passed for the protection of trout and landlocked salmon in Rangeley, Southbog, Bemis, Cupsuptic and Kennebago streams. The Commissioners believe that these streams are the great nurseries of trout in the Androscoggin waters, and that to protect the little fellows there will keep up the future supply of giant trout for which these waters are noted. I will give the readers of FOREST AND STREAM all these special laws as soon as copies of the bills can be obtained.

SPECIAL.

Editor Forest and Stream:

From your issue of Feb. 19, and under the heading "New England Game Interests," I quote the following: "They attempted to prove to the committee the value of the deer in the Maine woods to the guides and hotel keepers, representing that with September an open month each deer would be worth from $75 to $100, whereas now they are of no value. The people of Maine cannot hunt deer in October, November and December, the weather being too cold. One of the gentlemen argued, however, that September might be opened without harm to the deer, since the foliage is then so thick that nobody could ever catch them." Now, to make a long story short and to come right to the point, your correspondent, "Boston," has either been very incorrectly informed as to our argument before that committee, or else he is an intentional and unscrupulous falsifier. There were two of the petitioners present instead of 402, as he gives it, and instead of two that opposed the petition there were three, Mr. Taylor, of Machias, besides the two he named.

CAPT. F. C. BARKER.

RANGELEY LAKES, Maine.

SOUTHERN SHOOTING GROUNDS.

Editor Forest and Stream:

I have recently returned from my annual trip to North Carolina. I found birds only fairly plentiful, by no means as numerous as in former years. The nesting season was not propitious—too much rain in June and July. There are other and more destructive agencies at work, however, than a wet summer. Countless numbers of sportsmen and others from the North are spending the entire winter in the South, and are making quail shooting a duty rather than a pastime. Many of these gentlemen can boast of records of from none to twenty birds daily for the season; and will proudly produce their diaries showing their score.

I am sorry to state that the popular idea heretofore existing among sportsmen, that the negro would never become a successful wing-shot is exploded. I learned of three negroes in the county recently visited by me, who regularly shoot quail on the wing with breechloader and setter dog accompaniments, one of them an unerring shot and a keen sportsman, who would regard an offer to buy his game a deadly affront. While out one day with a friend we were joined by a strapping young fellow, who volunteered to take us to every "gang of pattiges" on the plantation. He informed us that he and another negro had only a short while before bagged twenty-three quail out of twenty-five shots. Doubting his ability to repeat the performance, I offered to lend him my gun, as I should be delighted to see the best record wiped out with my Harrington & Richardson. He declined on the ground that he didn't understand "dem new-fangled guns widout no hammers." CHES-A-PEAKE.

BALTIMORE, Md.

Editor Forest and Stream:

The early part of the past hunting season in Virginia was so dry and hot that dogs could only work at great disadvantage. Quail were hard to find, being in the branches and thick cover. Our first hunts were therefore anything but successful. In November, one cool bright day after two days' rain, the first for two months, Tom and myself taking advantage of the more promising prospect for a successful hunt, found ourselves at the depot with guns, dogs, and baggage, waiting for the 3 P. M. train to take us to where we had heard was a veritable sportsman's paradise. After twelve miles by rail, we drove ten miles back into the country near the headwaters of the Buffalo River. Most of our drive being after dark, though the moon was shining, we could judge but little of the country. After crossing one row of mountains we found ourselves surrounded by them on all sides, the valleys being mostly in stubble. With hearts as light as school boys' on a long-looked for holiday and expectations great as boys ever felt the day before 4th of July, when they had the house full of powder and fireworks, we arrived at our stopping place, cold and hungry. The people we were to stop with were strangers to us, but had sent frequent invitations to us through mutual friends. "Come and hupt, game plenty, only needs some one with good guns and dogs, who knows how to use them, to get dead loads of partridges." We found our host a most hospitable gentleman, *the* man of that country, farmer, miller, and general authority. A real Col. Sellers, only more so. Millions almost ripe enough to pick, but he wasn't quite ready to shake the tree. He showed us the tree and its fruit. I was only prevented (being a Yankee) from getting ahead of him by my sense of honor to one who entertained me so kindly. It was a sore temptation to give one or two shakes, and bring home enough to enable me to give the poor people of Brooklyn an elevated road or two. We also found our host to be the possessor of a new breechloading gun and a pointer, "the best dog ever known." After supper my pointer, a grandson of Sensation, came in for a little notice and was thought to look "something like" our host's dog, who was to show us next day what he could do. When we inquired about game we got rather unfavorable reports, our host studiously avoiding exciting us by anything like exaggeration. Still, we heard of "the covey that usually stays in the garden," and of somebody going out "Wednesday for a little brush and bagging forty-two quail," not much of a day either.

Next morning everything was covered with a heavy frost, the weeds and grass were very wet, so we did not take a very early start; but got into the field about 9 o'clock, our host with his famous pointer, a friend of his with a little native, rough and ready setter bitch, worth all the other dogs in the party, owing to her experience and knowledge of the country; Tom and myself with a dog each. We were not long finding the first covey, which immediately took to a dense pine thicket. Tom had all the shooting at this covey, as we were separated some distance by a stream which was difficult to cross. Our shooting during the day was confined to a narrow strip of bottom land about 800 yards wide, lying on both sides of the river. Two of us with two dogs were on each side. Occasionally one party would get lively shooting in sight of the others who could not cross the river in time to participate. Once each party had separate coveys up at the same time on opposite sides of the stream, and we made it lively for them for a little while. This bottom land was walled in on each side by steep cliffs of rock covered with a thick growth of ivy. After the rise we had to do our shooting in these thickets, and strange as it seems, we bagged most of our birds in the cliffs. During the first part of the day we made many beautiful misses in the open, killing finely in the thick. Until we "caught on" to the fact that from the time the birds were flushed until they lit they were rising to reach the top of the cliff, and we had been undershooting. After realizing this we shot very much better. Our country friends not being as hard workers as ourselves, killed very few birds. With varying luck during the day Tom and I bagged 30 quail and lost 12 dead birds.

We were kept in the house next day by a severe storm. The day following was very windy and cold. Tom and I hunted by ourselves, with only one dog. That night we had sixty-four quail strung and hung up ready to take home the next morning. We were obliged to hunt but one dog owing to a very peculiar accident which occurred to our best dog, a red setter, the first day. Our pointer stood a single bird in the open within twenty-five yards of some scattering pines with branches growing close to the ground. The bird, when flushed, took a very uncertain and erratic flight, made a dart, attempting to fly under one of the pine trees, about a foot above the ground, where he was killed very neatly by Tom, when to our horror, at that instant, we saw the setter make his appearance out of a red gully, where he doubtlessly was pointing when the shot was fired, in direct line of shot, not more than thirty yards from the gun. He did not make the least complaint, and on examination we could not see that he was shot. He hunted most faithfully for three hours afterward, when, to our surprise, he seemed to be tired out. He followed along and hunted, however, to the best of his ability, for an hour more, when we discovered that he was very weak and bleeding terribly. His hind leg was swollen twice its natural size, and had turned black. We found it full of shot from the knee up, on the inside. Several pellets had cut his belly, but fortunately did not penetrate the intestines. We naturally considered him as good as a dead dog, but carried him home and nursed him tenderly and carefully, and reaped our reward by again having him in the field as good as new two weeks from the day he was shot. During all his pain and suffering not even a whine escaped him, and when his wounds were dressed he would quietly lick our hands, the only thanks he could offer, as he was too weak to wag his tail.

On our way home we stopped at the station for dinner, where we were met with the usual interrogation concerning our luck, etc. The local sportsmen wondering at our show of game, notwithstanding the individual who was said to have bagged forty-two alone a few days before, happened to be one of our questioners. They estimated our bag to be from 100 to 150 birds when it was only 64. We thought, therefore, if we were to be seen carrying so many birds, and every one exaggerated the number, we would be the means of sending a crowd of shooters to kill off all that were left; so I immediately expressed home to my wife half of them. When we got back and met our friends, we only told them that we had enjoyed ourselves a little, made some new friends, and spotted some ground for next year's hunting. Since shooters have taken to telling fish stories, I always answer when asked how many birds I killed, "I have not time yet to dress up my lie in good shape, come around tomorrow before sun-up." BEDFORD.

BROOKLYN, N. Y.

Editor Forest and Stream:

On the morning of the 5th instant, accompanied by my sporting companions, Teccel, Mud and Dit, I left my home with a view to visit some friends who live about twenty miles west of Danville, Va., and immediately upon the border of that State and North Carolina. Knowing, from the representations of some gentlemen who reside in that locality, and the testimony of Dit, who was born and raised there, that the country was a beautiful one and generally well stocked with Bob White, we took our guns and enough loaded shells to kill all the game which we expected to find. We reached Danville at 11 o'clock at night, while the heavens were emptying their liquid contents upon the earth, and sought as early as possible the accommodations of the National Hotel, where we found comfortable quarters and the most intelligent clerk whom it has been my fortune to meet. I recorded the names of each member of our party, and this clerk was able to read them off without that stupid hesitation exhibited by most people who are brought in contact with my chirography. After that performance, if any one impeaches his higher education, I have only to say—Q. E. D.

The train of the Danville & New River Railroad leaves Danville at 8 A. M. In consequence of the early hour we could not enjoy the beds so long as we wished, and were roused from our slumbers a few minutes after six. Having left our baggage at the station, we were obliged to depend upon the comb and brush of the hotel in order to complete our toilet, and Mud was exceedingly out of humor because he could not get access to his trunk for his *robe de chambre*, —or in plain English, his night shirt—which he regards as absolutely necessary to lulling him to sweet repose. However, he managed to get a few "cat naps" during the night, and was unusually prompt in making his appearance in the office, preparatory to that artistic brushing of his "ambrosial curls," which always precedes his meals. In the absence of bear's oil, balm of a thousand flowers, or other hair grease, he was forced to use a little water and then betake himself to the common brush and comb, which adorn a corner near the wash basins. He took a broken goblet which was placed near the cooler, and in vain tried to get his supply of the liquid from that source. It was dry. Teccel suggested the cask near one of the bowls. Thinking it was a trick to put him on the wrong track, he refused to resort to it until a stranger informed him it was the right place. This is not an uncommon weakness—for too many persons accept the statements of those who are unknown and reject those of their friends. Being thus assured, he unhesitatingly placed his goblet under the faucet, gave a quick turn of the lever, and was supplied with far more than he wished, for the force of the stream was so great that the water was thrown all over him. This mishap we regretted, of course. He managed to get passably dry before breakfast was announced, and as usual, did full justice to all the eatables in the menu.

While sitting in the coach waiting for the whistle of departure, we noticed several heavy-looking trunks on the carts of porters approaching the baggage car, and on the opposite side of the street two individuals with a couple of setters each. In a short time they waded through the mud.

and came across. Their dogs looked as bedraggled as the cock in the barnyard in Irving's "Wet Sunday at a Country Inn." While the baggage was passing the window where I sat, I saw on a box the name of one of the parties, and calling the attention of my friend Dit to it, he stated that the name was borne by a Philadelphian who had made a visit to the house of his brother Joe, who lives on the border of "the Meadows" for the past several years during the hunting season, and indulged himself in the earnest effort to bag the birds which were generally quite abundant in that neighborhood. Sure enough, when they entered the coach it was seen that they were respectively Mr. J. C. W., of Philadelphia, and Mr. H. G., of Wilmington, Delaware, and that they were going to the same place which we were seeking, and we soon became somewhat acquainted.

After leaving Danville, the route of the railway, for some seven or eight miles, after leaving the track of the Richmond & Danville road, is in North Carolina, and then it gets into Virginia. A branch of it leaves the main stem, just as the road goes back into North Carolina, and at present extends to Leaksville. The other turns to the right, enters Virginia, and is completed to Patrick Court House. We were on the Virginia train, and after passing through a lonely country, especially inviting to those who are fond of wing-shooting, we reached Byrdsville, the place of our destination. It rained all night when we were at Danville, and was still raining when we left the cars at the station, and were conveyed to the house of our friends. Joe and Bud, the hospitable gentleman whom we were to visit, came with the vehicles, and gave us all a cordial welcome, the reception we felt sure we would meet. In about a half hour Teceel and I were seated before a crackling fire in the parlor of Bud, while the others, no doubt, were warming themselves around the capacious ingle in the library room of Joe. So soon as her household duties would permit, Mrs. Bud made her appearance and greeted us with that genuine hospitality which a true womam soon exhibits to the friends of her husband. Our entire stay was brightened by acts of unaffected kindness, on the part of the families of both of these gentlemen. The only fault I had to find with the treatment was that the good woman gave us too much to eat, in both variety and quality of food, which rather severely taxed my digestive powers. All of us, except Teceel, paid the hostesses the highest of all compliments—the free stowage of the victuals which were so generously provided. I shall cherish the few days passed under their hospitable roofs as very green spots in the journey of my life.

The afternoon of the first day was rather unpropitious for field sports, and we deferred the effort until the following day. Bud's gun was broken beyond any power to remedy—for I had my tools and tried it—and Joe's had been patched up so as to make it possible to use it. It failed entirely, however, before we left, and my mechanical genius was successfully applied so that it may perhaps last during the balance of the season, provided he does not stumble into a ditch nor meet with a mishap similar to the one which caused the disaster.

As a sporting region, this country was not in its holiday attire. A prettier one for bird shooting I never saw; but the valley had been so parched by the droughts of the preceding summer that not a drop of water was in any of the small streams, and the birds were forced to go to where it could be found. Besides this it is a favorite place for the sportsmen and others of Danville, and the few birds which remained have,fallen victims to their almost incessant fusilade during the months of November and December. In one of our rambles outside of the most inviting fields, we found quite a number of coveys of fair size, but such was their fear of us that they took refuge in so dense cover that it was folly to pursue them. Dr. E., the owner of the estate where we hunted, was with us and showed us all proper courtesy. He was simply a spectator, for gunning is not his profession. This was the most successful day we had, and we bagged, I think, thirty-four birds. My score was, as I expected, the smallest of the three, for Teceel and Bud are among the most expert shooters I know.

Joe, Dit and Mud went in a different direction and got more birds than we did. Of course they found more and in better places, for I know I can, at least, equal either of them in skillfulness. The gentlemen from the North met with less success than we did. Both of them have high-grade Westley Richards guns—one a 12-bore hammer gun, with that ugly break which that gunmaker sometimes uses (I have one of them), and the other a pretty little hammerless, by the same maker, 16-bore and weighing 6½ pounds. It is choked. I was astonished to see that both of these guns are loose in the joints. Mine, which has been used much more, is as tight as when it came from the shop. Their dogs are of the patrician blood, and have had, as I learn, full education in the highest canine curriculum; but, so far as I saw or was told, they were in no respect superior to our unpretending, common-blooded mongrels, without any pedigree, and who got all their learning in "old field schools."

This reminds me of a story which Mr. G., one of the gentlemen, told, illustrating the very sensible ideas which some men entertain. A believer in fine blood was the owner of a dog of "high degree," whose ancestors were known for many generations and held a prominent place in the "Stud Book." He had a market value, because of his lineage, equal to that of a first-class roadster. On one occasion he hunted with a brother sportsman, whose setter was of peasant stock—

"His gaucie tail, wi' upward curl,
Hung ower his hurdies wi' a swirl,"

like Luath in "The Twa Dogs." It so turned out that the red blood found all the birds, set them stanchly and retrieved them nicely. The blue blood did nothing but exhibit "style" in his movements. When the facts were stated by him to his friends, he admitted that the other dog beat his badly in the field, but he had no blood, and, therefore, was valueless. His dog, to be sure, found no birds, but then he had blood and "style!" Was this fellow a fool? Let the story answer the question.

By some unaccountable association of ideas I am led to relate one of the many peculiarities of our friend Mud, the man who is the hero of the "Gun Swab." On his way to "the Meadows" he found it convenient to get a pair of canvas breeches in Charlotte. Going into a store he made inquiry for the needed article. He was told that the merchant had but one pair on hand which he had purchased for himself, but which were too small, and he could not use them. If they would fit he could take them at cost. "What size are they, Mr. O'Dowell?" inquired Mud. "Thirty-two in the waist and thirty-four in the leg." Mud, though a voracious eater, has apparently but little stowage capacity, and measures at the belt only twenty-seven inches. He replied, "They are too large, I want only twenty-nine. They will not do." He was urged by Teceel to try them on, and they might answer his purposes. To this he consented, and was soon inside of them. The fit was perfect. He told his friend and companion that they were exactly right, "but they will not do, for they are thirty-two and I wear twenty-nine." "Still they fit, don't they?" "Why, yes, but they are thirty-two and I wear twenty-nine. So they will not answer; if they were twenty-nine I would take them." Isn't he a queer one? But he is a good fellow with all his eccentricities, and always manages, through sympathy, I suppose, or flattery, to get on the good side of all the wearers of crinoline whence he goes.

Notwithstanding we had a pleasant time socially, our success in the sporting line was rather a failure. So when Monday afternoon came, after a most excellent late dinner, we bade our kind friends farewell, receiving from then an invitation to come again, when, they hoped, the birds would be more abundant. Teceel, Mud and I took the train for Danville, and reached home the following day, finding our families well and glad to see us. We left Dit on the soil of his birth. He expected to remain several days longer, with his brothers, Jim, Joe and Bud and his daughter, who recently married a most estimable gentleman, an ardent sportsman, who has a beautiful residence on a fine estate, adjoining the possessions of the parties whose special guests we were. To those and others whom I have not named, as well as the visitors from the North, we extend our thanks for the courtesies shown us, and express the hope that we may meet again, and enjoy ourselves abundantly in the house and field. WELLS.

ROCKINGHAM, N. C., Jan. 19, 1885.

Editor Forest and Stream:

Four weeks of the hunting season last autumn were passed in Milford, Va. As yet the place is little known to the sportsman. It is on the R. F. & P. R. R., seventy miles south of Washington, and only twelve hours' ride from New York. One of the best features of the country there for a sportsman is that it is well watered for both man and dog. Only a sportsman who has hunted in a region where this is not the case can understand the full meaning of this. To carry water for the dogs, or to be obliged to leave the shooting and wander about in search of it, as was the case this fall in the majority of the hunting grounds, will try the zest of even the most enthusiastic sportsman. The hotel is right on the hunting grounds, you step from the cars into the hotel door, where you will find Capt. J. W. Gill, the proprietor, and a thorough sportsman. The Captain keeps two fine specimens of the Gordon setter. We went there to shoot and we did shoot. Never was a month more pleasantly passed. We killed about six hundred quail, a good many woodcock, and a few wild turkeys; and yet if I was to say what constituted the chief pleasure of the trip I should not say it was the abundance of birds, but rather the nature of the shooting ground. The country is open and game easily found. As Mr. S., from Baltimore, said, "I would rather shoot twenty birds a day at the Captain's, than fifty birds elsewhere."

STAFFORD.

SOME REMARKABLE SHOTS.

Editor Forest and Stream:

In boyhood in old Maryland, one fine morning when hickory nuts were ripe, Gus and I betook ourselves to the field for a quail hunt. On our way home we ventured into what was known as "Shoemaker's Bottom," noted for being the best squirrel ground in the country. Mr. Shoemaker also prohibited any hunting there. Nevertheless Gus took one side of the woods and I the other. In a few minutes I heard Gus fire four shots as fast as he could load his singlebarrel. I hurried to him and saw a large gray squirrel high up in the end of a hollow limb. Gus said he could not even make him wink, much less kill him. I tried two shots with no better success. A fire in the tree would smoke him out, Gus suggested, and in a minute the tree was smoking, and seemed inclined to burn down, as it was partly dead and dry. It struck me just then that the squirrel might be dead, though in such a position as to look alive; also that Shoemaker would have us brought before the Squire for burning his tree. There was no time to think more—we dashed to a spring close by—I off with my boots—Gus took one, I the other—and after a half hour's work packing water in my boots we extinguished the flame. Then I ascended the tree, to find the squirrel dead, killed by the first shot. H. A. S.

BUTTE CITY, Montana.

Editor Forest and Stream:

One day last fall while hunting ducks among a group of small lakes where there was little or no cover, I rested my gun on a fence and fired, killing three and wounding a fourth. On measuring the distance found it to be 102 yards to the shore, and the ducks were about three yards out in the water. I used at the time a 12-gauge gun, 8 pounds weight, 30-inch barrels, loaded with 1⅛ ounces No. 4 shot and 3½ drams powder. During the winter while hunting jack rabbits, I fired at a jack sitting in the mouth of his hole, and on going up found two dead rabbits instead of one. They had been lying side by side. I used a Sharps military rifle at the time.

DENVER, Col.

Editor Forest and Stream:

In looking over my diary I find one remarkable shot to my lot. While looking up into a large tree, I saw a crow alight in the top. I pulled on him and three crows came tumbling down. I thought the top of the tree was coming. The friend at whose house I was staying said it was the best shot I ever made, as the crows had been stealing his young chickens all summer. R. F.

PHILADELPHIA, Pa.

Editor Forest and Stream:

A remarkable shot—remarkably disgusting to the shooter—was that fired by my friend Eustis in the gray of an early morning. He turned out of camp before any of the rest of us, sneaked off alone and discharged a fusilade at what he thought was a duck on the shore, but which proved to be only an oval-shaped stone I had placed there for anchoring a captive turtle. SCATTER-GUN.

IOWA.

Editor Forest and Stream:

No person who has been in the habit of using a gun can read your column of remarkable shots without being reminded of similar occurrences in which he was either a principal or witness. That pulling a trigger is sometimes attended with such surprising and not unpleasant results, adds materially to the sport of hunting. There are, of course, surprises that are not quite so agreeable, but they seem to be decidedly in the minority.

Once in my earliest hunting days, when I was first permitted to go alone to the woods, armed with a real gun, a venerable single barreled muzzleloader, I espied a black squirrel seated on an ant hill devouring an ear of corn. I crept up to within fifteen yards of the squirrel, and resting my gun on a rail of the fence, took as deliberate aim as my somewhat excited nerves would allow, and fired. When the smoke had cleared I was considerably surprised that neither hide nor hair of that squirrel was to be seen. A glance at the nearest tree was just in time to reveal a black tail being withdrawn from view. I reloaded and soon discovered the owner of the tail, but he was very active and ran from treetop to treetop, giving me a long, exciting chase, till finally he escaped. On my way home in the afternoon, I thought I would review the scene of the action and ascertain if possible where the charge of shot went that missed the squirrel. My chagrin was changed to delight, when on going to inspect the ant hill I found behind it the lifeless squirrel.

I once saw a mallard drake in the edge of some reeds on the opposite side of a small pond to me, and as the distance was a long one I was speculating as to the chance of killing him if I were to shoot. He raised himself in the water and flapped his wings, presenting his whole body to view. This decided the queston and I fired, knocking him over. Going round I waded out through the reeds to retrieve him, and in so doing discovered two other mallards that had been killed by the same discharge.

A friend says he felt decidedly cheap when he aimed, as he thought, well ahead of the leader of a flock of four ducks flying in single file, and the fourth one fell to his fire.

Another friend, who does not claim to be a wing-shot, had been endeavoring for some time to kill partridge on the wing, but without success, till one day a bird started so near him that his nerves were completely upset. Without raising his gun he convulsively pulled trigger. Strange to say instead of riddling his companion or the dog he killed the grouse. J. M. E.

Editor Forest and Stream:

Many years ago, when a chunk of a boy, I was returning from the swamps after a rather unsuccessful duck hunt, afoot and alone. I was armed with a little, old, long, slender, light, single-barrel shotgun, a 16-bore, I think. It was heavily charged with, I think, No. 3 or 4 shot. I wished to fire it off before reaching the house. There was a bunch of wild geese sitting near the center of a forty acre field on my right, 200 to 225 yards away. I pointed the gun in their direction with an elevation of perhaps twenty to thirty degrees above them and let go. The geese all flew but one. it could not fly. I dropped the gun, boy like, and started for it. It could nearly fly, but not quite; the ground was freshly plowed, and the goose, with the help of its wings, could run as fast as I could. A race followed that was long and doubtful. When I thought I could run no longer I stopped and shed my boots, then, after another long exhausting tug I captured the goose. I found that I had placed a shot in the last joint of its wing, just under the skin, but not out of sight.

In later years, one day riding up a gentle slope in my buggy I saw a covey of quail in the road ahead of me, they ran into the hedge at the side of the road. Having a .22 Ballard rifle with me I stepped forward to see if I could get a chance to nip one of their heads off. Following carefully along, directly I saw one hop up on the edge of a square stick of timber lying end to me beside the road. Dropping on one knee, which brought my rifle about on a line with the log, I fired from the other knee as a rest, very carefully so as to clip off the quail's head; it was 20 yards away. I did it nicely as I could see by the way it bounced around. No quail flying I slipped in another cartridge to try for another. After some time by careful strategy I got another shot and a bird; I then went back to gather the bird, found it, and then for some reason or other stepped to the log where I had shot, when to my great surprise I found three other quail dead beside it in a row, all shot square through the body. The strange thing about it to me was how these three other quail could jump on the log while I was sighting and I not see them, which they evidently did. Five quail in two shots with a .22 rifle is certainly good pot-luck.

BYRNE.

LACON, Ill.

REYNARD'S WAYS.

OF sleeping foxes, a Swanton, Vt., correspondent writes: "One morning after a heavy fall of snow, myself and friend on a fox hunt, were riding through land grown up to bushes and small timber. Old Reliable, our hound, was following behind the sleigh, when suddenly he was missing. Going back, we found he had left the road evidently in a hurry. The wind was blowing strong from direction he went. We followed his track, but soon met the hound, seeming well satisfied with his short hunt. We found fully eighty rods from where the dog had left the road at the bottom of a narrow ravine about fifteen feet deep, as fine a specimen of red fox as I ever saw, which the dog had evidently caught asleep and killed, as we found where he had been lying on top of a stump a few feet below the edge of ravine. The fox only made one jump from his bed when the hound lit on him. The hound must have scented the fox from the road where we were driving, as there was no fox track in that direction. I see an Allegany county man makes a business of hunting sleeping foxes. Well, all right, if they are too much for him when awake, who can blame him for hunting to catch them asleep. Wonder if this is the way he has to kill all his game. I, however, yet prefer to kill my foxes when they are wide awake."

"Park" reports from Athens, Pa., that Nick Nasboro of that town recently discovered a fox asleep and shot it.

A Middletown, Conn., correspondent, "J. W. T." tells of finding a gray fox in a tree. The animal was killed and its skin presented to Dr. J. W. Alsop, president of the Middlesex Game Association. The gray fox of the South (*Urocyon cinereo-argentatus*) is well known as a tree climber.

A New York correspondent, "A. H. H.," says: "An uncle of mine, living in Vermont, on his way for the cows one day about sunset, discovered a fox asleep on a stone pile. He approached the fox very cautiously, and grabbing him suddenly by the back of the neck, had him secure. It so happened that another gentleman had been running a fox all day. At night, tired and hungry, he returned home with his dogs, but without his fox. Hearing of my uncle's captive, he came up the next morning to demand the fox, claiming that this was the identical fox which his dogs had run and tired out the day before. However, my uncle refused to relinquish his claim, and so the other brought suit to obtain this fox.

"A young man who had just been admitted to the bar (now one of the most prominent lawyers in New York State) and,

spoiling for a case, bought the fox of my uncle. Then the other man brought suit against the lawyer. A long and interesting trial resulted, which lasted over a week, but the lawyer still retained the fox. Whatever became of reynard I do not know, but if my friend the lawyer sees this, possibly he will tell us. Another case: Two young men from my native town were crossing Lake Champlain; they discovered a fox and a dog in close pursuit just coming on to the ice from the further shore and making directly toward them. They saw a fine race for over two miles across the lake. Evidently the fox was very tired and the dog fresh, for the dog overtook the fox about ten rods from the men. Unable to escape the fox turned about and sat down very defiantly facing the dog. The dog stopped and did not dare to attack the fox, neither did the fox dare turn tail and run. So they sat and eyed each other until one of the men crept up and slew the fox with a club."

PHILADELPHIA NOTES.

There is a great deal of floating ice in the Delaware River and duck shooters who are fond of paddling upon the fowl in white skiffs are having good sport below Port Penn. The use of huge guns loaded with at least a quarter of a pound of shot in this sort of shooting savors very much of pot-hunting, and approaches as near as possible to the illegal slaughter which was carried on by the night-shooters with their swivel guns near Havre de Grace a year or two ago. A flock of ducks can be approached with an ice-screened skiff manned by a good paddler, and the greater portion of the bunch killed or crippled by a single discharge from a big-gun. I plead guilty of having once participated in this sort of sport and know whereof I speak, but nothing now could tempt me to repeat my experience. At the present time, the ducks in our bay are in poor condition, the marsh feeding grounds and shoaler places being frozen up, the fowl find it difficult to obtain a proper amount of sustenance. When the marshes are open and food is abundant, which will be the case next month no doubt, good shooting can be had over decoys placed upon the mud and in the pools, the sportsman being hid in a box-blind sunk in the marsh, or from a skiff hauled upon the marsh and well screened with trash or dead reeds. The marshes next month will be taken possession of by the sprigtails and baldpates, and many a point can be selected where good sport can be had, but the ice shooting which is being carried on now, to say the least, is not what a rational sportsman should indulge in. All the ducks I have examined which have come from down the river are as poor as snakes.

Very many prairie chickens and sharp-tailed grouse are being offered for sale in our markets. Advantage being taken of the cold weather, quantities of both species have been shipped to this city in a frozen state. I overheard a game dealer a few days since state that he had just filled an order for twenty dozen quail, and that he could at any moment lay his hands on one hundred dozen. After all, this winter has proven a disastrous one to the game of the Middle States. The earlier portion of the season was an open one, and it was confidently expected it would continue so, but January and February have been intensely cold, and the snows that have fallen have crusted and continued in this condition, so that food for both quail and grouse have been difficult to obtain.

I learn from the interior of our State that wild turkeys, owing to the scarcity of food and the severity of the weather, have been forced from the mountains, and approach the settled sections so close, that many have been killed in the poorest condition, unfit for the table.

I am glad to learn that a number of gentlemen of this city are individually wintering quail, which are to be liberated in the spring. Virginia and Maryland birds having been procured in preference to quail from more southern sections.

HOMO.

Philadelphia, Feb. 23.

MASSACHUSETTS GAME.

The Legislative Committee on Agriculture at Boston, Feb. 17, considered various orders relative to amending the game laws. Dr. Harvey, of Westboro, was the first witness. He wanted the law changed in the interest of the farmers and hunters, so as to prevent the hunting of woodcock in August, since it is not a suitable month for hunting and would also allow the partride to get better growth without being driven off by the woodcock hunters in August. The woodcock do not migrate until October, so that there would be as many to be had if the law is changed. The close season for woodcock and partridge would then coincide. Mr. Wm. Brewster favored the change and thought it best to make all close seasons correspond as nearly as possible. But few woodcock breed here now; not one in fifty to what used to thirty or forty years ago. They have been killed off and driven away. The laws now tend to their increase, but the proposed change would be an improvement. The birds will have to be carefully protected to regain their former numbers. Any legislation tending to protect the breeding grounds of birds would be beneficial. It might be well to have some parts of the State where game could not be killed at any season of the year. There must be much more protection or game will be exterminated. It would be well if the various States had harmonious legislation on this subject. Mr. Brewster is president of the Nuttall Club of Cambridge. The great breeding grounds now of the woodcock and other migratory birds are in Nova Scotia.

President Samuels of the Massachusetts Fish and Game Association said it had prepared a bill which met its views and, he thought, protected the interests of all parties. He called on ex-President Fottler of the association, who submitted the bill, which is substantially the same as that reported by the Committee on Agriculture last year. He said the identical bill reported last year would be fully satisfactory. The proposed bill, however, does not close the present open season for quail, partridge and woodcock. The section relating to the dealers does not make any change from the present law, although the association think some change should be made. No change is made in the section relating to the payment for game brought in from other States. The open season for black duck, wood duck and teal is left as at present, closing April 1. The section of last year's bill prohibited the hunting of wild duck or wild geese on their feeding or roosting grounds in the inland waters. The association does not want to change the present law, but to strengthen it, especially in regard to the partridge. The law in regard to that bird is to apply "whenever" it is taken as well as "wherever." Representative Davis of Tisbury said his district wanted the close season for black duck from March 15 to Oct. 15. Mr. Fottler said the association would be glad to have all the protection possible. The present law does not exempt from protection the shore birds, although pretending to.

After Mr. Fottler had read the proposed bill it was opened for discussion. Mr. J. M. Brown, of Taunton, thought there should be some time in November when deer could be taken. Hon. F. A. Nye, of Falmouth, who has deer on his own farm, urged that they should be protected, even more stringently than at present. He objected to hunting deer with dogs as cruel and inhuman. They are often driven into the water and drowned. The law is not enforced because there is no one to enforce it. There is illegal hunting, but a law prevents the great crowds coming down from New York and Boston. He was satisfied with the law as it is. The deer are not plenty now and should be given more time for increase. Ex-representative Gifford, of Falmouth, urged that these large tracts of wood in Barnstable and Plymouth counties be kept as a deer park. The present close law has been in force since 1883, and the deer are now increasing and have become somewhat plenty. He would have more stringent legislation, and have the Fish Commissioners act as Game Commissioners, and prosecute violations of the law to the bitter end.

Major S. B. Phinney of Barnstable opposed making the law less stringent. Mr. Lowell of Barnstable thought the deer should be protected as a fancy animal. The Cape people and their summer visitors have as much right to have their wishes protected as well as those of the sportsmen. The penalty against trespassing amounts to nothing. Mr. B. C. Cahoon of Falmouth said that to-day the deer are hunted more than during the years when there was an open season. Then they hunted during the open season only; now they hunt right through. If November was an open month it would be better for the deer. The present law is not enforced. He would have November an open month and allow hunting with dogs. He knew no reason why the deer should be preserved, as they are rarely seen unless by hunters. Mr. Shevelin, a Selectman from Sandwich, wanted the open season, if there was one, to include September, so that the people there could hunt as well as strangers. Mr. Abbe of Bourne agreed with Mr. Cahoon. The hearing was adjourned subject to the call of the chair.

MICHIGAN ASSOCIATION.

The Michigan Sportsmen's Association met at the Supreme Court rooms, at Lansing, Mich., on the evening of Feb. 17, 1885. Delegates were present from the Central City Sportsman's Club of Jackson, Lake St. Clair Shooting and Fishing Club, Kent County Sportsman's Club, Kalamazoo County Game and Fish Protection Association, and Battle Creek Sportsman's Club. There were also several individual members present, not representing organized associations. Owing to the fact that the meeting had been twice adjourned, and because of the blockade of the railroads by the severe weather, the attendance was much smaller than was anticipated. Those present were, however, enthusiastic and diligent in business.

The special committee appointed at the December meeting to draft a bill for the appointment of a State game and fish warden, and amendments to the game laws, made their reports, with drafts of bills. These bills were discussed at length and compared with like bills already before the Legislature. A committee of one was appointed to present the bills to the Legislature, with instructions to devote most of his attention to the game warden bill, and if necessary, to abandon all others.

The president's address on the general objects of the association and the necessity for the appointment of a game warden was then read and ordered printed for the purpose of being laid before the Legislature, together with an address to be prepared by the president and secretary. An article on the nomenclature of the Michigan Limicolæ, by Dr. Morris Gibbs, of Kalamazoo, was then read, followed by a paper by Dr. J. C. Parker, of Grand Rapids, on Shooting vs. Fishing. An interesting poem on Bob White by Mrs. H. S. Brown, of Chicago, was then read by the president.

The following officers were elected for the ensuing year:
President, Dr. E. S. Holmes, of Grand Rapids.
Secretary, Mark Norris, of the same place.
Treasurer, N. A. Osgood, of Battle Creek.
Director for three years, T. S. Cobb, of Kalamazoo; Director for four years, E. C. Nichols, of Battle Creek.

Kalamazoo was selected as the place of holding the next annual meeting on the second Tuesday in February, 1886.

The meeting then adjourned *sine die*.

M. Norris, Sec'y.

Loading.—Colebrook, N. H.—I use a 10-bore, of no matter whose make, right barrel cylinder, left choke. The buckshot chamber four in the choke, and the layers are divided in the shell by thin wads; I use 5½ drams of good powder and 12 shot. For duck shooting at long distances, the same powder and one ounce of No. 7 shot inclosed in case, except in front, which remains open and even full of shot, all held in shell by wad, as in ordinary loading. For case I use a No. 1, 14 paper shell, with brass cut away and shell cut to hold one ounce, using the reinforced base only to avoid danger. The appearance of case after you find it 50 yards away from you will be warning enough. I shoot with this last to kill at 75 yards, and with successive shots drew four chickens at 82 yards.—Ned Norton.

Apropos of Camp Tins.—Near the top of each have a small "strap" or flattened loop riveted, have a piece of round steel about three inches long turned up at one end about an inch and flattened so as to fit the loop, the other end cut with a coarse wood thread sharp at the point; this screwed into the end of any suitable stick forms a perfect handle for moving tins about when on the fire, lifting covers when cooking or kettles with hot bales. A simple addition, but having used them for some years wouldn't be without them. The loops need not interfere with the tins nesting and the weight is insignificant.—A. J. H. R.

A Game Score.—A Jackson county, Mo., correspondent reports the following as his score of of game killed during the last three years: Rabbits (common cotton tail), 265; rabbit (mule or jack), 1; squirrel, 53; blackbird, 30; chicken (or grouse), 1; crow, 4; dove, 117; duck, 49; lark, 18; plover, 15; pigeon, 33; quail, 161; robin, 8; snipe, 41; turkey, 1; number of shots fired, 1,021; number of times out, 33. This was without the assistance of a dog. I don't believe there are two dogs in our town that are worth the food they eat.

The Cuvier Club Reception of 1885 was a very pleasant affair. The Cincinnati *Enquirer* gives this history of what has grown to be a very influential society: "A few gentlemen fond of field sports gathered together in 1871 and determined to form a sportsman's society, the object of which was to elevate the tone of field sports and enforce the game laws. Meetings at long intervals were of a desultory nature, but the membership increased. Subsequently the idea of a sportsman's club was abandoned, and it was resolved to enlarge their scope so as to include game preservation. Out of this resolution sprang the Ohio State Society for the Preservation of Game and Fish, for such was the title adopted by the new society. It began its errand weak in numbers and poor in purse. To-day it owns the magnificent club house No. 34 Longworth street, containing one of the most valuable collections of ornithological and ichthyological specimens west of New York. The subject of fish and game preservation is one which is engaging the attention of many of the eminent naturalists and most practical philanthropists of the United States. In Europe it has long since been settled that the fish and game must be preserved for food, and the governments there make the necessary laws and enforce them rigidly. In this country it has been rather customary to regard the fishculturists and game preservers as public enemies instead of public benefactors, and to consider all laws made in their interest as arbitrary oppressions. Game has been ruthlessly and wantonly slaughtered without forbearance in any season; the fish have been taken in incredible quantities, in all periods of gestation and immaturity, until the fields, the forests and the waters have become nearly depopulated. The Cuvier Club has exercised a salutary influence in this regard. It has maintained the principle that the indiscriminate destruction of game and fish is an inexcusable waste of human food, and besides an evil and a crime fraught with many serious consequences. It has molded public opinion to the proper form of belief. In our own vicinity it has enforced the laws, and by persons in authority in several sister States. Again, an attempt to abolish the law by which the present Fish Commissioners of the State of Ohio were created was defeated by the club, and in lieu thereof an act was passed giving them a fund to enable them to carry on their work. Had the Fish Commissioners been abolished it would have been a reproach to the State. The Cuvier Club in the next place, by insisting upon a due regard for the rights of the land-owner, and a just observance of all property rights, has convinced the owners of the soil that the difference between a legitimate sportsman and a pot-hunter is a substantial difference; and far beyond the limit of its own circle it has taught the maxim that to pursue or capture game by any but legitimate means is wholly disgraceful. But the club has not stopped at this. It has united in the movement, not alone to procure needed legislation, but to procure co-operative legislation, securing laws having uniform operation throughout the country within given isothermal lines."

New York.—Obi.—We have more rabbits here to the acre than we can shake a stick at, and can count the snares by the dozen. Grouse are very scarce. One may tramp through the woods for half a day and not see a bird. Quail are all gone the way of the buffalo, we never hear of any in this part of Allegany county.—Obi.

Issaquena.—In an excellent article written by "Steele's Bayou," and published in your paper last year, he mentions Issaquena as meaning "Queen of the Deer." I know that it sounds well, but in the Choctaw language *issa* means deer and *quena* a path or walk.—Issaquena.

Indiana.—Fairland, Feb. 16.—It is snowing hard this morning, mercury standing at zero at 7 o'clock. A good many quail left over, but they are having a hard time of it. Snow not deep, but giving the hawks a good chance to prey on them.—C. W. W.

Sea and River Fishing.

BLACK BASS TALK.

Editor Forest and Stream:

I sympathize with "E. F." in his desire to gain information in regard to fly-fishing for black bass; and, as out of comparisons of experience may come enlightment, I am willing to "chip in" a little for the benefit of the "pot," hoping to get out of it at least as much and as good as I give. I am not an expert angler, theoretically or practically; still, I have dropped a fly, after a fashion, in a good many and widely separated waters, and have had at times pretty fair luck.

As with trout, so I find with bass, that rules and lures which are all right in one place or at one time are not good for much in or at another. Fish, of a given variety, are like people of the same nation. They are all the same, scientifically, and in a general way; but their tastes and habits vary greatly, according to locality and the circumstances by which they are surrounded. At least that is the way it seems to me; and I have come to the conclusion that the only way to find out wherein and to what extent these differences exist is by actual experiment and close observation. I have never found a royal road to success in angling, any more than in other pursuits where tact, industry and patience are requisites.

As with trout, also, so I have found in the long run, and in the greatest number of instances, the scarlet ibis, or a red fly of some sort, the most reliable stand-by for bass, yet at times I have made good catches with other colors, when that particular hue was of no account whatever. The best single afternoon's sport I ever had with bass was one day when I had tried in vain nearly every kind of fly in my book, and half in despair and half in a spirit of bravado, concluded to put on a white and an orange colored hackle, both of pretty good size. With these two flies alone, I took fifty-two bass, varying in weight from half a pound to over three pounds, and at sundown lost a bigger one than any I had landed, owing to the amount of sawing the snell had suffered during the exercises. Still, as I say, I have generally found a fly of red or other gay colors best as a rule, and, so far as my experience goes, they should be considerably larger than those generally used for trout.

Ordinarily, I have found the best bass fishing ground to be over and among rocks, or along the edge of a line of water grass or reeds, near shore, where the "bronze beauties" are pretty sure to lie in wait for minnows or other passing food. A fly well located in these neighborhoods is pretty

certain to get attention, if the fish are in the mood; for, as all anglers know, there are times when no persuasive agency is of any avail whatever. I agree with "E. F." that a lightly cast fly is best; but there are times when a pretty heavy splash doesn't seem to scare them. Then again, I have found it necessary—this when the water is a little muddy or "milky"—to sink the flies a little, by the use of a light split shot at the head of the hook. With this expedient I have sometimes made a good catch when the wary or lazy fellows would not rise to a fly on the surface. I have not found very light tackle or flies of special advantage at any time or place with bass; and, in a general way, I would say to beginners in bass fishing that a good fly-fishing outfit for trout will generally be found a good outfit for bass, with such modifications or variations as experience may suggest or circumstances require, according to locality, season and the disposition, for the time being, of the fish themselves.

Washington, Feb. 12, 1885.

THE TROUT OF BEAR RIVER.

Editor Forest and Stream:

The caption and date of "Millard's" letter in a late Forest and Stream turns my thoughts backward nearly a score of years and prompts me to ask a question. The first Western trout that I ever caught in its native waters, I took from Bear River, Wyoming Territory; at least it was then considered that Bear River, rising in the Uintah Mountains, flowed through the southwestern corner of Wyoming before it again reached Utah, but I find upon consulting a map that it is located entirely in Utah and Idaho, leaving Wyoming out in its windings. Where it does flow I will not attempt to tell, but I know it does not flow across the head of Echo Cañon, as this map seems to make it.

At the time referred to I had been fishing Clark's Fork and was relating my unsuccess to a friend when he suggested that I try Bear River, as "speckled trout" were plenty and grew large in that stream. I was rather more of a "tenderfoot" than he and asked him to go with me. The first fish was a vigorous fighter and afforded all the sport I could desire, but when I laid him on the bank and called my friend I asked: "Do you call that thing a 'speckled trout?" "Yes." "Well, I don't. He, she or it is evidently a trout, but not such as we get in New York State." "No, nor such as we get in Massachusetts, but they are good, as you will find." And I did find them good, on the hook and on the table. And now I would like to know what kind of trout these were, whether *Salmo spilurus* or *S. purpuratus?*

As I try to remember their appearance my memory fails me except as to the black spots which were such a surprise. My thoughts reverted to these fishes recently when President Jordan, of Indiana University, in writing me about Western trout, said he would like to see the *S. purpuratus* (Lake Tahoe trout) get a fair trial in Eastern waters.

I presume some of your readers will be able to tell the kind of trout found in Bear River. In asking whether it is *spilurus* or *purpuratus* that is found in this river, I mean the Rio Grande trout by the former, and by the latter the Rocky Mountain brook trout or Yellowstone trout (*S. virginalis* of Günther and Girard). Jordan's synopsis of N. A. fishes states that the characteristic red blotch on the lower fin of the *S. purpuratus* Pallas, is "very constant," but too many years have elapsed for me to recollect whether the fish I caught had it. I made note at the time, of the, to me, new trout, but my diary was burned soon after. The fact that they were very gamy on the hook, and very excellent on the table, requires no pen and ink memoranda to recall.

Glens Falls, N. Y.

OTSEGO LAKE.

ITS FISH, FISHING AND FISHCULTURE.

THE natural attractions of Cooperstown and the Lake region of which it is the center, are in many respects so like those of the English lakes, that no observant tourist can have failed to note the resemblance.

The general topography of the country is, in fact, nearly the same, save that the mountains about Otsego Lake are somewhat less majestic and imposing.

About two miles northeast of the village, and well up the mountain side, stands Natty Bumppo's Cave. This wild crag, now so famous, is distinctly visible and with a good opera glass may be quite satisfactorily examined from the deck of the steamer Natty Bumppo, as she furrows the placid waters below, or, with screaming whistle, challenges old Natty himself to the echo.

Still further on, from a point nearly midway of the Fernleigh Farm, just northeast of the Fenimore Cooper "Chalet," so-called, and about two hundred and fifty feet from the water, there bursts upon our view a most magnificent panorama of the lake, with all its jutting headlands, the charmingly diversified meadow and woodland of the opposite shore; the blue-tinted range of the Mohawk, and the sweet Susquehanna winding gracefully out of view in the far away southern valley.

Indeed, under the mellow light of a calm June evening, with "Glimmerglass" in perfect repose, its mirror-like bosom absolutely unflecked, save here and there perchance by the salmon's wanton plashes, which, "like scars on the face of a warrior, make it all the more attractive," imagination itself could scarcely conceive a picture of more consummate loveliness. Only he who has stood on the battlements of Stirling Castle, and had his soul ravished with the scene there spread out before him, or from the summit of Redwing has looked down upon sweet Grasmere, dreaming in the vale below, can, even by comparison, form any adequate conception of its beauty.

Still further on we reach the Dugway, a favorite haunt of the salmon trout, where the mountain, four hundred feet in height, sheers precipitately down into ice cold water, nearly two hundred feet in depth. Near this spot the mountain is virtually bisected by what is called the Hog's Back, a most extraordinary freak of nature, not sufficiently familiar to visitors, but which will never be forgotten by those who have taken the pains to climb its lofty ridges.

Indeed, the entire eastern shore is somewhat Alpine in character, and with its terraced ledges, flood-washed gorges, virgin forest and sequestered haunts, must ever afford

> "To him who in the love of nature holds
> Communion with her visible forms,"

inexhaustible sources of delight.

Having thus adverted to some of the points of interest which have made Otsego Lake so irresistibly attractive, we proceed to describe in detail the water itself, with its fish, its fishing, and its fishculture.

Otsego Lake is nine miles long by about one in width, running nearly north and south. The water, averaging about fifty feet, attains in some places a depth of two hundred, and is chiefly supplied from cold bottom springs. Its only constant tributaries are two small streams, whose entire volume is not half that of its outlet, the Susquehanna River. The upper and lower portions of the lake, being shallow and weedy, afford ample pickerel grounds, while the middle portion and whole eastern shore are admirably adapted, by deep water and a soft marl bottom, to the coregoni and salmon trout, and nearer shore, by rocky bottom and sharp ledges, to the rock bass, black bass and yellow perch. After further stating that the food supply is abundant, especially of the "lake shiner," an exquisitely beautiful creature and most dainty morsel, about four inches long, not found elsewhere, it will be readily seen that in no other water of the State could the conditions be more favorable for the artificial propagation of fish. Without irrelevant particulars we append a record of the actual plantings made in Otsego Lake:

1872—Otsego bass (*Coregonus albus*)	74,000
1872—Salmon trout	8,000
1873—Salmon trout	150,000
1874—Salmon trout	65,000
1874—Otsego bass	94,000
1874—Black bass	95
1874—Rock bass	1,000
1875—Salmon trout	100,000
1875—Black bass	105
1876—Salmon trout	76,000
1877—Whitefish (from Caledonia)	200,000
1878—Landlocked salmon	5,000
1878—Salmon trout	100,000
1879—Salmon trout	100,000
1880—Salmon trout	100,000
1880—Smelt (from Hackensack, N. J.)	800
1882—Salmon trout	55,000
1882—California mountain trout	30,000
1884—Salmon trout	100,000
Total	1,359,000

RECAPITULATION.

Salmon trout	854,000
Otsego bass	168,000
Whitefish	300,000
California mountain trout	30,000
Landlocked salmon	5,000
Rock bass	1,000
Black bass	200
Smelt	800
Total	1,359,000

The operations during 1871, 2, 3 and 4 on our own account and at our expense, were conducted in a small domestic hatchery, and in the most economical manner, by Capt. P. P. Cooper. The total outlay, however, was about fifteen hundred dollars.

Subsequently all young fry were obtained from the State hatchery at Caledonia, at the mere cost of transportation, which was about $40 for 100,000 fish. This beneficent policy of the State our people fully appreciate, and it must eventually produce grand results.

On a general review of our work we have to speak first of the salmon trout. So rapidly did this fish increase, that in 1878 they were more numerous than at any time within the preceding thirty years. During the spring of 1880, in one forenoon, with a companion, at a single anchorage, in water 55 feet deep, and near the "Sunken Island," the writer took forty-four fish weighing 86 pounds. Thirteen others were hooked, but escaped, two of them large fish, making 57 strikes in less than five hours. A day or two later twenty-nine were taken weighing 50 pounds. During the same week 300 pounds were taken in a single day.

All this was done still-fishing.

In the following summer, the writer, trolling one morning with a Seth Green gang of O'Shaughnessy 8s, had twenty-seven strikes, losing two gangs, and taking nine fish weighing twenty-seven pounds. About the same time, Seth Green, who first introduced the trolling gang into our lake, took eighteen or twenty fish in a single afternoon. For the last two years, however, these fish have gradually ceased to bite until the catch has become so small as to excite serious apprehension and widespread discussion. Among the various theories some contend with great pertinacity that the trout are all dead, destroyed by some epidemic, which seems impossible, as all dead fish at some stage of decomposition, either before or after sinking, having become surcharged with noxious gases, bloat and float. Now if floating, they would surely be seen in large numbers, and if sunken they would either be dragged up by seines or washed ashore. Neither condition having occurred, this theory must certainly be discarded. Others maintain that the scarcity is wholly due to the illegal use of that most deadly and abominable of all devices, the gill-net, one of which was accidentally hooked up through the ice filled with our choicest fish. Others still insist that the trout are as numerous as ever, but are either gorged with superabundant food, or else, like some handsome flirts who keep their adorers dangling by the gills for months before pronouncing the fatal "yes," have simply taken a capricious whim not to bite until they get ready.

On a careful review of the whole case we come to share the opinion expressed by Judge Potter, of Toledo, and now concurred in by Seth Green, "that all the salmon trout originally planted in Otsego Lake, excepting only such as have either been taken out by fishermen or devoured by other fish, are there now." It is but just to Mr. Green to add that his late theory of an "epidemic" was advocated by him simply in consequence of our own statement and belief that there was little if any gill-netting going on in Otsego Lake. Subsequent events, already adverted to, have, however, forced us both to another and very different conclusion. The prediction is therefore made with confidence that if netting of all kinds can be strictly prohibited, the trolling and still-fishing for salmon trout will ere long be as satisfactory here as it ever was, and as it is now on Lake George, where, only a few years ago, the fishing was if possible worse than in our own. Now, after artificial plantings almost precisely like those which we have made, it is said to be a common occurrence for a single fisherman to take with hook and line in one day fifty or seventy-five pounds of trout, averaging five pounds each.

Of rock bass (the original plant being 1,000) the lake is full. It is regarded as an excellent panfish, and being both a bold biter and a hard puller, affords good sport to the angler of moderate desires.

The result of the smelt experiment remains still undetermined, but as the fish, chiefly gravid females, were delivered here in an exhausted state, and from actual necessity deposited at the foot of the lake, where it was impossible for them to deposit their spawn in the natural way, very slight hope is entertained of its success.

These fish too, it will be remembered, were transferred from salt to fresh water, which possibly may throw some light upon the matter. All expenses were defrayed by Edward Clark, Esq., of Cooperstown, lately deceased. Hon. Samuel Webber, late New Hampshire State Fish Commissioner (to whom, as to other gentlemen who have politely responded to my troublesome inquiries, I desire thus publicly to make my acknowledgments) is of the opinion that the native smelt of Lake Champlain would be certain to thrive in Otsego Lake, and we are not without hope that this interesting experiment may yet be undertaken.

The landlocked salmon deposited in June, 1878, were procured with much difficulty by the joint courtesy of Prof. Spencer F. Baird and Fred Mather, Esq., both of the U. S. Fish Commission, Mr. A. W. Thayer superintending their transportation, and Mr. Edward Clark defraying the entire expense. From this plant, most unfortunately, nothing has ever been heard, save in one or two untrustworthy instances, and the experiment must therefore be regarded, like many similar ones in our own State, as a complete failure, the causes of which remain unexplained. From the black bass plant of two hundred in all, an immense product has been realized, hundreds of this noble fish having been seen at a time disporting themselves about the Sunken Island. Despite, however, the most enticing lures, and the most persevering effort, very few have been captured. The finest and largest are thus far taken in deep water with the shiner gang, when trolling for salmon trout. How shall these wily old patriarchs be seduced from the lake into the frying-pan? A liberal reward and high sport await the man who shall solve the mystery.

Of the 30,000 California mountain trout (deposited in June 1881) 20,000 were placed by Seth Green and the writer at the head of the lake, near the steamboat landing, and the balance in a cold stream running through Mud Lake and discharging into Otsego Lake. Although nearly three years have now elapsed not one of these fish has been taken or seen, and the question whether they will appear at all is growing to be serious. If not, it will prove a bitter disappointment, as the experiment was made under the most favorable auspices, its entire cost being defrayed by James B. Jermain, Esq., of Albany. Lastly, we take up the Lavaret or Otsego bass, falsely so-called, beyond all peradventure the very finest fresh-water fish that swims.

Ranked by many as only a highly honored member of the great *Coregonus* family, with which by recent intermarriage, Seth Green himself presiding at the nuptials, it has now become so irretrievably amalgamated as to prevent any possibility of future scientific distinction, this truly noble fish is, we firmly believe, what that sagacious scientist, Governor De Witt Clinton, long years ago pronounced it to be—a "nondescript, and not the whitefish of the upper lakes."

At a still later day Prof. Louis Agassiz, certainly the very highest authority of his time, after careful analysis, pronounced it to be "in its organic structure, a distinct fish, not found in any other waters of the world." But, apart from these high sanctions, which might well be conclusive, the *Coregonus albus* and the Otsego bass present even to the most superficial observer striking points of difference.

The whitefish has, universally, along the spinal column, a gross fatty secretion, which, in the process of either cleansing or cooking, emits a pungent and somewhat disagreeable odor. The Otsego bass, on the contrary, has always a pure, wholesome smell, precisely like that of a fresh cucumber, and is wholly free from the fatty substance above alluded to. The flesh is also of a much more delicate texture and marked by a peculiar racy flavor, imparted undoubtedly by the tiny "bass fly," so-called, upon which in its prime, during April and May, it chiefly feeds, and of which, by the aid of a microscope, literal thousands may be discovered in a single fish.

As the Otsego bass has rarely been taken except with the seine or gill-net, and as all netting of every description has been lately prohibited for three years by our Board of Supervisors, it become a question of grave moment whether this very delicious fish can be taken freely with hook and line, and we have, therefore, undertaken to investigate it thoroughly. The following opinions of the most intelligent and experienced anglers and fishculturists of the United States, and with which this article will conclude, must, we are confident, be read with lively interest, especially as they all agree, in direct opposition to the popular belief, that the *Coregonus albus* can be certainly and freely taken with hook and line.

Seth Green says: "The Otsego bass (*Coregonus albus*) can be taken with small minnows or red angle worms. I think if your tackle is very fine, and you do not twitch when they bite, they will swallow the bait. Put five or ten hooks (O'Shaugnessy 8s, forged) on fine snell, and loop them five feet apart, with small sinker at the end. Bait some with small minnows (one inch or so in length) and some with worms. Cast out as far as you can from the boat, and let it lie half or three-quarters of an hour on the bottom, feeling now and then to see if you have one on. The best way is to let them hook themselves. The angle worm, if used for bait, should be strung on to the hook with both ends left dangling. When I had the whitefish bites in your lake, I had a salmon trout rig on the same line, and when I felt the bite, made the same hard stroke that I would for the salmon trout and tore the hook out. A light stroke must be made and the fish handled very carefully."

Charles Carpenter, Kelly's Island, Ohio, says: "Many years ago when whitefish were much more abundant than now in the lake, seeing large schools of them, I tried various baits and succeeded in catching a few with cockroaches drawn rapidly through the water. Many more were taken by the hook sticking in their gills or sides outside of the mouth. Some further account of this experiment will be found in the first Ohio Commissioners' Report, pages 33-4."

The lamented Dr. Theodatus Garlick says: "I was once storm-bound at Copper Harbor, Lake Superior, and tried bottom-fishing at night, baiting with small pieces of fresh beef, and caught several large whitefish. A friend of mine, seeing me take these fish on board, soon rigged a line with baited hook, and he caught several also. We were fishing from a steamer, with hand lines, in water about twenty-five feet deep.

"I cut the bait quite small, and handled the fish very carefully, lifting them on board with a landing net. I also caught a few with rod and fly at the Sault Ste. Marie, in the rapidly running water at and about the locks of the canal company there. But I think in deep water the fly would be of no use. I have no doubt you can take the Otsego bass or whitefish in your lake as I took them at Copper Harbor. I would use several kinds of bait, putting on my line several small hooks and letting it lie on the bottom. These fish bite very gently, with no dash, like the trout or other game fish. You will barely feel a slight movement of the line in your fingers. Then with a light strike, you bring them slowly to the surface, and take them out with a landing net. I presume they will take a bait as well in the day time as at night.

I wish I could see the so-called Otsego bass. That fish has always been a mystery to me. Of course, it is not a bass. It is strange how long a name will stick to a fish, no matter how improper it may be. You will never get a hybrid from that fish and the black bass, but you may with the whitefish."

Hon. Emery D. Potter, Toledo, Ohio, late Superintendent of Fisheries in that State, and one of the most successful practical anglers in this country, says: "I have seen a great many whitefish taken at Sault Ste. Marie of Lake Superior with a hook baited with a June or soldier fly. I saw a man take eleven in one hour in that way just before sunset. The fishing was done in a deep, still pool, adjoining the rapids, the bait resting on the bottom, where the whitefish invariably feeds. On opening I have found the stomach crammed full of these flies and their larvæ.

"When taken from their spawning grounds in November there is no organic matter perceptible in their stomachs; nothing but perhaps a teaspoonful of a yellowish gastric liquid. It is very certain that at no time do they consume a very large quantity of food, but what they do eat is of the most nutritious kind, for they are always fat and plump.

"The crustaceans found in greatest abundance in the deep waters of the great Western lakes, are their principal food. The cycops are the most numerous, and I presume they are found in equal numbers in Otsego Lake. They are microscopic entomostracans, and it is estimated that a cubic inch will contain over ten million of them. There has also been found in their stomachs a small shelly mollusk that abounds in deep lake waters. The ordinary shrimp is too large a bait, and in my opinion would prove a failure.

"The soldier fly, the June fly, or a small cockroach would be my bait for all *Coregoni*. If they got anything larger in their mouths it would be an accident. With these I would fish in the deepest waters, with my bait on or within four to six inches of the bottom. A friend told me that he had taken them near Kelly's Island, in Lake Erie, with a small cockroach, but with no other bait. They are gregarious fish, going in herds, like the buffalo on the prairies, inhabiting the deep, cold water in summer and in cold weather approaching the shore, where the water is colder than in the deeper parts of the lake. Do not try to take the Otsego bass with a grub, snail, crab or shrimp, for you will certainly lose your labor.

"The one taken with a shiner in your (Otsego) lake (a splendid specimen weighing seven pounds) must have been afflicted with a terrible disease of the brain or stomach. I would have been afraid to eat him. At the Sault Ste. Marie I have often seen these fish brought in by the half-breeds, who said they took them with a 'soger fly.' It is a very common thing, known to boys, who are said to take a great many in that way in water from twenty to thirty feet deep. It was here, too, that, sitting on the bank near by with a friend, we saw a man haul them in, baiting with a June fly. This June or soldier fly is very soft and delicate, and may be compressed into a small compass, being almost as delicate as when in the larvæ, on which the whitefish feeds. The common house fly might do, but it would be a pity to exterminate him for the sake of a few fish." Elihu Phinney.

Cooperstown, N. Y.

SOME REMARKABLE CATCHES.

By all means let us have some more reports of remarkable catches. Here is a sample cast:

A season or two ago the writer was fishing for trout at the dam across the south branch of the Muskoka River at Baysville, Province of Ontario. I had stationed myself on the apron on the lower side of the dam where the water rushed swiftly over an outcropping ledge of rock, and forming a small whirlpool of some twenty yards in diameter, rushed through the rapids below. I had already taken one or two fine trout, and had suspended these in the water below me by a string, having at one end a steel stringing needle which was stuck perpendicularly into a crevice in the rock. Having occasion to speak to a friend I laid my rod on the timbers of the dam above me with the tip pointing up stream. The rod was, however, scarcely balanced, and the instant my back was turned, the weight of the butt and the reel drew it downward, and it fell into the current only to be instantly swept out of sight and into the pool below. Returning a few minutes later, I could at first find no trace of my tackle, but a careful examination showed that as the rod had been carried swiftly by, the line had caught over the needle which still remained firmly upright in the crevice. Taking the line in my fingers I found that it rendered freely—all too freely indeed—for it came from between the well-oiled pivots of my quadruplex multiplying reel. There were a hundred yards of braided silk, and every inch of it ran from the reel before the rod consented to show itself from the foaming waters at the bottom of the pool. Then drawing in the other end of the line I was not a little surprised to find on one of the flies a handsome pound trout, which had hooked itself in the general disturbance. The rod and reel proved to be entirely uninjured and did gallant service over the pools of that magnificent trout river for the next four days.

The only moral to be deduced is: Never neglect to tie your line securely to your reel or you may be sorry for it. B.

Toledo, O.

Editor Forest and Stream:

Several of us went to Irondequoit Bay for a day's fishing. One of my companions hooked a fish and lost it by the breaking of his line, losing some six feet with a snell hook. We all thought and expressed ourselves that it must have been a whale to have broken that sea grass fishline. Several hours afterward, and at least a quarter of a mile distant in the open bay, I pulled in a half-pound rock bass with the identical piece of line and hook still fastened in his mouth. I was thankful for the fish, and that I should not have to tell father that I had lost part of his fishing tackle.

Strange, is it not, with fishermen, that a fish hooked and lost is always so much larger than when in the landing net.

Irondequoit.

Editor Forest and Stream:

I was fishing in the Black Cañon of the Gunnison. My cast consisted of a No. 12 drab gnat for the top fly, a No. 10 shoemaker next and a No. 8 brown hackle for stretcher. I had been fishing for some time without success, when I at last had a rise, and struck a large fellow on the shoemaker only to lose both lower flies and half of the leader.

Tying on a new leader and duplicating my cast, I hooked another and saved him. Found him hooked in the head with the hackle. The next, missing the shoemaker, was hooked in the tail by the hackle. If you don't think a two-pound trout can pull, hook one by the tail in swift water and report result. My next also tried for the shoemaker and was likewise hooked in the tail by the hackle. Would have lost him but for the net, as the hold broke when close to shore. A third was hooked in the tail and landed. This was getting monotonous and was straining my rod, and I was about to put the shoemaker on the end when a huge fellow made a lunge at it and was also hooked in the tail, but by going into the rapids, and the reel failing to let out line fast enough, he departed with my entire cast, whereupon I reeled in and quit. Thus I caught four trout without hooking one in the mouth. What were their tails doing in the vicinity of where their mouths should be? Who can say? They were all hooked at the first rise. Kokomo.

Salida, Col.

Editor Forest and Stream:

The incident related by a correspondent of having several times caught the same bass, reminds me of an enjoyable day's fishing for black bass in the Oswego River at the head of Battle Island, made memorable by James Fenimore Cooper in "The Pathfinder." My companion and I with rod and line had been capturing large gamy black bass at satisfactory intervals, when through my awkwardness I allowed a bass to run under our boat, which disabled my rod, allowing the fish to escape, and carrying with him a portion of my tackle. We went ashore, had our lunch, repaired damages, and returned to the same spot to renew hostilities. During that afternoon in taking in a large bass I was surprised to find my lost tackle firmly hooked in his mouth. Doctor.

Oswego, N. Y.

Editor Forest and Stream:

Mr. Levison's remarkable catch reminds me of several that I have made or known of. One is as follows: About thirty years ago I was fishing for crappies, or croppies as they spell it now, among the islands of the Mississippi River below Dubuque. I had caught two or three, and had strung them on a string and hung them overboard beside the boat. Noticing a heavy pull on this string, I felt of it and found it gave more resistance than the small fish should, and throwing it suddenly into the boat I landed an eight-pound catfish, which had swallowed one of the fish and so was taken without a hook. Fred Mather.

NEWLIGHT, OR SOUTHERN CROPPIE.

Editor Forest and Stream:

In compliance with the request of "Little Sandy," in Forest and Stream of Jan. 29, I desire to say a few words about the "newlight" (*Pomoxis annularis*) as a game fish. This fish is often confounded with the Northern croppie (*Pomoxis sparoides*), and it may be well to notice a few distinguishing points as between the two species. Both forms may be easily distinguished from all other fresh-water percoid, or spiny-rayed fishes, by having the anal fin as large or larger than the dorsal fin, and the presence of about six spines in each of these fins. (The newlight has six, and the Northern croppie seven, spines in the dorsal fin, normally.) If the angler will keep these facts in mind he will have no difficulty in identifying the genus. As regards the two species, they are very closely allied, though they may be easily distinguished by certain constant differences in form and coloration. These fishes are scarcely mentioned in any work on angling, and then only in a confused and unsatisfactory manner.

The Northern croppie (*Pomoxis sparoides*) is known also in various localities as black croppie, lake croppie, calico bass, strawberry bass, grass bass, silver bass, big fin bass, butter bass, spotted bass, chincapin perch, razor-back, barfish, bitter-head, goggle-eye, etc. Its body is oblong in outline, quite deep—its depth being half its length—and is quite thin, or strongly compressed, especially along the dorsal curve, hence "razor back." The mouth and eye are large, though the head is shorter and mouth smaller than the Southern croppie or "newlight." It has seven spines and fifteen soft rays in the dorsal fin, and six spines and eighteen rays in the anal. The color is bright, silvery and metallic, olive along the back, mottled with green, with many large purplish-black blotches (as if made by the ends of one's fingers, hence "chincapin perch") on the body, in no regular order, but covering nearly the entire surface. The fins are also thickly sprinkled by smaller blotches, and their presence on the anal fin is characteristic of this species. It grows to a foot or more in length, and to three pounds in weight. The Northern croppie, as its name suggests, has a northerly range. It is very abundant in the Great Lake region and Upper Mississippi Valley and the northern portions of Indiana, Illinois, Ohio and Missouri. It exists also in some streams along the Atlantic coast from Pennsylvania to Florida. It agrees in a great measure with the common yellow perch in its geographical distribution.

The Southern croppie (*Pomoxis annularis*) is otherwise known as newlight, Campbellite, tin-mouth, bridge perch, bachelor, sand perch, white croppie, timber croppie, speckled perch, silver perch, spotted perch, goggle-eye, white perch, sac-a-lai, etc. In comparison with the Northern croppie this species has a rather more elongated body, being a little more than twice as long as deep, and is also as much or more compressed. Its head is somewhat longer, and mouth larger and thinner, the membrane or skin about the mouth being semi-transparent, hence "tin-mouth." The snout projects and curves upward, and there is a deep incurve near the eyes, as in the Northern croppie, but the outward curve or arch between the head and dorsal fin is more prominent. In coloration it is more silvery and paler, being olivaceous and light green along the back, and very white and silvery beneath. The markings are much smaller and not so numerous, while the anal fin is scarcely, or not at all, marked, which is a distinguishing characteristic. In some localities this fish is quite pale and seemingly semi-transparent. It has six spines and fifteen soft rays in the dorsal, and six spines and eighteen rays in the anal fin. It grows a little larger and somewhat heavier than its Northern congener. This species takes the place of the Northern croppie in the Lower Mississippi Valley and southern portions of Ohio, Indiana and Illinois. It is quite abundant in Kentucky, Tennessee and the Southwest generally. In central Ohio, Indiana and Illinois both species co-exist.

The croppies of both species are very handsome fishes, and are of similar habits, frequenting deep, still waters, and lurking in schools about weeds, brush, fallen trees, logs, under dams, etc. There are no fish so suitable for small ponds, with deep holes in them, as the croppies, as they multiply amazingly. Though not possessing game qualities in any degree, they are, nevertheless, great favorites with Western and Southern anglers on account of their excellence as panfish, and the readiness with which they bite. Their food consists principally of insects and their larvæ and small minnows.

For bait-fishing the lightest tackle should be employed. As croppies congregate usually in schools and are not very shy, a suitable rod is one of natural cane, ten feet long, and weighing from four to six ounces. The line should not be larger than No. 1 sea grass, or No. 1 twisted silk, and the hook not greater than a No. 4 Sproat tied on very fine gut. As they give little or no play, a reel is not essential. However, where a cast of more than twenty feet is required to reach their haunts, a seven-ounce Henshall rod and a reel may be used, with an "H" braided silk line. Small minnows, especially shiners, are the best bait, which they take very gently, and like the Arabs, "as silently steal away."

This is no percoid fish that rises to the fly so readily and certainly as the "newlight," and herein consists the only real sport in croppie fishing, which is very fair on a light fly-rod of five or six ounces. Trout flies of neutral or subdued tints are the most successful, as the brown, gray and ginger hackles, the various duns, the gnats, the stone fly, gray drake, queen of the waters, cinnamon fly, etc. About sunset and later is the most favorable time for fly-fishing for croppies, though they frequently rise well during the early morning hours, and sometimes, especially if cloudy, at almost every hour of the day.

"Jay," in Forest and Stream of Jan. 15, writes enthusiastically and affectionately of the "newlight," and gives the approved mode of cooking it. He also mentions an opinion that is very current in Central Kentucky, that this fish first made its appearance in that section about the time of the rise of the religious denomination known there as the "Campbellites" and "New-lights:" hence these local names. However this may be for the Elkhorn and other small streams of Central Kentucky, the "newlight" always existed in the larger streams of the State, under several other local names, as "bachelor," "bridge-perch," "tin-mouth," etc., and was first described by Rafinesque in 1820 from specimens taken at the Falls of the Ohio River at Louisville.

James A. Henshall.

Cynthiana, Ky., February, 1885.

VARNISH FOR RODS.

Editor Forest and Stream:

In your issue of Feb. 12, "M." inquires how to make or where to buy a really good varnish for fishing rods. He can buy it of the rod makers. At least, B. F. Nichols, the well-known rod manufacturer of Boston, advertises in his catalogue to send small bottles of varnish by mail. I have tried it and found it good. Probably other rod makers would sell varnish.

It is essential that the varnish be applied in a warm room, and that the rods remain in a warm place for at least two days. W. G.

Springfield, Mass.

Editor Forest and Stream:

I have been employed since 1869 among varnishes and paints of all kinds. Some anglers use English durable body varnish and give their rods a coat every season, others use brown shellac, light hard oil finish and No. 1 preservative, but the best thing to stand the water and rough use of a rod exposed to camp life is spar composition. Any varnish for a rod must dry hard. A varnish made from soft gum don't dry hard and will scratch. Many anglers use too much of such stuff on their rods. A small quantity is better than a lot. No kind of inside varnish such as No. 1 furniture or No. 1 coach should be used, but many do use them because they are cheap. Light hard oil finish will dry hard and although we use it for "inside" work it will stand on rods in good shape, as nearly any good carriage varnish will. If it has too much gloss a little flour pumice stone will help it, or rub it with a little oil and rotten stone, as the less gloss you have the less it will scratch, and a light coat is always better than a heavy one. If any one wants to keep a rod in good shape a light coat of spar composition, light hard oil finish, or any good carriage varnish such as we call body varnish will do; and when you have to give the rod another coat, rub off part of the old one with the fine pumice known as flour pumice and a little water, or use fine sandpaper.

W. A. N.

Springfield, Mass.

Editor Forest and Stream:

If "M." will try what is called spar composition, I think he will find it fills the bill pretty well. I have used it; and although it is rather thick, I have had no trouble from chipping or cracking. I used a rod finished with it all last summer. It gives the rod a finish like glass and water has no effect on it.

Would not the rubber cement that a correspondent mentioned last week be good for fastening ferrules in a rod? I have used gutta percha in solution, whiting and several other things, but never have found anything perfectly satisfactory. O. T. C.

Pawtucket, R. I.

Editor Forest and Stream:

"M." asks me by name to inform him what is the *best* varnish for fly-rods.

This I cannot do, I am inclined to think the Japanese lacker would be better than anything we have for this purpose, though I have had no opportunity to try it.

Still I can suggest *good* varnishes, those which, if properly applied, will so protect a fly-rod that it may be exposed a week to the weather, and be none the worse for neglect.

As far as the angler is concerned varnishes may be divided into two classes—those in which alcohol, and those in which turpentine and linseed oil are the solvents. In the former the alcohol evaporates completely in drying, leaving the body to which it has been applied coated with the gum in almost, if not quite, its natural state. Such durability as the gum has it retains; but nothing is added thereto. Therefore gum has it retains; but nothing is added thereto. Therefore gum has it retains; but nothing is added thereto. Therefore

teased about, the resultant coat will be uneven in thickness' and more or less filled with air bubbles, to the ruin of the job. The varnish should be flowed, rather than scrubbed on. Effort should be made to cover each given part of the surface with a single sweep of the brush, without passing over it a second time. The wood should be free from oil, since then the varnish penetrates into the pores, adheres much more tenaciously, and is far less likely to become mealy or chip off. I consider the varnish above named quite good enough for any wooden rod which is to receive the slightest approximation to decent care.

But the oil-varnishes, those in which linseed oil and turpentine are the solvents, are far tougher and much more durable than any spirit-varnish. Unlike alcohol, these fluids modify the gums combined with them, greatly to the advantage of the compound. African copal is here, as well, the best obtainable gum, and is the basis of the so-called coach-body varnishes if made by a respectable manufacturer. Good coach-body varnish is readily to be had almost anywhere. Since the trouble so often experienced by amateurs in its use is almost invariably due to a faulty method of applying it, a few words on this subject may not be amiss.

The surface to be coated should be free from oil for the reasons before stated. The varnish should be quite warm, say 90° of Fahrenheit; and the wood, brush, and room in which it is to be used, should be as hot as conveniently possible. This makes the varnish to flow better, and the brush-marks coalesce almost immediately and disappear, leaving a perfectly smooth surface so that little rubbing down and fewer coats are required. Besides the warmth makes the varnish much more fluid, and thus a thinner coat may be given. This is one of the secrets of success—as thin a coat as possible. The next step is to coax the varnish to dry. Here the wind is the potent element. A coat of varnish which will remain "tacky" for a week, if kept in a close room, will be perfectly hard in twenty-four hours if exposed to the wind.

This is all there is to it—apply the varnish while warm, in as thin a coat as possible, and expose it to the wind. In a city where the atmosphere is always dust-laden, it will be necessary to allow the varnish to dry indoors until the sticky stage has passed before it is exposed outside. It must not be forgotten that there is a wide difference between dry varnish and hard varnish; and that every coat should be perfectly hard before the next is applied. A rather stiff brush should be used; and though it is better to work rapidly, still the care required in laying spirit-varnish is not necessary. In varnishing wrappings be sure to introduce a little varnish under each ring, or water may penetrate and turn the wrapping white.

Though I use Valentine's "Quick-levelling Varnish," still there are plenty of others just as good. Perhaps practically the best course, all things considered, is to buy at a carriage or car shop some of the varnish they use for the final coats in finishing their work, and at the same time consult their varnisher about its use. Anything which will stand with impunity the exposure to which a car or coach is subject, must answer for a fly-rod. HENRY P. WELLS.

NEW YORK, Feb. 23, 1885.

TROUT FLIES.

Editor Forest and Stream:

The subject of the nomenclature of flies is one that I am glad to see has been brought up. If a genuine standard can be adopted, probably the number of varieties can be reduced one-half or more. There are a great many differences which are so minute that they are absolute nonsense, and which still have "a local habitation and a name." The remedy for this lies in the hands of the National Rod and Reel Association. Let them appoint a committee of experts to weigh and sift, to retain and reject, and embody in their report a scheme for a national standard which will be hailed with gratitude and joy by dealer, maker and angler alike. The readiness with which the standard reel-plate has been adopted shows this. This is part of the work for which the Association was gotten up, and they should put their hands to the plough. PERCYVAL.

BLACK BASS IN WINTER.

Editor Forest and Stream:

I can answer neighbor "C. D. L.," of Swedesboro, that black bass are caught in winter. Dr. Henshall is mistaken in his generalization from his own observations.

About six years ago fifteen small bass were put in the Tumbling Dam Pond within the city limits. Within the past two years about twenty have been taken, all, with the exception of one four-pound fish which I caught last summer with a spinner, by pickerel fishermen through the ice in mid-winter. Ten were taken last week. F. S. J. C.

BRIDGETON, N. J., Feb. 14, 1885.

THE VERMONT FISH LAWS.

Editor Forest and Stream:

I notice in your last issue a letter from your Ferrisburgh, Vt., correspondent, who finds fault with recent amendments made to the Vermont fish laws. I have neither time nor inclination to enter into a newspaper controversy on this subject beyond this, that it would have been far more creditable for that class of fault-finders, as sportsmen and persons interested in fish protection, if instead of standing aloof and now grumbling "Why didn't you do so and so," they had come forward during the last session of the Vermont Legislature and assisted in amending those laws. Had they done so the laws would undoubtedly have been made more perfect than they now are. The gentlemen, however, who performed this work claim to know something about the habits of pike-perch and black bass. These gentlemen went to Montpelier at their own expense, and found there among the members of the Legislature a strong party who were determined to repeal the existing laws against net-fishing, etc., but after a hard fight this effort was defeated and several important amendments were passed and made laws. One amendment doubled the amount of appropriation granted to the Fish Commissioners, another amendment makes it compulsatory for the Selectmen in each town to appoint a fish warden, another amendment enlarges the powers of the wardens, etc., and as there was no law to prevent pike-perch and black bass being taken with hook and line, or troll at any season of the year, a law was passed making a close season for these fish from Feb. 1 to June 15, which dates protect these fish during their spawning season, and allows them to recuperate so as to be fit for food. As bass and pike-perch are taken on the same grounds, it was deemed necessary to have the close season for both these fish to expire at the same date, otherwise the close season for pike-perch would not have extended beyond June 1.

Regarding the weight of a 10-inch black bass if measured accurately, 8 ounces is more than the average weight of that length bass. My tables say 6¾ ounces for a 10-inch bass.

Regarding what a fish warden can do, I will tell your readers what one of them, Mr. Atherton, of Waterbury, has done. Last year he seized nearly thirty large traps, nets and seines, and the State's share of the fines imposed on the owners of the nets amounted to five hundred dollars or thereabouts.

In conclusion I would say that every intelligent person knows that our game and fish laws must be made more and more stringent each year, but in Vermont we must creep before we can walk. We have done something toward improving the laws during the past session of our Legislature, and hope to do more next session. When pike-perch come into the tributaries of Lake Champlain in the spring of the year, they come into those streams for the purpose of spawning, and if not caught out or frightened out by nets, a portion of these fish will remain in the deep pools and in the rocky rapids during the entire season. The Missisquoi River is the great natural spawning grounds for these fish, and the writer every season takes them with black bass out of the same pools. STANSTEAD.

CHATHAM, N. Y., Feb. 11.—At the annual meeting of the Forest and Stream Club, held Feb. 5, the following officers were elected: President, C. Shufelt; Vice-President, C. H. Bell; Treasurer, F. S. Ford; Secretary, C. M. Harmon. Ken, during the past year won all the prizes, catching the largest bass and trout. Owing to one of the by-laws of the club, no member can take more than one prize the same year, therefore, T. R. and Call get two of them. Ken's largest small-mouth bass weighed six pounds six ounces. Call's trout turned the scales at fourteen ounces. This is a good-sized trout for our streams, as there are five fishermen to one fish. Ken has given up his favorite way of fishing for perch, which we call "belly-fishing," he calls it "pugg-ling." I think the Dominie and Call gave it this title. The reason of his giving it up is because one of his pupils has gone to fishing in the same way. The style is a peculiar one. They cut a hole through the ice, bait their hook, and then stretch out full length on their belly and drop the hook through the hole and watch for a bite. Old Bean says that is the way boys fish. I have seen Ken fish this way for hours and catch three or four small perch. This coming season we expect to have a grand good time, as part of the club are going to the North Woods to spend two or three weeks in hunting and fishing, and when we return you may hear from us. We shall start from here and drive there with teams, taking our provisions and everything we shall need for our camp, making numerous stops on the way.—C. M. H.

LIGHT ON THE BIG TROUT QUESTION.—An angler's journal is publishing a series of letters to prove that a brook trout weighing twenty-four pounds was caught in Maine in 1849. There is nothing very remarkable about it. As a trout generally increases in weight at the rate of one pound an hour after being taken from the water by an angler, the Maine fish of 1849 should now weigh about 300,000 pounds. —*Bangor (Me.) Commercial.*

THE BIG PIKE.—North Middletown, Ky., Feb. 5.—"Will Montgomery," in his article on large catfish and pike in your issue of 29th ult., is in error when he states the big pike I mentioned some time ago was caught by a party from Pittsburgh. The pike I referred to was caught by a party from Bourbon county in Red River, Ky., and the gentlemen who composed the party are living in the county now.—LITTLE SANDY.

BLACK BASS PRESERVE.—In our advertising columns will be found an announcement of a black bass preserve in Orange county, N. Y., which is for lease. The gentleman whose name is appended to the card is an adept at taking bass in out of the wet, and his statements are to be relied on.

Fishculture.

FISHCULTURE IN NORTH CAROLINA.

WE have the third biennial report of Mr. S. G. Worth, Superintendent of Fish and Fisheries of North Carolina. Mr. Worth has for years been laboring to show the people of the State how great their fishery interests are and to induce them to preserve and increase them. By his energy in this line he has awakened much interest in the fisheries and has accomplished a great deal with the limited means at his command. He says:

"No argument could more emphatically prove the importance of fish diet to the consumer than the statement that more than 2,000 private fish ponds have been built in North Carolina within five years—ponds being built in ninety-one counties, including not only the midland but also nearly every Blue Ridge county."

Referring to the splendid exhibit of North Carolina fisheries at the New Orleans Exposition he calls attention to a card there displayed, which shows the income of the State's fisheries at a million dollars per year. "The most important species which make the great aggregate are the shad, herring (or alewives), bluefish, mullets, menhaden or fatbacks, gray and spotted trout [weakfish], spots and oysters. The first named species above, the shad, is extremely valuable. Occurring in January in our principal rivers, it ascends to the headwaters for spawning, and while scarce in the beginning of the run, gradually becomes more abundant in February, and most abundant in March and April. It is sought by all classes of fishermen with seines, pound-nets, gilling and dip-nets on account of its appearance at the most favorable market season. Prices as high as two dollars or more each prevail at first, and decline gradually to five and ten cents each about the end of April, while the average price throughout the four months for the entire catch is ten cents a pound. This is a high price, considering the abundant catch in Chesapeake Bay, between us and the markets. Taking the census, we find that no other State realizes more than eight cents a pound. Although this species occurs in the tributaries of the Albemarle and Pamlico Sound in company with immense schools of herring, which form a large money resource, it forms the important item the net profit of many large herring fisheries, and its ready sale to consumers in Northern cities, New York, Boston, Philadelphia and Baltimore, is draining heavily the natural supply."

Great difficulty has been experienced in obtaining ripe shad eggs, because the bulk of the fish are captured near the mouths of the rivers before they have been in fresh water long enough to ripen the ova. Beside this, the spawning shad must be captured after sundown, and the owner of a large fishery, where spawning fish might be obtained, forbids the men employed by the State to use their gill-nets there. In 1883 4,427,000 shad fry were planted and 2,065,000 in 1884.

Of oysters we read: "Our oyster industry, which is now small, has a golden opportunity of becoming great if we will but seize the occasion. The annual income from this fishery is now about $200,000 and can be increased to several million dollars a year if wise and liberal legislation is immediately secured. Eighty per cent. of the oyster trade of the United States is dependent upon Chesapeake Bay. The supply there is decreasing rapidly, and in a short time that eight million dollars' supply must come from another source, and where must it come from? Why not largely from North Carolina? So it can if we will attend to the matter now, but we cannot delay. Oysters are declining in all of the waters to the north of us except in Rhode Island and Connecticut. In all the other States the bottom is held as common property, but in these it is owned and controlled by individuals. While the oyster is deteriorating in all the other States and disappearing, it is improving and increasing in those States."

The report concludes with valuable papers on the oyster industry, which were read before the Fishermen's Convention, held in Raleigh, Oct. 16, by Lieut. Francis Winslow, U.S.N., and Prof. W. K. Brooks, of Johns Hopkins University, Baltimore.

FISHCULTURE IN YE OLDEN TIME.

A QUAINT old black-letter volume of which all who are familiar with angling literature have heard, and of which but few copies are extant in the great libraries, has been reproduced by that indefatiguable delver in angling lore, Mr. Thomas Satchell. It is entitled "A Booke of Fishing with Hook and Line," made by L.[eonard] M.[ascall], 1590.

The book is full of the quaint angling conceits of its time, and gives many instructions concerning the keeping of fish in ponds and of gathering spawn, although there is no hint of artificial fecundation. It says:

"A chiefe way to saue spawne of fish, in March, Aprill, and May, is thus, ye shall make fagots of wheate, or rie straw, all whole straw not bruised, or of reede, bind these faggots together with three bondes, and all about thereon sticke of young branches of willow. Then cast them into the water among the weedes, or by the bankes, and put in each faggot two good long stakes, driven fast to the ground, and let your faggots lie couered in the water halfe a yeard or more. So the fish will come and shed their spawne thereon, and then it will quicken therein, so that no other fish can come to destroy or eate it, and as they waxe quicke they will come forth and saue themselves. Thus much for preseruing of spawne in the spring and spawning time: this is a good practice to preserue the spawne of all scaled fish. These faggots ye may make and lay in all riuers, poundes, or standing waters. Your faggots had neede to be a yeard and a halfe long, and bound with three bandes not hard, two bandes a foot from the endes, and an other band in the middest, and lay them as I have afore declared. Also some do vse to hedge in corners in riuers and ponds with willow, and thereon fish doe cast their spawne and so breedes."

Other articles on fishculture are given, such as: "Here shall follow the knowledge how to replenish your fish pondes," "Of clensing your pondes from weeds, "Here shall be shewed a care of lauing your pondes in sauing the water where it is scant for to saue your fish alive," "There is a care alwayes to maintaine your pits and stuis with fish," "How to nourish your fish in pooles, mayers and standing waters," "To breede millars—thumbs and Loches in shallow brookes or rivers," with illustration, "The breeding of Creuis" (crayfish), and "How to breede and increase yeeles in riuers." We have enjoyed this quaint book and have been surprised, as other fish-culturists will be, at how much attention was paid to cultivating fish at that time, and how much the author knew of the matter nearly three centuries ago.

THE NEW YORK OYSTER COMMISSION.

THE report of Oyster Commissioner E. G. Blackford has just been presented to the Legislature. The oyster investigation was authorized at the session of the Legislature last winter, and has been conducted over a good portion of the oyster ground of the State during the past season. The report shows that the natural oyster beds have not only decreased in size, but also in productiveness in the portion of the territory examined, within a few years. Various causes are assigned for this, among them the dumping of garbage from the city, the unscrupulous working of them by some classes of oystermen, and the natural enemies of the oyster. To counterbalance the decrease of natural beds, there has been a decided increase in the number of beds cultivated by private parties, and this has kept the supply from falling off. The Commissioner does not think that the investigation has been carried on long enough to thoroughly decide what legislation should be recommended, and he therefore does not attempt to cover the whole ground. The recommendations which he does make are for the temporary protection of the natural beds, and for the continuance of the work now in progress until some final judicious regulations can be formulated.

He recommends that the work which has already been done be continued and completed by visits to the remaining portions of the oyster regions of the State. That the researches into the conditions which promote the growth and affect the flavor of the oyster, and as to the best methods for increasing the supply, which have also been in progress during the year, be continued. That a complete survey be made of all oyster lands within the limits of the State, so that there may be some authentic record of the amount of our oyster territory as a whole, as well as the size and character of each individual plot or bed. This will also serve as a basis to work upon in case the State should in future take charge of the lands, and deed or lease them for planting purposes. That a codification or compilation be made of all the State, county and town laws regarding oyster beds or oyster cultivation, which are in force within the limits of the State at the present time. That a legal decision be obtained, if possible, with especial reference to the rights acquired by virtue of old patents issued to individuals as representatives of various townships, to lands situated under water which are in unobstructed connection with the high seas and open to public traffic. That a series of laws be drafted for presentation at the next Legislature which shall be as uniform in character as possible, taking into consideration the varying conditions of the different sections of our oyster territory, and which shall be designed to regulate and control the oyster industry and oyster traffic of our State waters. That, during the continuance of the investigation, and from the first day of February, 1885, until these laws are presented to the Legislature and are acted upon by it, no changes whereby the new territory shall be occupied for the purpose of oyster culture, will be recognized as valid.

The report is not yet published, but is expected soon. There will be a great demand for it in the regions where the oyster grows, and many will anxiously look to see what the Commissioner has recommended.

THE VERMONT COMMISSION.—The biennial report of the Fish Commissioners of Vermont for 1883-'84, is at hand. It opens with a history of the German carp, and quotes from the United States Commission as to their character and qualities, and gives a list of persons in Vermont to whom the fish have been distributed. The black bass receives attention, and directions for its capture are quoted from Mr. H. F. Norris, of New Hampshire. The Commission has aroused public sentiment, and aided the protection of fish already planted, and reports of fish wardens are given. In the work of F. H. Atherton and J. L. Tuttle we find a record of the seizure of seventeen pound nets, six fykes and five seines, and the arrest of eight men, between March 26 and July 28, 1884. An appendix gives the laws for the preservation and propagation of fish, game and birds.

The Kennel.

FIXTURES.

BENCH SHOWS.

March 5, 1885.—World's Exposition Dog Show, New Orleans, La. Entries close Feb. 23. L. F. Whitman, Superintendent.

March 18, 19 and 20, 1885.—Second Annual Show of the New Haven Kennel Club. E. S. Porter, Secretary, New Haven, Conn.

April 21, 22 and 23.—Annual Dog Show of the St. Louis Gun Club. W. A. Albright, Secretary, St. Louis, Mo.

April 28, 29, 30 and May 1.—Ninth Annual Dog Show of the Westminster Kennel Club at Madison Square Garden. Entries close April 14. James Mortimer, Superintendent, 48 Broad street, New York.

May 5, 6, 7 and 8, 1885.—Second Annual Dog Show of the Cincinnati Sportsman's Club, Cincinnati, O. W. A. Coster, Superintendent.

May 13, 14 and 15.—Third Annual Dog Show of the Toronto Dog Show Association. W. S. Jackson, Secretary, Toronto, Ont.

June 2, 3, 4 and 5.—First Annual Dog Show of the Illinois Kennel Club, John H. Naylor, Secretary, 3,182 Archer avenue, Chicago, Ill.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc, (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **2113.**

EASTERN FIELD TRIALS CLUB.

THERE was a meeting of the Board of Governors of the Eastern Field Trials Club at the St. James Hotel, New York, on Feb. 10. The treasurer's report showed that the receipts last year were $3,010.40 and the expenditures $2,590.-73, leaving a balance on hand of $419.67. The names of Messrs. Pierre Lorillard and Henry B. Livingston, New York, were proposed for membership. The resignation of Mr. Charles Heath, Newark, N. J., was accepted. It was voted that the president appoint one or more members to constitute a committee with himself to revise the running rules. It was voted that the Derby of 1885 should be under the same conditions and with the same prizes as last year. The purse is $500, with $250 to first, $150 to second and $100 to third, entries close May 1, with $5 forfeit and $10 additional to starters. The following additional conditions were adopted and the secretary was instructed to advertise them with the notice of the closing of the entries:

For the protection of breeders and owners of thoroughbred dogs no entry will be accepted unless accompanied by a certificate signed by the owner of the sire of the entry, stating the date when the dam was served and a like certificate from the owner of the dam, stating date of whelping. The secretary was instructed to communicate with the agent of the Associated Press and learn if arrangements could be made for a daily report of the trials.

N. A. K. C. RULES.

Editor Forest and Stream:

The now most worshipful A. K. C. came into being in response to a restiveness at absurd, contradictory and sometimes suspicious actions of dog show managers and judges. It was felt that there must be somebody to pass on such cases, and exercise a controlling influence. In their infancy dog shows did well enough with Charlie Lincoln as everything, but we have got past that. The exhibitor has come to feel that he has some rights that even their majesties "The Committee" should respect, and the "pointer protest" and "mastiff puppy" cases showed plainly that if these rights were disregarded "The Committee" would hear of it.

Unfortunately the above cases and the W. K. C.'s reply to Mr. Mason, wherein they shirked a duty by dodging behind Rule 12, shows that the managerial mind has not yet taken in this idea. In the last case Mr. Mason was performing a duty to dog showing by pointing out flagrant violations of the rules for government of the show. The W. K. C. probably thought, "Mr. Mason, you sadly disturb our peace by bringing disagreeable matters to our notice. Will you please go to—China?" But why in the world didn't they say so? And not decline to investigate an alleged wrong entry, etc., because they had a rule to protect them from having to pay a prize twice.

One of the chief evils of shows has been absurd decisions on rules. What has the A. K. C. done to remedy this? Honestly, not an iota. They have issued a lot of show rules, jumbled to excess, about the common premium list rules, with the childish "extra" idea, and the knavish Rule 17. I suppose the editor of *A. K. R.* feels constrained to be dignified and courtly in expression, or he would never have dealt with the rules in such kid-glove style. They are simply a string of half-digested rot, full of omissions, and with no new features except the "extra" and Rule 17 kinks. The ordinary course pursued in such cases is to appoint a committee to revise or report rules, and then consider, amend or approve them. In this case the practice seems to have been to patch and tinker at the old rules, and then swallow them blind. I suspect that the real secret was that the inspiring minds were so intent on rigging up Rule 17, so as to suppress Mr. Mason, that they had no time for anything else. If I mistake not, the "extra" idea is a maggot of the "constructing" president's own hatching. But not content with doing nothing to cure the evils of hap-hazard rulings, we are treated to a refinement of them, now famous as "construction." I challenge your readers to quote another instance of such preposterous overturning of a rule as Major Taylor's "construction" of Rules 8 and 9. In effect he said that he repealed an old rule and enacted a new one. The editor of the *A. K. R.* may say as much as he pleases about the rule being intended to operate just as it reads. All the exhibitor cares for is how it does read, and that and its meaning is plain as day.

However, to improve on perfection of stupidity, our "constructor" calls a meeting of the Executive Committee at three days' notice. The "committee" (?) undertakes a proper "construction," and succeeds in making soot very much blacker. The secretary reports the meeting, and does not say where it was held nor who were present; so I am quite sure your idea that it was held in Cincinnati and that the representation was by proxy is all wrong. Such "construction" could only have proceeded from a meeting in the moon.

Now, in behalf of the public, I would inquire of the A. K. C. what is at the bottom of "construction"? Is your president so lacking in comprehension of common English that he cannot understand the wording of Rule 8? If so, he is evidently unfitted for his position, and should be relegated to judging setters. Does he think his wishes of more weight than the express rule of the club? Another reason for the same relegation. Or, worst of all, was this "construction" for the purpose of favoring some particular dog or dogs? Ah! if this is the case, the usefulness of your president, both as president and as a judge, is wrecked forever. Understand me, I bring no charges, as I have no evidence; but, gentlemen of the A. K. C., you must take this matter up. If you wish your club or yourselves to retain the confidence and respect of the canine world, you must lift your club out of the slough "construction" has dumped you into. You cannot afford to lie under the suspicion of condoning your president in either of the alternatives. It might also be well to inquire by what authority the Executive Committee presume to interpret rules. A rule derives its force from its promulgation by the association, and the province of an executive committee is sufficiently defined by its name. Most of us are chock full of suggestious for remedying existing evils, for promoting shows and their usefulness; but what is the use of submitting our cherished bantlings to a club that allows its president to publicly announce that b-l-a-c-k spells white?

As all who know him look to Mr. E. S. Porter, the secretary of the A. K. C., for plain common sense, I intended to put him on the stand and inquire what the New Haven Kennel Club propose to do with "construction," Rule 17, etc.; but their prompt display of anti-"construction," and their refreshing independence in appointing Messrs. Mason, Davidson and Watson as judges, gives them no uncertain sound. The N. E. K. C. have done well in their selection of Messrs. Watson, Apgar and Barlow, but their dallying with "construction" has a suspicious look, and unless they take warning from the signs of the times, Mr. Nickerson may find a reason for "owners of the best stock" delaying their entries. W. Wade.

Hulton, Pa., Feb. 21, 1885.

A GRATEFUL DOG OWNER.

Editor Forest and Stream:

The instances of a man's, whose pet dog has been picked up when lost, or wandering, being imposed upon in the way of expected or demanded reward, are so common that when a case occurs where the boot pinches on the other leg, it seems to me worth recording. I was standing on the rear platform of a Cambridge horse car to-day with my dog following. After the conductor (a bright and smart looking young man) had collected his fares, he addressed me as follows: "I see you watch your dog very closely, sir." I replied that I should be very sorry to lose him. "I suppose," said he "if you should do so and somebody brought him back to you, you would thank them." To this remark I answered that under such circumstances in the past I had so often had to give something more substantial in addition to thanks, that I was very careful not to let my dog get out of my sight, and as I saw that he evidently had something to tell, I drew from him (with very little difficulty) the following statement.

"A day or two ago," said he, "on my outward trip, when my car was just about where we are now, I noticed a very handsome Irish setter following the car. I had not seen his owner get on, but supposed that he must have done so, until we got to the Square, and the passengers all having left, I saw that the dog was alone. He was a well bred dog, well groomed, and had a very nice collar on, and as I noticed that the hostlers and switch tenders had dropped to the fact of a nice dog being lost, I got a piece of string and tied him up in the office, leaving him there during my next round trip.

When I got back I bought some meat, took him home and fed him, as he was very hungry and dry, and when I got through my day's work, as I found his owner's address on the collar [giving the name and one of our most expensive and fashionable hotels as the residence], I thought they would be worried, and that it would be a kindness to take him home rather than put them to the expense and trouble of paying for an advertisement and sending for him. So I took him to the hotel, asked for Mr. So-and-So, and would you believe that, although they were very glad to see the dog, they never even said that they were obliged to me for the trouble I had taken?"

Now, that gentleman has not only accepted the gift of a few cents from a man who has to support a family on $1.75 or $2 a day, and taken a couple of hours of his time out of the very small proportion of the twenty-four that they have for rest and enjoying the society of their wives and children, but he has done me and every man who owns a dog a positive injury, as my friend the conductor and all his friends will think twice in the future before putting themselves out to return a stray dog to its owner. Of course there are two sides to every story, but I do not see what the other version of this one can be. McMac.

Boston, Mass., Feb. 15.

POINTER BREEDING.

Editor Forest and Stream:

Your issue of Jan. 29 contains a communication from Chas. H. Mason entitled "Pointer Breeding," which is a reply to mine of earlier date. Mr. Mason cannot beg the question nor escape the bench show and field trial record of 1884.

I did not mean to say of Chancellor, field trial champion. I used the word with an interrogation point, which the printer inadvertently omitted.

Mr. Mason says I insinuated his dogs were not pointers. Well, sir, I had my doubts, never having heard of their distinguishing themselves by doing a pointer's work.

Mr. Mason denies that he spoke disparagingly of American sportsmen, and challenges me to produce the record. Here it is. In an article published May 12, 1883, he says: "I speak but the truth when I say I have not seen a judge of pointers since my arrival in America, two years ago. There are, I believe, a few practical men to be found, but the majority are upstarts," etc., "who *cannot distinguish the difference between a pointer and a foxhound*" (italics mine).

Let us hold to the point; and the record proves I am right. When Mr. Mason attacked Croxteth in 1883, he denounced him as worthless and unfit to breed to: even questioned his pedigree, and predicted ruin and disaster to the pointer interest, from which it would take years and years to recover.

Now I assert, and the press has said in substance, that the pointers shown during the past year were, as a whole, the best ever seen in this country. And the record proves that Croxteth has contributed a large share toward improving and raising the quality and standard of our pointers.

Mr. Mason begs the question when he says: "Jilt and Lady Croxteth are not first-rate bitches, and that there was not a first-rate pointer bitch at the New York show." Then he cites Water Lily as an illustration, and to prove what a poor lot the large pointer bitches of this country are, he tells us she was only commended at the Birmingham show: "There being seven others ahead of her, and *she got all she deserved*" (italics mine). The language implies that her position in the class was due to her individual imperfections. If Water Lily got all she deserved, she would, according to Mr. Mason's statement, be only sixth-rate, and does not score over 75 points out of a possible 100.

When Mr. Mason made the above statement he uttered a libel against the large pointer bitches of this country, and the gentlemen who have judged those classes at bench shows, by implying that they gave first and champion honors to an animal scarcely worth mentioning. The fact is an animal need not be perfect to be first-rate, provided the faults are of the negative kind. What Mr. Mason expected to prove against Croxteth's get by bringing in Water Lily is not apparent, as she did not beat Jilt. Vanity won the special prize for best pointer bitch in the New York show; so it follows that Water Lily was beaten. As before stated, Mr. Mason declared Jilt to be the best bitch in show, and now says, "So far Croxteth is the sire of two good-looking bitches—Jilt and Lady Croxteth—but they cannot win over such bitches as Mr. Lloyd Price's Bow Bells." Will Mr. Mason tell us how many bitches he knows of that can win over that famous champion? When it is remembered that Bow Bells is the best bitch ever got by old champion Bang, and that she has never been beaten, but has held the championship of England for years against all comers, and is in fact perfection, but for a little throatiness, it becomes apparent what really magnificent beauties Jilt and Lady Croxteth are. Mr. Godeffroy may well be proud of his favorite when he gets such stock.

Mr. Mason says, "Croxteth almost invariably stamps his structural faults on his get." I deny that. As Mr. Mason is not a practical sportsman, but a dog fancier and a showman, he occupies a position from which he may legitimately criticise the "beauty points" of dogs. But when he attempts to discuss the structural form of the pointing dog he leaves that vantage ground and enters a field on which every practical sportsman is at home; and there Mr. Mason's experience does not warrant him to speak authoritatively. Mr. Mason thinks I was joking when I wrote that not one of Beaufort's get had been considered good enough to start in a field trial, and gives as a reason why they have not shown up there, that the dog has not been long enough in the stud. But just previously he said Beaufort sired the first, second, third and he winners at the Washington show, also the winning bitch and pup at the New Haven show, also Fritz, first at New York. As Beaufort will be six years old in April, and Fritz four years in May, and as these shows were all held in the spring of 1884, it is apparent that the dog has been in use, and has been bred from for the last four years. Try another argument, Mr. Mason, after awhile you may blunder on to the true reason why Beaufort's get has not showed up at field trials.

Mr. Mason charges certain structural defects to Croxteth's get, which if present to the extent he says they are would seriously handicap those dogs in a field trial. I will now give Mr. Mason an opportunity to demonstrate what he says, or I will prove that he is not only a false prophet, but one who has not the courage of his alleged convictions.

Mr. Mason writes: "How many of Croxteth's get had run in a field trial twelve months after Mr. Macdona landed with him in America? Try again, 'Saxon.' Unfortunately I [Mason] do not own any of Beaufort's get that are old enough to compete against Croxteth's; but I know where to find them. * * * I will show two young dogs by him against anything 'Saxon' can produce, either for money or a handsome piece of plate, $100 forfeit, * * * or I [Mason] shall be glad to entertain any reasonable proposal 'Saxon' may make."

Very well; here is my proposal: I will match one, two or three brace of Croxteth's get against an equal number of Beaufort's in a field trial race for $1,000 a side, $250 forfeit; the race to be run as early as convenient, under the Eastern Field Trials Club rules. To save valuable time and facilitate matters (as I am a thousand miles or more away from New York) I will nominate a New York pointer owner, who will act for me in arranging all the details as to time, place, judges, referee, etc. Saxon.

ENGLISH KENNEL NOTES.

XXV.

THE result of the Liverpool show is gleefully claimed by the Kennel Club as a point in their favor, because the show was for the first time held under their rules. Their rules or anybody else's rules, it is all the same, if you have good men to apply them. It was again a case of men, not measures; the success is due to the energetic executive, not the rules.

The arrangements of the first day were well planned and calmly carried out. In particular we, who had reporting work to do, were gratified with the intelligent celerity shown in posting up the awards; the pass-out scheme almost solves the re-admission difficulty.

The show was well patronized by the public, but the kennel world was not strongly represented. Among others I missed Mr. Langdale, but I see his editor found a hack to do his work.

Mr. C. Martin showed in the St. Bernard open dog class a litter brother to Plinlimmon. He is a grand young dog, but I doubt if he will ever be first-rate behind; he appears to have outgrown himself. With time and care it is possible that Peter the Great will win some prizes. Thetis, a noble daughter of Bayard, is framed to breed grand stock. Hers was a popular win.

Chieftain took the prize in a small class of deerhounds, and thus soothed his owner's Crystal Palace disappointment.

The knights of the slips had a good collection of their beauties to inspect; the judging though was very indifferent. The Palace winner was out of it. A bitch named Dorset received the admiration of the coursing men.

Collies, a very large entry, had the advantage of being judged by a man who knows his work. The consequence was a reversal or two faulty C. P. decisions. Young Cockie made his appearance again, but though he is not still quite the dog that won so many prizes at a Palace show, he was good enough to beat Rockingham and the rest. Matchless easily avenged her late defeat. Dahlia got her deserts, second prize. I thought the local class was unusually brilliant.

The variety classes were more than habitually interesting. The spectators were bewildered and bewondered at such curious creatures as the antediluvian terrier, Old Adam, who has seen a great deal of the world; Rallie, the rough French hound, and Piston, a rare specimen of some foreign breed.

Good fortune and zeal have combined to rescue the Liverpool show from impending oblivion, and this year's visitors will look forward to another merry meeting with the cheerful circle of officials.

The Dachshund Club (how do you like darxhoond for the pronunciation?) have published their entries for the 1885 produce stakes. Twenty-three bitches can be called a fair total, though it oddly represents thirteen breeders. The largest entry is made by the stately and fair exhibitor Mrs. Merrick-Hoare. I am inclined to believe that the value of produce stakes is somewhat over-rated, for there are generally some better youngsters bred outside the stakes.

Our dead-alive, I mean *Live Stock Journal*, says that the effervescent Irish chaplain, Mr. O'Callaghan, has sold some of his stock in high quarters, at prices of similar altitude. The parsons are "coming it" fairly strong in the dog line. Now then ye Vanderbilts, Kaisers, Kings, and other personages, what d'ye lack? Rough or smooth, old or young, dog or bitch, come take your choice and pay your money, disestablishment is on the way. I wonder why the Emperor of all the Russias did not complete that talked of purchase, did the fluttering canon startle up a buyer nearer home for the Rev. A. Carter's Plinlimmon. 'Ware decoy ducks, Mr. Smith!

Mr. Vero Shaw, in his new article on the Scotch terrier, rather unkindly confesses that "it would be a useless task to try and convince his detractors that Scottie is a handsome dog." If one had only the illustration that accompanies his paper to go by it would be hard to contradict him. A very every-street couple they look, just big enough to kill a rat or feed a cat.

Mr. Ashwin's bad luck on the show bench put him in danger of being forgotten, he has averted that misfortune by issuing a circular to the members of the Collie Club soliciting their support in dividing the over large classes by colors. He draws attention to the fact that in January, 1884, a meeting of the club passed this resolution, "That the collie classes, having become so large, it is desirable at the principal shows the collies should be divided into two classes according to their color, viz.: black and tan, black, white and tan, black and white, and black, into one class, and sables, and any other color, into another class." The Kennel Club wisely declined to accept the suggestion and instead added several extra prizes. Mr. Ashwin would be glad if his proposal had the object of ridding us entirely of dogs with coats of an undecided color. I don't agree with him, as no points are given for color, a judge should hold that a good collie, like a good horse, can't be a bad color. Mr. Ashwin, when he insinuates that judges are generally influenced in favor of black and tans, is unsupported by most exhibitors who are strongly of opinion that at present there is a marked partiality, due to a passing fashion, for sables, and "pretty" dogs generally. He acts squarely up to the sapient advice of not prophesying until you know in saying he "expects the time is not far distant when three judges will be appointed." That step was resolved upon, I under-

stand, at a meeting of the club in the Palace for their specialist show to be held some time this year.

Mr. Ashwin makes an unlucky hit in choosing setters to illustrate his argument. Though the colors of setters are often mentioned, it is the difference of breeds that makes them distinct. I think this proposal is doomed, for though the fox-terrier classes have long exceeded collies and all other breeds in numbers, no such fantastic division has ever been hinted.

Lastly, I will compliment Mr. Ashwin upon one accurate deduction embodied in his statement, that the present high position (though very far from perfect) of dog shows is greatly due to the "disappointed exhibitor."

Now that the "Roving Highlander" has in your columns come to his rescue, I begin to pity Mr. Harston. "A plague upon such backing!" This unsettled child of Haggisland is surely the same restless soul that formerly wandered through columns of our papers over the fitting appellation of the "Raving, no "Roving, Scot." We had lost sight of the erratic wight who would ever clash and argue with anybody on a Scotch breed, because:

"It's guid to support Caledonia's cause,
And bide by the buff and the blue."

But it's all right, "R. H.," Caledonia is nae that fou that. She requires your support, and the politics you know, well they are as out of date as those of the people who in 1688 sang that they had

—"taken a sware,
Lillibulero, bullenalah.
Dat dey would have no protestant heir,
Lero, lero, bullenalah!

"Roving Highlander" gives you a description of his Highland or Glenlivet (I know an excellent whisky of that name, d'ye ken it G. M.?) sheepdog which must be a most fearful and gruesome beast, the sort of thing I should like to buy to shoot at.

There is something very touching in his complaint, "I have been one of the best-abused men living," but he quickly takes heart and concludes gamely, threatening to "show you some Scotch dogs on the American benches." Oh! you're in for it now. In my broad compassion I can forgive your Bunker Hill and even the Alabama claims.

I see Mr. Harston thanks the Scot for his support and wants Mr. Davidson to let him "call him a friend." Why not, certainly—"call him early," call him whatever you like but don't mislead American breeders upon the question of collies. And you, "Roving Highlander," cease your "wanderings," return to your stand outside the shop where in the good old-fashioned days you stood in national costume with wooden mien to advertise not your own poor vapors, but the pungent rappee inside. Good Highlander, get thee to a tobacconist's!

"Corsincon," in his "Things in General" and nothing in particular, has written a bright and friendly notice of "Lillibulero," whom he imagines to have seen with the aid of a medium at a séance. Put not your trust in séances oh, Hugh! It "gars me greet" (I have turned on the Scotch this time) to insinuate that the spirits have played an alcoholic prank upon the doggy "Paladin of the Fen," and I am compelled to deny the phantasm. I have not "a charming mustache," my hand is not "natty" nor "little"—but I will own to the "self-complaisant air" which I have cultivated to study the mazy efforts of a busy crowd to solve what is after all, no riddle. Praise me and I will smile, discuss and denounce, but leave my identity alone. I am not a conundrum. What matters it who prepares the pickles, the sauce would taste as sharp by any other name.

The latest *on dit*, that however to the best of my belief is a fact, is that Mr. J. Bissell has raised the fee of his stud collie champion Charlemagne from ten to twenty guineas, and limited the number of services to thirty for the current year, and *mirabile dictu*, I am told the list is full. £600 a year from one collie! Verily, but if the dog be an unclean animal, unprofitable is he not, nor stale at his age.

There is much eccentricity mixed with an Englishman's charity. The last thing I have been asked to subscribe my hard-earned mites to, is "The Anti-Cruelty to Animals Society on the Rivièra." Can't the Italians look after their own brutes? Where is their erst famed champion, the authoress of Puck and That Dog of Flanders!

The Dandie Dinmont Club shows signs of returning animation. They have captured a right honorable lord for their patron and an earl for president. That's the way to do it; there's nothing like a good figurehead, it's purely ornamental, it does not assist the ship's motion, but it gives the crew a swagger. In looking for lords you must be sure you get the right sort, those of worldly wealth, for a poor lord is no use, he is a great expense—in fact, only the richest societies and individuals can afford to keep a tame lord. This Dandie Dinmont Club particularly calls itself, I notice, the "Southern Branch." Why, whence? "No scandal about King Corsincon, I hope!" Anyhow, they have an influential list of members and are busy in holding meetings.

There is a talk of resuscitating the Spaniel Club. Mr. Cowell, late honorary secretary of the York show, has taken it up, so there is a good chance of its success. It is a pity that Mr. Bowers, whose name is so familiar in the breed, should have made himself so impossible by his offensive conduct toward that hardworking, underpaid and overkicked gentleman, Mr. Holford, who was honorary secretary to the former Spaniel Club.

Looking through the Hanley schedule of prizes I have come across the last outward and visible sign of Mr. Fred Gresham's imbecility. He has positively persuaded the easy-going proprietors of the *Live Stock Journal* to offer a free subscription to their paper as a prize. It is incredible that a respectable organ should descend to an act so mean, so little, for the sake of advertisement. Where was the inert tact of the able editor-in-chief, Mr. James Macdonald, when this ridiculous and contemptible idea was proposed to him? The thought is worthy of Mr. Fred Gresham, and of nobody else in the whole doggy world.

"Wildfowler" has been quick to expose the ridicule of the scheme and this week gravely offers to every show two subscriptions to his paper, one to be awarded to the worst sporting and the other to the worst non-sporting dog in the show. It is unlikely that any decent judge will lend himself for such undignified and clap-trap purposes. "Wildfowler" makes the offer with his tongue in his cheek, Mr. Fred Gresham makes the offer in shame-faced earnest.

The *Stock Keeper* has closed the correspondence and summed up the Crown Prince paternity case. It is dead against the club. Though there has been more wool and less cry it has not saved the cook a roasting. I think there are two far-fetched jokes in that sentence.

A letter from Mr. Joplin in the *Sporting Times* appears to have (purposely, probably) escaped notice over here. He affirms and gives his witness that while the deerhound awards were being made, at the late Crystal Palace show, two other persons were in the ring and assisted the judge in his decisions. "One of the men who was praising the merits of the first-prize dog turns out to be the owner." Bevis was the winner, but I can scarcely credit that Mr. H. Stephen would so far forget his position as secretary and manager as to behave in the manner indicated. "Wildfowler" is a good hand at "feeding" a correspondence, why was this allowed to drop? I have to thank "Wildfowler" for taking my hint, he now gives "Lillibulero" the credit when he does him the honor to quote his remarks.

On cutting the leaves of my *Stock Keeper* to find a letter I had written on the "no re-admission without fine" question at the Kennel Club shows, I was overwhelmed with modest confusion to find that in the gossip, the correspondence and the leader columns, the topic of the week was the old song, transformed to a peanism, to the tune of LILLIBULERO.

FEB. 9, 1885.

THE SCOTCH COLLIE.

Editor Forest and Stream:

I have observed in one or two recent numbers of the FOREST AND STREAM some letters incident to the Highland variety of the Scotch collie. On some points those letters were reliable and calculated to give Americans a correct knowledge of the Scotch collie and its dissimilitudes; on other points they were entirely unreliable.

I do not know who "A Roving Highlander" may be, but one thing I am certain of, he has been roving so long that he has forgotten how to spell the word collie. I never saw nor heard of the word being spelt colley. I was born and have always lived in the Highlands. I have devoted a deal of time and money in the breeding and perfecting of collies. I have reached high eminence in the pursuit, as the different prize lists demonstrate, and never have I heard the word spelt colley.

Now, I should like to touch on another point, also in "A Roving Highlander's" letter. The Highland collie, as described by him, is not the Highland collie, but the English bobtail. The Highland or north country collie differs from the Lowland or south country collie only in a few respects, the chief of which are as follows:

Smaller all over and lighter in the bone. Shorter and more wiry-coated. The color is almost invariably black and tan. The head should be finely moulded and must not show the least heaviness in the nose, as that at once smells of the Gordon setter. The ears should be small and set on as like the fox's as possible.

I have only lately arrived in this country and I imported a typical specimen of the pedigree Highland collie. She has all the points that I speak of, and received general admiration at the recent Fanciers' show.

Before closing I should like to touch on one other point.

When visiting the kennels of one of your most famous collie breeders a few days ago, I was surprised to see one or two of his best dogs with heather claws. When I spoke of them the breeder did not even know what they were. In case some of my readers may be in the same predicament, I will describe them. They are common claws, situated about two and a half inches from the foot, on the inside of the hindlegs. Now, in our country, the presence of "heather" claws lessens the chance of a dog obtaining a prize. I myself at a recent dog show in Scotland had a collie bitch which lost first place simply because it had those deformities. I may state that she was bred by a man who knows little about collies. Now, the way to remedy this fault is to cut the heather claws off when the pups are quite young. In cutting care should be taken to use charp scissors, and to cut smooth with the leg.

As far as I can judge during my short stay on this side, you have some capital dogs, but the selection of collie judges has been most unsatisfactory. Now, this is a thing that should be seen to and remedied, as if not it is apt to discourage collie breeders. From reports I understand that the selection of judge for the New Haven show has given general satisfaction.

Hoping that the foregoing remarks may be interesting to collie breeders in this country, I remain, etc., SCOTSMAN.

THE IRISH TERRIER GARRYOWEN.

Editor Forest and Stream:

Your issue of Jan. 22 is just to hand. I notice that your correspondent "Lillibulero" mentions my name saying that I have been spoken of in one of your journals as the "great faker." A friend of mine some time ago sent me a copy of one of your contemporaries, in which he spoke of some person—who had the Irish terrier Garryowen returned to him because the paint had worn off his nose—as the "great faker." As I never had Garryowen returned to me by any person for the reason stated, I clearly cannot be the person referred to. I bred Garryowen, also his father and granddam, and from a puppy to the day I parted with him, his nose was black, and furthermore, I never bred an Irish terrier with a white nose. The present owner of the dog (Dr. Niven) saw the dog at my place here before he ever went to America, and his nose was then black. Garryowen is sire of Garryford, for whom I was offered £50 by a gentleman here acting on behalf of a gentleman in Canada, and Garryford in turn is sire of Gilford, who is about seventeen months old and has won eight first and two special prizes, the only times shown, and he never was shown twice under the same judge. I inclose $5 for the Lincoln fund.

WM. GRAHAM.

NEWTOWNBREDA, Belfast, Feb. 3, 1885.

NEW HAVEN DOG SHOW.

Editor Forest and Stream:

The New Haven Kennel Club has established a class for greyhound puppies, and has decided that in all other puppy classes when ten or more entries are received they will be divided, dogs and bitches.

E. S. PORTER, Secretary N. H. K. C.

NEW HAVEN, Conn., Feb. 23.

VETERINARIES IN ENGLAND.—*Editor Forest and Stream:* My attention has just been called to a rather flattering notice of myself by your correspondent "Lillibulero," in his report of Dr. Forbes Winslow's sale, but he has made a misstatement that is likely to do me an injury. As your paper is read by a large number of both horsy and doggy men who have known me for a long time as a veterinary surgeon, and some of them may not know that I have a right to the title, given me by the Council of the Royal College of Veterinary Surgeons, London, England. "Lillibulero" is in error with regard to anybody over here being allowed to call himself a veterinary surgeon. Any one so doing, whose name cannot be found upon the register, is liable to a fine of £20. I feel sure from the jocular style of your correspondent's letter that he is a good sort of a fellow, and trust that he and I will be none the less friends through my endeavor to put him and myself right in this matter. Now, sir, I will just ask you and your correspondent a question that I think you will both, as just and honorable men, answer in the negative. Do you think it right to publish in a widely circulated journal a probability about a man without first assuring yourselves that it is a reality? With regard to breeding fox-terriers, I have kept and bred them for more than twenty-five years, and have had a long list of winners on the show bench. I have still a good kennel, containing one champion dog, a winner of seventeen first and extra prizes, including four championships. I have also kept and exhibited with success bloodhounds, greyhounds, dachshunde and spaniels, some of which I have given and obtained very high prices for. Trusting to have the pleasure of your better acquaintance, I beg to subscribe myself with the title your correspondent thinks I have no right to use.—J. R. WHITTLE, V. S. (Hayes, Middlesex, England, Jan. 17).

A WHOPPER.—Portland, Oregon.—*Editor Forest and Stream:* I clip the following from the New York *Sun* of Jan. 24: "A $3,000 Dog. Hurleyville, N. Y., Jan. 23.—Daniel Lonsberry has purchased the old and celebrated dog Trailer of S. Applebee for $3,000. Trailer is 40 inches high, stands on his legs as straight as a terrier, and carries his 215½ pounds of bone and muscle with surprising ease and activity." Will you be kind enough—if the facts are known to you—to tell me what breed of dog this is, and whether dogs of any breed 40 inches at the shoulder are often seen? The largest dogs I have ever seen or heard of are the rough-coated St. Bernards, and I never saw one of these that was more than 32 inches high. I am told that the celebrated St. Bernard Rector now owned by Joseph Emmet, of Albany, N. Y., is 35 inches high at the shoulder, and is, without doubt, the largest dog now living. If this dog Trailer is 40 inches high and weighs more than 200 pounds, I think Rector will have to look to his laurels. My particular "hobby" is a gigantic dog, and so I wish to know of this new wonder.—ALPHA. [If a dog 40 inches high at the shoulder has lived to old age without notoriety, it is more wonderful than the fact itself would be.]

A CARD FROM MR. MORTIMER.—*Editor Forest and Stream:* Will you favor me by kindly inserting the following explanation why I refused to accept the classes assigned me by the New Haven Kennel Club? About three weeks ago I received a letter from Mr. Porter asking me if I would judge at their forthcoming show, and plainly intimating that I should choose my own classes. To this I replied that I should like to judge at New Haven, but that I thought the Westminster Kennel Club intended making an exhibit there, in the event of which I should not feel at liberty to do so. Judge then of my surprise when week before last I received a telegrom Mr. Porter saying that deerhounds, greyhounds, etc., were assigned to me. This without the slightest consultation with me as to the classes I would prefer to judge, or as to associate judges. I at once replied by letter, declining the proffered honor. Mr. Porter will bear me out in what I here state, and contradict the statement made in a contemporary that I attempted to dictate to him or to the association he represents.—JAMES MORTIMER, Supt. Westminster Kennel Club (Feb. 17).

PHILADELPHIA KENNEL CLUB.—Philadelphia, Feb. 21.—*Editor Forest and Stream:* At a meeting of the Philadelphia Kennel Club held Feb. 17, 1885, the following resolution was adopted: "*Resolved*, That Wm. H. Pierce, Glencho Kennels, Peekskill, N. Y., be disqualified from exhibiting any dog or dogs at any bench show held under the auspices of this club until Jan. 1, 1887." This action was owing to the entry by Mr. P. of the red Irish setter bitch Reeta, the property of Mr. James T. Walker, Troy, N. Y., as one of his kennel, which was awarded the kennel prize.—WM. H. CHILDS, Acting Secretary Philadelphia Kennel Club.

AMERICAN ENGLISH BEAGLE CLUB.—The following is the result of the late election for officers of the A. E. B. C.: President, W. H. Ashburner, Philadelphia, Pa.; Secretary and Treasurer (by appointment of the Executive Committee), F. W. Wheaton, Wilkes Barre, Pa. Executive Committee—F. D. Hallett, Winsted, Ct.; Dr. J. W. Downey, New Market, Md.; J. M. Bergold, Canal Fulton, O. On account of the declinature of the nominee for the office of secretary and treasurer, that office was filled by appointment of the executive committee, according to Article IV. of our constitution.—A. C. KRUEGER, Ex-Secretary and Treasurer (Wrightsville, Pa., Feb. 18, 1885).

DOGS LOST.—Dr. G. A. Williams has lost his white setter dog, he had on an alligator collar with Mr. Williams's name engraved on metal. This dog has three lemon spots about the size of a nickel and in the form of a clover on the top of his head, also a lemon spot at the root of tail. Any further information gladly received.—FLICK FLICK....Mr. Raleigh C. Thomas, 82 Chase street. Baltimore, Md., lost, on the 14th of December last, his blue belton English setter dog. One side of his head is black and the other side bluish gray, he has a black mark at root of tail. A reward of $25 will be paid for his return.

"WILDFOWLER."—Monticello, Jan. 10, 1884.—*Editor Forest and Stream:* In February, 1884, I bargained with Lewis Clement ("Wildfowler") editor of the *Shooting Times*, London, England, for a beagle dog, which he agreed to send me on receipt of $80, delivered in New York port. I sent him the money by draft, which was paid to Clement on the 4th day of March, 1884. He kept both the dog and the money, $80, and will not reply to several letters which I have written him.—C. F. KENT.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death
6. Name and residence of owner, buyer or seller,
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Honest Bert. By E. Holley, Jr., Hudson, N. Y., for liver, with white on breast, cocker spaniel bitch, whelped May 30, 1884, by Chance (Don—Flossy) out of Fly (Baby—Fido).

Ferryman, Roiter, Fidget and Flighty. By Thos. Goode Tucker, South Gaston, N. C., for Byron foxhounds, whelped Jan. 23, 1885, by Rouse (Racket—Trouble) out of Fanny (Watchman—Nelly Hardy).

Blaze. By Jas. F. Johnson, Brooklyn, N. Y., for black and white cocker spaniel dog, whelped Sept. 30, 1884, by Ober (A.K.R. 855) out of Bessie (Captain—Toss).

Glen Ada, Glen Ola, Glen Elly, Glen Lass and Fairy Glen. By E. W. Jester, St. George's, Del., for three lemon belton and two blue belton English setter bitches, whelped Nov. 22, 1884, by his Glen Rock (A.K.R. 1616) out of his Blue Belle (A.K.R. 99).

Lady Ellen. By Geo. A. Rose, Schenectady, N. Y., for black, white and tan English setter bitch, whelped July 10, 1884, by Mike (Decimal Dash—Donner's Bessie) out of Fanny (Count Noble—Whitman's Flirt).

Keen Scent, Quail B., Romping Peggy, May Dale, Daisy C., Elfie and Hinda. By Ravenswood Kennels, Boston, Mass., for black and white English setters, two dogs and five bitches, whelped Jan. 25, 1885, by Dash III. out of Nellie Dale.

Brigadier. By N. Palmer, Baltimore, Md., for liver and white ticked pointer dog, whelped July 29, 1883, by Beaufort (A.K.R. 694) out of Coulson's Lillie.

Wonder. By Jas. A. Cathcart, Atlantic City, N. J., for red Irish setter dog, whelped Jan. 26, 1885, by Chester (Duke—Brownie) out of his Lady Bess (Dash Elcho—Bess).

Diamond Gladstone. By Chas. York, Bangor, Me., for English setter dog, whelped July 19, 1884, by his Gun (A.K.R. 1538) out of his Pearl Blue (A.K.R. 1542).

Forest Hill Kennels. By Chas. York, Bangor, Me., for his kennel of Llewellyn setters.

BRED.

☞ *See instructions at head of this column.*

Brier—Royal Blue. Dr. F. B. Greenough's (Boston, Mass.) English setter bitch Brier (A.K.R. 101) to A. Flagg's Royal Blue (Gladstone—Mersey), Feb. 1.

Pearl Blue—Gun. Chas. York's (Bangor, Me.) English setter bitch Pearl Blue (A.K.R. 1542) to his Gun (A.K.R. 1538), Dec. 8, 1884.

Zelpha—Puck. Henry C. Burdick's (Springfield, Mass.) Italian greyhound bitch Zelpha to E. W. Jester's Puck (Silk Socks—Naughty), Jan. 22.

Fannie—Rob Roy. J. K. Yore's (St. Louis, Mo.) imported collie bitch Fannie to J. A. Long's Rob Roy (A.K.R. 334), Feb. 13.

Fly—Colonel Stubbs. E. Holley, Jr.'s (Hudson, N. Y.) cocker spaniel bitch Fly (Baby—Fido) to Colonel Stubbs (A.K.R. 303), Feb. 1.

Dolly D.—Sambo. Samuel S. McCuen's (New Orleans, La.) pug bitch Dolly D. (A.K.R. 1445) to his Sambo (A.K.R. 572), Feb. 14.

Miss Georgie D.—Sambo. Samuel S. McCuen's (New Orleans, La.) pug bitch Miss Georgie D. (Little Boffin—Jennie) to his Sambo (A.K.R. 572), Feb. 1.

Spider—Skye. Samuel S. McCuen's (New Orleans, La.) Skye terrier bitch Spider (Smut—Topsy) to his Skye, Feb. 11.

Birdie II.—Duke. J. W. Stairley's (Butte City, Mont.) English setter bitch Birdie II. (Sam—Birdie) to Dr. B. Robinson's Duke, Nov. 3, 1884.

Hornell Ruby—Obo II. Hornell Spaniel Club's (Hornellsville, N. Y.) cocker spaniel bitch Hornell Ruby (A.K.R. 67) to champion Obo II. (A.K.R. 432), Jan. 28.

Dinah W.—Black Pedro. J. P. Willey's (Salmon Falls, N. H.) cocker spaniel bitch Dinah W. to his Black Pedro (A.K.R. 1474), Jan. 25.

Blackie III.—Obo II. J. P. Willey's (Salmon Falls, N. H.) cocker spaniel bitch Blackie III. (A.K.R. 428) to his champion Obo II. (A.K.R. 432), Feb. 17.

Kitty—President. Geo. Vaughn's bull-terrier bitch Kitty to E. S. Porter's President (A.K.R. 1208), Feb. 21.

Abbess II.—Bonivard. Geo. H. Hill's (Cincinnati, O.) St. Bernard bitch Abbess II. (A.K.R. 275) to champion Bonivard (A.K.R. 361), Feb. 16.

Morning Star—Gun. Chas. York's (Bangor, Me.) English setter bitch Morning Star (A.K.R. 1541) to his Gun (A.K.R. 1538), Feb. 23.

Black Pearl—Obo, Jr. G. W. Leavitt's (Boston, Mass.) cocker spaniel bitch Black Pearl (A.K.R. 647) to J. P. Willey's Obo, Jr. (A.K.R. 1481), Feb. 18.

Darkie—Obo, Jr. John Daly's (Salmon Falls, N. H.) cocker spaniel bitch Darkie (A.K.R. 250) to J. P. Willey's Obo, Jr. (A.K.R. 1481), Jan. 30.

Prep—Tom. John Kidston's (Chicago, Ill.) collie bitch Prep (A.K.R. 1574) to Peter Bradley's Tom, Feb. 21.

WHELPS.

☞ *See instructions at head of this column.*

Smut. H. C. Bronsdon's (Boston, Mass.) cocker spaniel bitch Smut (A.K.R. 868), Feb. 17, five (four dogs), by champion Obo II. (A.K.R. 432).

Zelpha. Henry C. Burdick's (Springfield, Mass.) Italian greyhound bitch Zelpha, Sept. 4, 1884, five (two dogs), by Silk Socks (Sport—Pearl).

Fanny. Thos. Goode Tucker's (South Gaston, N. C.) Byrou fox-hound bitch Fanny (Watchman—Nelly Hardy), Jan. 23, five, by Rouse (Racket—Trouble).

Onyx. John Clary & Son's (Westfield, Mass.) mastiff bitch Onyx (A.K.R. 1769), Feb. 2, twelve (five dogs), by their Keno (A.K.R. 1766).

Nettie. W. H. Cookson's fox-terrier bitch Nettie (A.K.R. 1704), Feb. 15, six (two dogs), by J. E. Thayer's Mixture (Spice—Fairy III.).

Pearl Blue. Charles York's (Bangor, Me.) English setter bitch Pearl Blue (A.K.R. 1542), Feb. 9, six (three dogs), by his Gun (A.K.R. 1538).

Nelly. Julius Fehr's (Hoboken, N. J.) black spaniel bitch Nelly, Jan. 1, five (three dogs), by Black Prince (A.K.R. 62); three black and two liver.

Ruby. The Kilmarnock Collie Kennels' (Boston, Mass.) imported collie bitch Ruby (champion Carlyle—Westmoreland Lassie), Feb. 7, nine (five dogs), by champion Rutland (champion Wolf—champion Madge).

Birdie II. J. W. Stairley's (Butte City, Mont.) English setter bitch Birdie II. (Sam—Birdie), Jan. 2, eight (two dogs), by Dr. B. Robinson's Duke; four since dead.

SALES.

☞ *See instructions at head of this column.*

Peek-a-Boo. Pug dog (A.K.R. 2038), by City View Kennels, New Haven, Conn., to Miss J. F. Breckenridge, same place.

Gun (A.K.R. 1538)—Pearl Blue (A.K.R. 1542) whelps. Black, white and tan English setters, whelped July 19, 1884, by Chas. York, Bangor, Me., a dog to Dr. S. E. Green, Newport, R. I., and a spayed bitch to E. A. Haynes, Glenbur, Me.

Jester. Maltese and white Italian greyhound dog, whelped Sept. 4, 1884 (Silk Socks—Zelpha), by Henry C. Burdick, Springfield, Mass., to Mrs. Chas. H. Colburn, Nashua, N. H.

Italic and Tottie. Italian greyhound bitches, whelped Sept. 4, 1884 (Silk Socks—Zelpha), by Henry C. Burdick, Springfield, Mass., to W. H. Cook, Saratoga Springs, N. Y.

Glen Elly. Lemon belton English setter bitch, whelped Nov. 22, 1884, by Glen Rock (A.K.R. 1616) out of Blue Belle (A.K.R. 99), by E. W. Jester, St. George's, Del., to Elly R. Watrous, Dayton, O.

Shaugraun. Red Irish setter dog (A.K.R. 640), by F. E. Draper, Lansingburg, N. Y., to Lee Chamberlin, Troy, N. Y.

Royal Sultan. English setter dog (A.K.R. 119), by Hugh Hill, New York, to Mr. Duryea, Brooklyn, N. Y.

Queen Bess. English setter bitch (A.K.R. 372), by Hugh Hill, New York, to Mr. Duryea, Brooklyn, N. Y.

Fleet O. Italian greyhound bitch, whelped July 19, 1884 (Snap—Pearl), by E. W. Jester, St. George's, Del., to C. W. DePauw, New Albany, Ind.

Dashing Dido. English setter bitch (A.K.R. 1537), by W. W. Davis, Philadelphia, Pa., to E. W. Jester, St. George's, Del.

Meg Merrilies. Red Irish setter bitch, whelped August, 1881, by Elcho (A.K.R. 295) out of Peg Woffington (Tippo—Ruby), by Dr. A. S. McLean, Springfield, Mass., to Harry A. Fletcher, Portland, Me.

Lady Ellen. Black, white and tan English setter bitch, whelped July 20, 1884 (Mike—Fanny), by G. H. Larry, Newburyport, Mass., to Geo. A. Rosa, Schenectady, N. Y.

Young Venom. Bull-terrier bitch, age not given (Prince—Venom), by F. Hinks, Birmingham, Eng., to E. Lever, Philadelphia, Pa.; she s in whelp to Dutch.

May Dale. Black and white English setter bitch, whelped Jan. 25 Dash III.—Nellie Dale), by Ravenswood Kennels, Boston, Mass., to Jas. T. Bruce, same place.

Duke—Birdie II. whelps. English setters, whelped Jan. 3, 1885, by J. W. Stairley, Butte City, Mont., a dog to Mrs. Julian Smith and a bitch to R. Isom, same place.

Rob Roy (A.K.R. 334)—Prep (A.K.R. 1574) whelp. Collie dog, whelped Nov. 1, 1884, by John Kidston, Chicago, Ill., to L. H. Clark, East Saginaw, Mich.

Barry. Imported rough-coated St. Bernard dog, 18mos. old, pedigree not received, by Rodney Benson, New York, to St. Bernard Kennels, Clifton, S. I., N. Y.

Jumbo. Mastiff dog, whelped July, 1884 (Turk—Countess), by Pine Hill Kennels, Melrose, Mass., to Gen. Wm. T. Withers, Lexington, Ky.

Viola. Mastiff bitch, whelped July, 1884 (Turk—Countess), by Pine Hill Kennels, Melrose, Mass., to Dr. J. N. Snyder, Montpelier, O.

PRESENTATIONS.

☞ *See instructions at head of this column.*

Crib. English setter dog, whelped March 20, 1884, color and pedigree not given, by N. J. McConnell, Butte City, Mont., to J. W. Stairley, same place.

Duke—Birdie II. whelp. Liver and white English setter dog, whelped Jan. 2, 1885, by J. W. Stairley, Butte City, Mont., to Dr. Benj. Robinson, same place.

Brigadier. Liver and white ticked pointer dog, whelped July 23, 1883 (Beaufort—Lillie), by N. Palmer, Baltimore, Md., to N. J. Rouse, Kinston, N. C.

DEATHS.

☞ *See instructions at head of this column.*

Belle's Pride. Blue belton English setter bitch, 5yrs. old (Paris—Belle), owned by Hugh Hill, New York, Feb. 18.

EVERY ONE interested in dogs should secure a copy of "Our Friend the Dog," a pamphlet on the care of dogs in health and sickness, with a list of canine diseases alphabetically arranged, and the symptoms and prescriptions for their cure. Mailed for 2-cent stamp. Associated Fanciers, 237 South Eighth street, Philadelphia, Pa.—*Adv.*

Rifle and Trap Shooting.

MISSING FIRE.

Editor Forest and Stream:

Under the above caption you print an explanation from the U. S. C. Co. The following is a passage from it: "The striker should be sufficiently long, and free to strike one-eighth of an inch beyond the face of the false breech, *so as to follow the cap and anvil to the bottom of the chamber of the cartridge, and so ignite it.*" The italics are supplied.

Let me modestly and with becoming diffidence suggest to manufacturers and to sportsmen, whether the seating of the anvil fairly down upon a solid support—the bottom of the chamber, in the case supposed—is not essential to the prevention of misfires? And is not the precise result warned against by the company, to wit, the "disturbing and shaking loose" of the percussion powder, absolutely insured by the method of explosion stated in the above extract?

The striker first makes "a deep, round indent in the percussion cap," says the company. But there is no explosion yet, remember, for the cap and anvil have not yet reached the bottom of the chamber, where they are "followed" by the striker. Until the bottom of the chamber be reached—and the anvil has a firm support there, as seems to be conceded—there can be no ignition. But this indent in the cap has, necessarily, "disturbed and shaken loose" the percussion powder, has it not, incapable in that condition of being ignited "by any number of blows," says the company. While actual results do not justify so extreme a conclusion, perhaps, have we not in such conditions, an explanation of such misfires as actually occur?

Now, a word of practical experience. The shells I use in my rifle come to me primed from the manufacturer. Assuring myself of the perfect construction of the gun in all the essentials of striker, lock and mainspring, I set about discovering the cause of at least one misfire in every ten shells.

Examining the cap, I find anvil crowded into it below a flush with the rim of the cap, and so that when the cap is crowded down into the chamber by the capper, the rim of the cap fetches up and rests upon the circumference of the concave bottom of the chamber, thus leaving between the anvil and the chamber bottom a space of, say one-sixteenth of an inch. Conceiving the remedy to be the seating of the anvil firmly down upon a solid support, I caused to be made a capper of such power as to force the cap so into the chamber that its rim, forced into the concave bottom of the chamber, is contracted or crimped around the anvil at its edges, and holds it firmly in its place, to receive the impact produced by the striker. With this method I have not had a single misfire.

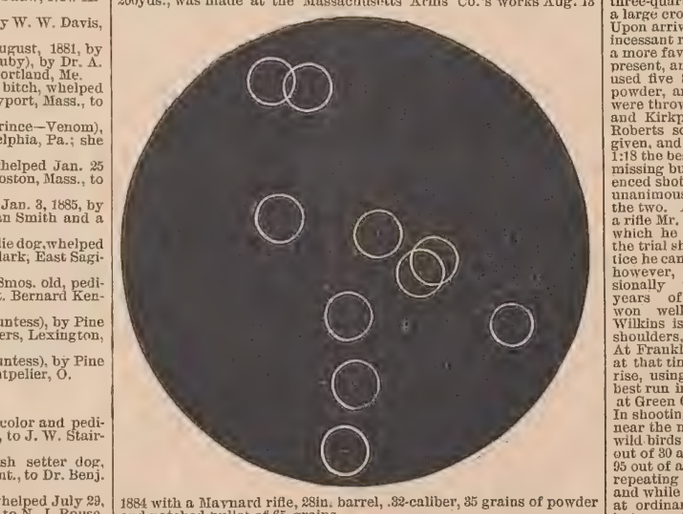
Would it not be an improved condition to have the anvil used in the cap so project above the rim that when the capper does its work the anvil will rest fairly down on the bottom of the chamber, and find there a solid support? FORBS.

FEBRUARY, 18, 1885.

MILITARY RIFLE SIGHTS.

Editor Forest and Stream:

The article on military rifle sights, by James Duane, in FOREST AND STREAM of Jan 29, I have read more times than any one article for a long time, and I heartily indorse all of his five conditions of backsight, except the second, viz.: to be so simple of construction that its use can be readily understood by men of ordinary intelligence, already familiar with the use of the Springfield or similar rear sight. [This would preclude the use of verniers.] The last clause is what I object to, why would it preclude the use of verniers? Is there anything so complicated or mysterious about a vernier that men of ordinary intelligence cannot grasp it, if so they would not understand elevating their crossbar or moving the wind gauge by the power of thumb, any better than by power of screw. It is placing the intelligence of our national guard or regular army at a pretty low degree to assume that they cannot fathom the mysteries of the vernier, especially when instructed by officers. If any reasonably good shooting is ever to be done at extreme distances, the rear sight will have to be adjusted with screws and the spirit level used also.



The third condition, "to be so easy of manipulation as to admit of rapid adjustment both of elevation and wind gauge," etc., is not so clear to my mind where the screw is used. The wind gauge would never get so far from zero but what a turn or two would bring it back, and in the case of sharpshooters firing at 1,000 to 1,200yds. and be attacked by skirmishers at 100 or 200yds. the vernier could be thrown down, bringing an open sight into view elevated for 150yds., the same as on the Springfield or Winchester .45-75, or Borchardt rifles, only the spirit level as it is on the Remington will have to be placed somewhere else.

With my old Remington sight, *i. e.*, the one before the vernier and spirit level came out, I made a little level and placed it squarely between the uprights, resting it on the top of the crossbar, it was out of the way, much plainer seen than their latest edition; the veriner would lie down in any position of the crossbar and the notch across the upper end of the uprights always be plainly in view. Now, if that sight had only screws to adjust with I would like it much better than their new one, which is very far from perfect, as far as the level is concerned, whose greatest objection is, I can't see the bubble plain and the sight can't be used at 200yds., till I have taken a screw driver and taken out the level. It seems to me all that is necessary to make their last sight perfection is to place the level squarely between the uprights on the top of the crossbar, where it can be seen much plainer; have it set high enough from the top of the crossbar to admit of a notch on the upper side of the bar and the peep hole below the notch, and so the uprights can be turned down even when elevated to the very top and bring into view instantly the open sight notch, at the upper end of the vernier. My mind is not perfectly clear about all the details of this sight, but I am satisfied I will work it out yet with my lead models, and have what to my mind is a perfect military sight. C. M. SKINNER.

MINNEAPOLIS, Feb. 14, 1885.

RANGE AND GALLERY.

CHICOPEE FALLS, Mass.—This target of 10 consecutive shots 200yds., was made at the Massachusetts Arms Co.'s works Aug. 13

1884 with a Maynard rifle, 28in. barrel, .32-caliber, 35 grains of powder and patched bullet of 65 grains.

WORCESTER, Mass., Feb. 10.—Members of the South End Gun Club were at their range to-day. The result of the number of balls broken is the totals of the handicap and score, strings of ten balls were thrown. The totals were as follows: H. W. Webber, handicap 8, score 2, broken 10; E. S. Poore, handicap 6, score 4, broken 10; W. R. Dion, handicap 5, score 3, broken 8; W. N. Hayes, handicap 6, score 1, broken 7; C. Doon, handicap 7, score 2, broken 9; V. D. Kennerson, handicap 7, score 2, broken 9.

Feb. 12.—Members of the Worcester Rifle Association went out to Pine Grove Range to-day. The Massachusetts target was used with a possible total of 120. The individual work of each man was as follows:

C Allen	9 11 11 11 9 12 10 11 10 11—105 10 9 11 10 11 11 10 10 12 9—103

NEW BEDFORD, Feb. 21.—A team of seven men of Company F, Third Regiment, came from Taunton to-day to have a friendly shoot with a team of the New Bedford City Guards, Company E. They shot two strings, one of ten shots and one of seven. Possible 350 and 245. The result was as follows:

New Bedford Team.			Taunton Team.	
Sgt A P Pope	37	29	Sgt B E Walcott	30	19
Sgt E F Dahill	36	28	Corp James Cornell	37	16
Sgt A T Howland	23	30	Priv W H Hewitt	36	27
Corp J E Barnum	38	23	Priv S J Fowler	20	24
Priv T H Bradley	38	25	Priv P H Booth	26	19
Priv E F Jennings	32	25	Priv J M Anderson	24	16
Priv E T Gibbs	35	20	Priv B H Lawton	16	15
	239	170		189	136

MILFORD, N. H., Feb. 23.—The following were the successful competitors for the prizes offered by C. W. Parsons, decimal target reduced, possible 400:

A B Earls	100	100	100	100—400	E D Huntley	99	99	99	99—396
J Seaton	100	100	100	100—400	J Hamerson	96	96	96	97—385

Ties on 400:

Earls	10	10	9	10	9—48	Seaton	10	10	8	10	9—47

Earls took gold badge, Seaton gold-lined cup, Huntley silver napkin ring, Hamerson pocket knife.

RICHMOND, Ind., Feb. 21.—The Richmond Rifle Team have their first big shoot Friday, Feb, 27, for a gold medal. Their range is not finished, but they are so anxious to get to work that they will shoot on that date. They expect to shoot for the championship of Indiana later in the season. Their range, when completed, will be the finest in the State. Their shooters are above the average and will soon be hard to defeat. A house will be built and the venerable item gatherer of the *Palladium* (Cal Johnson) will reside on the range and interest the boys with some of his by-gone exploits with the rifle.—C. A. J.

SPRINGFIELD, Mass.—The annual Washington's Birthday shoot of the Rod and Gun Rifle Club, at Lake Lookout, Saturday, was well attended and great interest was shown in the matches. The first, for the Washington's hatchet, a handsome trophy, presented by H. K. Cooley, was won by T. B. Wilson, over fifteen competitors with a score of 109 and a better record than W. M. Farrow and S. K. Hindley with like scores. The first place in the Merchants' prizes match was won by Z. C. Talbot over twenty-one competitors, by a score of 111.

WORCESTER, Mass., Feb. 12.—At the Pine Grove Rifle Range this afternoon, these scores were made, Massachusetts target:

C A Allen	9 11 11 11 9 12 10 11 10 11—105
M G Fuller	12 11 11 11 10 9 11 11 9 9—104
S Clark	11 11 8 11 12 9 10 12 9 10—102
A L Rice	12 10 9 11 8 10 10 9 10 10— 99

BULLSHEAD RIFLE CLUB, Feb. 13.—Twelve-ring target, possible 120; G. Zimmermann 116, V. Steinback 116, C. Rein 114, M. Dorrler 114, S. F. C. Weber 110, J. Schrarder 110, B. Wragge 107, J. Jordan 107, H. Gunther 107, J. Shaw 104, D. Louitzki 103, J. Wettje 97, D. Holland 96, H. Lindlinger 96, H. Wasmuth 95, H. Miller 91, H. Heiser 90.—A. LOBER, Sec'y.

BOSTON, Feb. 21.—It was a beautiful day for rifle shooting and a large number of gentlemen took advantage of it at Walnut Hill today. The wind was not very troublesome, blowing from 11 o'clock all day. A team match was shot by teams of six men, and resulted in a victory for the team captained by Mr. Cushing by a score of 376 to 349. Following are the scores:

Creedmoor Practice Match.

H Withington	5 4 4 4 4 5 5 4 4 4—42
A J Teal	3 8 5 3 4 3 4 5 5 4—41
D P Dodge	4 4 3 4 4 4 4 3 5 5—40
W H Oler	4 4 5 4 5 3 3 3 4 4—40

Creedmoor Prize Match.

W Gardner	4 4 4 5 5 4 5 5 5 5—46
H Cushing	4 5 5 4 5 5 4 5 5 4—46
J B Fellows	4 5 5 4 5 5 5 5 4 4—46
H C Norton	5 4 4 5 5 5 5 4 5 4—46

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

RAPID SHOOTING.—Meadville, Pa., Feb. 9.—The announcement made that Mr. Otto C. Wilkins, Meadville's phenomenal rifle shot, would on Wednesday, Feb. 4, attempt a trial shoot at 100 glass balls against the best time on record, being that of Dr. Carver, three and three-quarter minutes, notwithstanding the inclement weather, drew a large crowd of spectators to the Crawford County Fair Grounds. Upon arriving at the grounds, many of his friends, on account of the incessant rain, tried to prevail upon him to postpone the trial until a more favoraole day; but Mr. Wilkins rather than disappoint those present, and with his usual pluck determined to make the trial. He used five Spencer repeating shotguns, loaded with 2¾ drams of powder, and ⅞ of an ounce of No. 9 shot, distance 30ft. The balls were thrown into the air by Mr. John Raesch, Messrs. Trowbridge and Kirkpatrick loaded the guns, Messrs. Harry Jones and Frank Roberts scorers, and W. H. Keifer official timer. The word was given, and in 2:27 the scorers called the 100th ball broken, which is by 1:18 the best time ever made. During this time he shot at 116 balls, missing but 16. His shooting is perfectly wonderful. Many experienced shots that were present, and have also witnessed Carver, were unanimous in saying that Mr. Wilkins is quicker and the finer shot of the two. At various times, for the amusement of his friends, with a rifle Mr. Wilkins will shoot pennies, chestnuts, leadpencils and dice, which he seldom misses. During the first twenty-six seconds of the trial shoot he broke 26 balls, and feels confident that with practice he can break a hundred balls inside of two minutes. His forte, however, is with the rifle, and he only shoots occasionally with the shotgun. He began shooting when nine years of age, and since he was sixteen years old has won well-contested matches against men much his seniors. Wilkins is 25 years of age, 5ft. 9½in. high, light built with broad shoulders, straight as an arrow and very graceful in his movement. At Franklin, Pa., May 4, 1880, Wilkins beat the best score on record at that time with a rifle at glass balls out of a Bogardus trap, 6yds. rise, using a .44 Kenedy magazine rifle, and broke 476 out of 500, his best run in this match was 107 straight. In 1879 at an exhibition shoot at Green Castle, Pa., he broke 985 out of 1,000 and made a run of 272. In shooting he extends his left arm straight out, grasping the barrel near the muzzle and shoots with both eyes open. Shooting at live wild birds from a ground trap 21, 26 and 31yds., rise he has killed 29 out of 30 and 39 out of 40. His average at clay-pigeons, 18yds. rise is 95 out of a possible 100. Mr. Wilkins is enthusiastic over the Spencer repeating shotgun. Mr. Wilkins is extremely modest in his manner, and while he does not as yet claim to be equal to Carver or Bogardus at ordinary shooting, hopes with practice to attain that point, but on quick shooting at 100 balls, he justly claims the championship of the world and is ever ready to defend the same, but is now desirous of making go as-you-please matches.—A. H. KEIFER.

VON LENGERKE VS. BARHYTE.—A great crowd of friendly spectators met on Monday last at the grounds of the gun club at Short Hills, N. J., to witness the match for $500 between Justus von Lengerke, of Hoboken, and Peter Barhyte, Fishkill Landing. The match was for $250 a side, guns to be under 7½lbs. in weight; 30yds. rise, both barrels, at 50 birds each, 5 traps. The guns to be held below the elbow and birds to be shot with the second barrel only when on the wing. Mr. R. Heber Breintnall was elected referee, and Mr. Chas. DeRonge judge for Lengerke and W. Bent for Barhyte. The birds were the pick of a very fine lot. There was little or no wind, but the light was very dazzling, owing to the heavy fall of snow on the ground. Von Lengerke won the toss and on the fortieth round Barhyte was shot out, thereby losing the match, as the appended scores will show:

J von Lengerke	10111111010111101111101111111111111111—35
P Barhyte	00110111111100100100101100101011111000—22

Prior to the match a sweepstake of $5 entry, at 5 birds was shot, there being 22 subscribers. The first money was divided between Stewart, Holcomb, Ziegler and Lever; the second between Castle and Heritage, Jr., and the third between Hughes and Van Schaick.

NEW JERSEY.—The members of the Carteret Gun Club participated in their annual Washington's Birthday shoot at Bergen Point, N. J., on the 23d. There were eleven competitors, as follows:

Milner, 27yds	9	James, 27yds	5
Murray, 26yds	8	Hunter, 26yds	4
Lee, 27yps	8	Robinson, 26yds	4
Taylor, 27yds	8	Campbell, 25yds	2
Kent, 27yds	7	Stone, 26yds	1
Duane, 26yds	5		

Ties for second: Taylor 7, Lee 6, Murray 3.

The Newark Gun Club celebrated the holiday with a clay-pigeon and glass ball shoot, on their grounds on South Broad street.

WELLINGTON, Mass., Feb. 21.—The following events took place at the range of the Malden Gun Club to-day: 1. Five blackbirds—Parkhurst first. 2. Five clay-pigeons—Loring, Kimball and Sanborn divided first. 3. Five clay-pigeons—Loring and Parkhurst divided first. 4. Five blackbirds—Shumway first. 5. Three pair blackbirds—Nye and Scott divided first. 6. Ten blackbirds—Parkhurst first. 7. Five blackbirds—Nye and Shumway divided first. 8. Five blackbirds—Loring and Sanborn divided first. 9. Three pair blackbirds—Kimball first. 10. Five blackbirds, straightaway—Adams and Sanborn divided first. 11. Ten clay-pigeons—Loring first.

KNOXVILLE, Tenn.—Regular monthly shoot of the Knoxville Gun Club, Feb. 17:

Hebbard	0000000101101111— 6	Mead	1100010001011110— 7
Ross	1000010111111111—10	Worsham	0010111010100001— 6

Eldridge	1100100010101011— 7	Armstrong	0100111011111101—10

NEW ORLEANS, Feb. 11.—The second international clay-pigeon tournament opened with bitter cold weather to-day. The crowd was large and the shooting incessant. The result of the day's matches were: No. 1. C. R. Dickey, of Boston, and B. Tiefel, of Cincinnati, divided first. No. 2. B. Tiefel won first. No. 3. H. Bandle, of Cincinnati, first. No. 4. A. Cardona, Jr., first. There were many sweepstakes besides the main matches.

Feb. 12.—A heavy rain compelled the suspension of the regular matches, but there was an abundance of sweepstake shooting. Dickey, of Boston, and Capt. Stubbs had a special match at 25 birds, the former breaking 23 and the latter 16.

Feb. 13.—Exciting sport was the order to-day. In the international team championship match, Boston Gun Club No. 1, took first place with a score of 40 in the possible 60. No. 6. Sweepstakes, Linnemann, of Bradford, Pa., dividing first with Eager and Virgis. No. 8. Miss and out sweep, first divided by Watkins, of Nashville, and Penrose.

Feb. 14.—Shooting still on and challenges by the score floating about. No. 13. Team match, Cincinnati Gun Club first, 48 birds in 50. No. 14. Five singles, Downey first. No. 9. Interstate twin team match, Eager and Stark, Boston Club, first. No. 16. Five singles, Dickey first, full score.

In the FOREST AND STREAM of the 5th prox., a full and accurate official score of the tournament will be given, also the outcome, if such a thing is possible, of the many challenges for the championship which have been the outcome of the tournament.

One of the most important prizes offered for the Ligowsky Clay-Pigeon Tournament at New Orleans, is a handsome gold medal presented by the Merino Elastic Felt Wad Company of Baltimore. It is of 15 carat gold and weighs 17 pennyweight. Upon its face it bears a view of a shooting match, representing a sportsman in the act of firing, while kneeling behind him is an attendant who has just pulled the trigger of the trap. Seated to the left is the scorer with his open book before him. Upon the reverse side the words: "Presented by the Baltimore Merino Elastic Felt Gun Wad Company," running nearly around the edge of the medal, and in the center the words "To," with a space for the name of the winner, "at the Ligowsky Clay-Pigeon Tournament, New Orleans, 1885." Above the medal are two guns crossed, surmounted with a plain bar, with the letters "M. E. F. G. W. C."

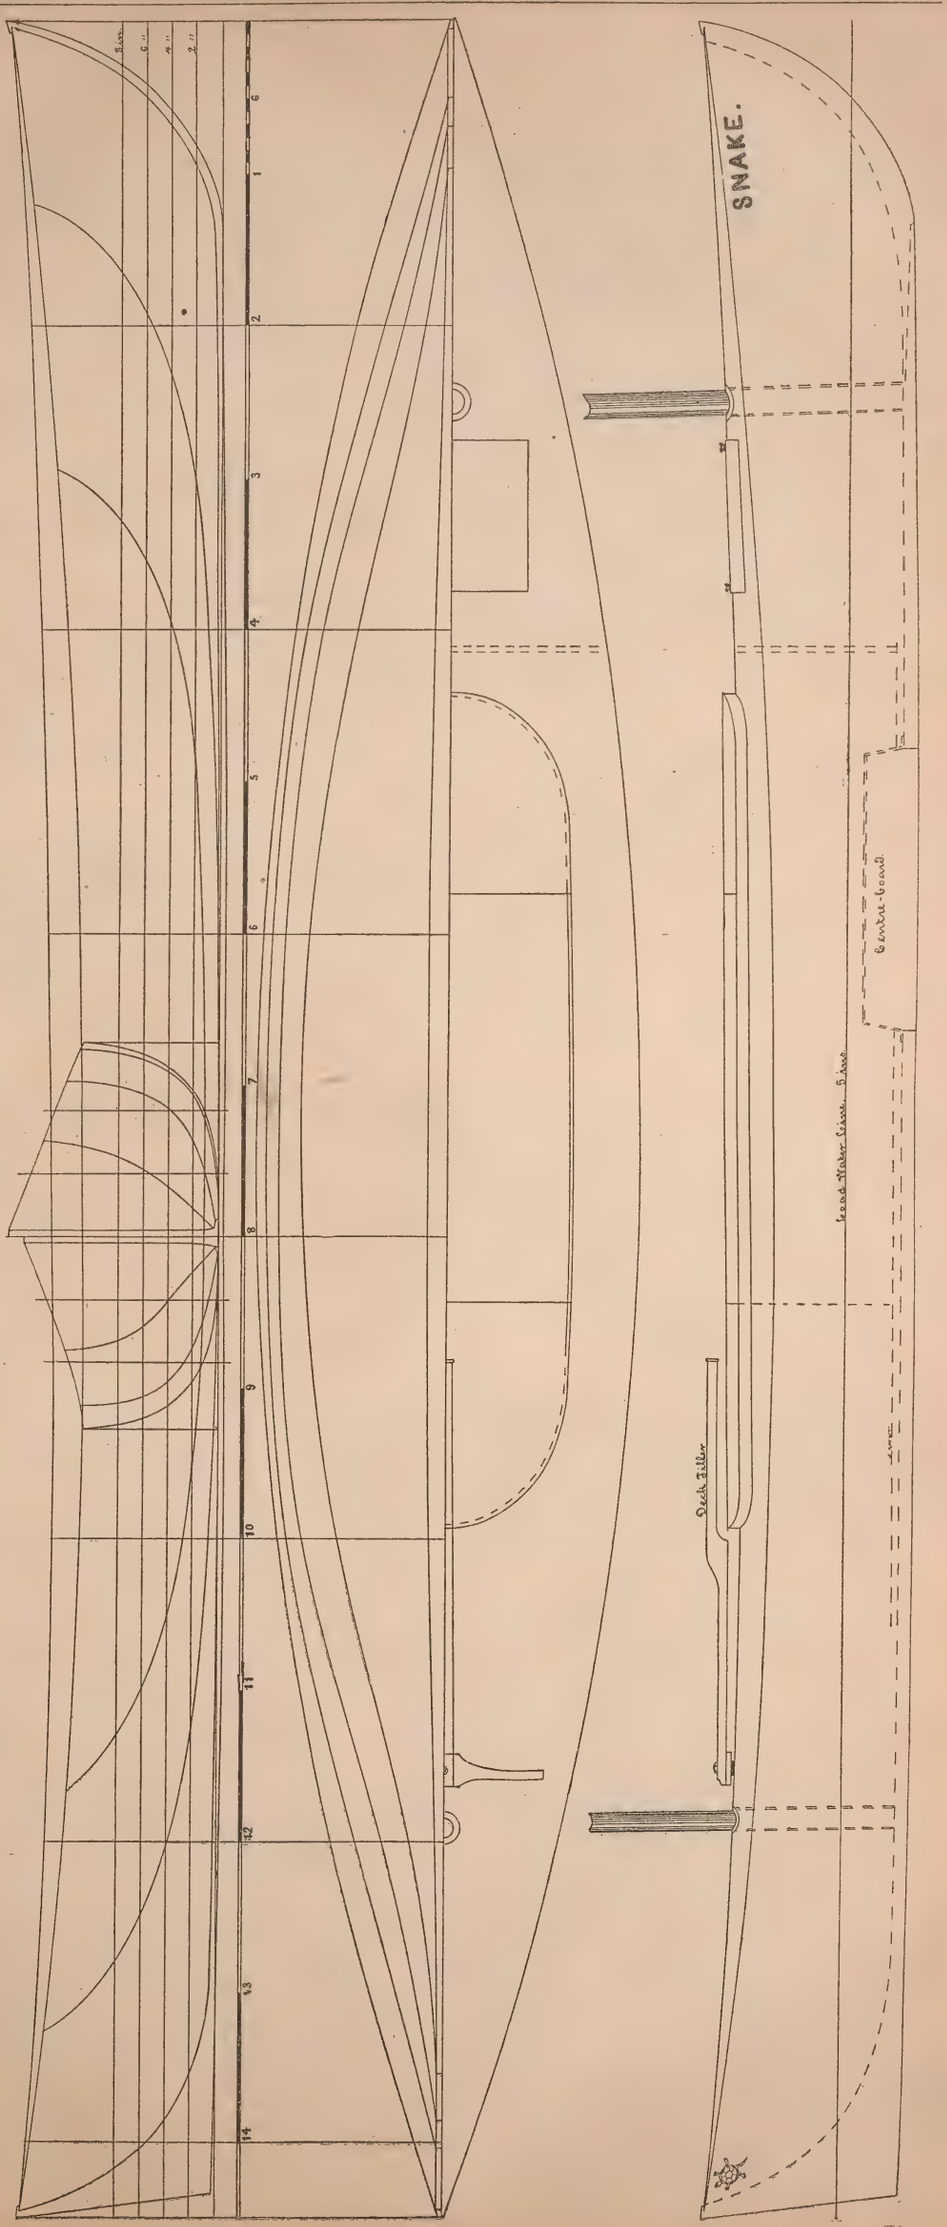
ITHACA, N. Y., Feb. 19, 1885.—A match at glass balls took place here to-day between a team from the Lakeside Gun Club of Geneva, N. Y., and one from this place. Conditions, 25 balls per man, 18yds. rise, Card's revolving trap, the losing side to pay for the balls. The following is the score:

Ithaca Team.		Lakeside Team.	
H White	23	D W Parshall	20
J H McCormick	21	J G Stacey	23
A White	24	J Dixon	23
D Norton	23—91	H B Whitney	25—91

The tie was shot off at 21yds. rise: Ithaca Team—H. White 5, McCormick 2, A. White 4, Norton 5—total 17. Lakeside Team—Parshall 5, Stacey 5, Dixon 4, Whitney 4—total 18. This result gave the victory to the Lakeside Gun Club by one ball. A closer contest with such excellent shooting has seldom taken place, and never was a visiting team better entertained than the Lakeside Gun Club team was by their opponents—S.

BOGARDUS VS. CARVER.—The match shoot between Capt. Bogardus and Dr. Carver—200 double bats, Louisiana Gun Club rules, and 300 singles, go-as-you-please, against time—was begun on the 22d, but the lateness of the hour prevented its completion. One hundred doubles were shot, resulting in favor of Dr. Carver, who killed 106 to Capt. Bogardus's 102. The match was concluded on the 24th with the shooting of the singles.

CLEVELAND.—A match between the Kirtland Shooting Club and the Cleveland Gun Club has been arranged, and will be shot in a short time. Both teams are busy at practice.



Canoeing.

FIXTURES.

March 3—K. C. C. Camp-fire, 106 West Forty-second street, 8 P. M.
March 17—K. C. C. Camp-fire, 106 West Forty-second street, 8 P. M.
March 31—K. C. C. Camp-fire, 106 West Forty-second street, 8 P. M.
May 30, 31—Hudson River Meet.
July ——Western Meet, Ballast Island, Lake Erie.
July 24 to Aug. 8—A. C. A. Meet, Grindstone Island.

THE SNAKE.

THOSE who have seen the Snake at the last two meets, or who have read her history in the FOREST AND STREAM of Jan. 22, will study with interest the lines here given of the well-known craft. Her dimensions are, length 14ft. 6in., beam 30½in., depth amidships 10½in., at bow 18in., stern 16½in. She has always carried an Atwood board, and for some time past has been fitted with a drop rudder. Her sail plan will appear next week.

PADDLES AND OUTFIT.

Editor Forest and Stream:

I have been reading an account of "Sis" in the FOREST AND STREAM. He speaks of crossing Ipswich Bay in his canoe in pretty rough weather, the bow man using a double paddle and the stern man a single one.

Now, I am an ardent canoeist, and want to get all the points I can. "I am only two seasons old with the paddle," and I would like to know the kind of canoe "Sis" uses.

I have a birch bark 15×36, and it is rather hard to use a double paddle in her. That is, one man double and one single. What I would like to read in some accounts of cruises, would be a description of the canoe used and also some of the outfit. Ours as yet consists of one kettle, two tincups, knife, fork and some pitch for patches, so you see we get along with very little, but hope to improve a great deal the coming season.

Can you tell me where I can get some birch gum or something that will stop a leak in a birch canoe. YLMOC.

PHILADELPHIA.

[Several receipts for stopping leaks in birch bark canoes were given in the FOREST AND STREAM of May 8, 15, 22 and 29, 1884. We have published at various times descriptions of canoe outfits; but they are improving all the time, and canoeists who have anything new are requested to send a description of it for the benefit of all.]

"CANOE AND BOAT BUILDING FOR AMATEURS."—Mr. Stephens is far too modest in giving a title to his book. It is, indeed, a manual of canoe and boat building for amateurs, since it describes the process so clearly that any person with a little experience in handling tools could build a satisfactory canoe by following Mr. Stephens's instructions. It is, however, a good deal more than this, since it is the most complete and exhaustive treatise on the rigging, fitting and handling of canoes that has yet appeared. Precisely such a book has been longed for by every canoeist, and its appearance will be gladly welcomed. It covers a field which no other book has attempted to cover, and contains the very latest results arrived at by the best builders, riggers and sailers of canoes. The author is not only a practical canoeist, but he is a thoroughly trained boat builder, and to the enterprise and enthusiasm of the amateur he adds the technical knowledge of a professional expert.—*New York Times, Feb. 15.*

ANOTHER CANOE CLUB.—*Editor Forest and Stream:* Dubuque is to have a canoe club this summer, the boys are taking quite an interest in the subject and I think part the credit is due the FOREST AND STREAM. Dr. Guilbert (Camarada) should be here to take part and help the club along.—W. P. COUCH. [This year, 1885, promises to be for the West, what 1880 was for Eastern canoeists, the date of their organization and first meet. We hope the canoeists of Dubuque will organize at once and take hold in time to have a big representation at Ballast Island.]

PERSONAL.—Mr. S. D. Smith is now cruising about Bermuda in a light-wight open canoe. Hiawatha and her owner, Mr. Seavey, leave for Florida this week and will join Psyche on a cruise. The Hiawatha has been fitted with a rudder and larger sail, and her crew will swing a ten-foot double in place of a single blade. "Nessmuk" is enjoying himself in the company of Captain Kendall (the "Barnacle" of Dr. Neidé's new book). Mrs. Kendall has become quite expert in paddling the little Bucktail.

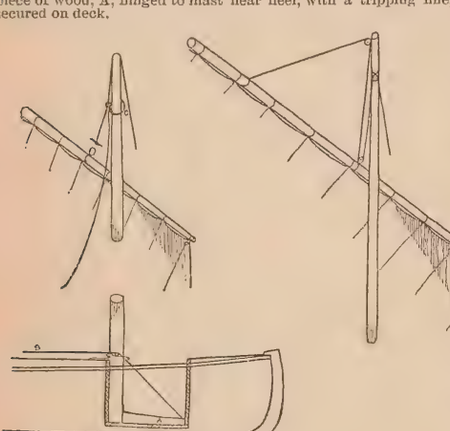
THE ASSOCIATION BOOK.—Dr. Neidé is now busy with the "A. C. A. Book" for 1885, and members will please send him notice of changes in address or in names of boats. Those who are in arrears with their dues are also requested to forward them as soon as possible, in order that their names may appear in the list.

KNICKERBOCKER C. C. CAMP-FIRE.—The K. C. C. held their second camp-fire on Feb. 17, at 106 West Forty-third street. Prof. Fowler read a carefully prepared paper on canoe models. The next meeting will be on March 3.

SAN FRANCISCO.—The Oakland canoeists were to cruise to Sancelito and Racoon straits on Washington's Birthday. Several of the Alaska skin canoes are in use about San Francisco.

CANOE YAWLS AND CRUISING.

IN the FOREST AND STREAM of Nov. 4, 1884, appeared the lines of a little canoe yawl, the Cassy, designed and used by Mr. Geo. F. Holmes, of Hull, England, and the following extracts from a letter of Mr. Holmes, give some further particulars of the boat and her rig:



I can, after another season's experience of the boat, thoroughly indorse all I have said in her favor. In company with another boat of similar build I had a very successful cruise last summer. I first brought my boat by rully and by train to Hull, the expense and trouble in transit being hardly any more than for a Rob Roy canoe. In Hull both our boats were put on board steamer and conveyed to Port Yarmouth, where we got them into the water and loaded stores. As we lived on board, cooking, etc., in the boats, our stores were necessarily somewhat numerous. The broads and rivers of that district being pretty well sheltered, we each had our racing sails, and to economize space in the boat, used lead ballast under floor boards. The boats row easily, in fact, I would rather row my boat with her 3ft. 4in. beam, than paddle a Mersey canoe 2ft. 3in. broad.

"The two boats being very equal in sailing qualities, our cruise was a perpetual regatta on a small scale. The Cassy proved herself the faster boat to windward, especially in very narrow waters and strong breezes, while the Alice, with nearly fifty per cent. more ballast, rise of floor (and straighter keel) and one inch more draft, ran faster especially in light breezes, and would squeeze round a point better. The Cassy rows also considerably more lightly. We both used tents of undressed material of the *d'aori* kind and simple construction.

"On a former cruise (1882) in Denmark with a smaller canoe yawl (no centerplate), the same friend accompanying me in a 12ft. R. C. C. first class canoe, we used a shore tent, but I am bound to say that for comfort, both in sleeping and cooking, the shore tent isn't a patch on the boat tent.

"My usual cruising ground is the open sea off a sandy beach and I have to launch through the surf, which is sometimes rather heavy. With an oilskin coat on one can generally get out pretty dry, as the well is small and in case of a breaker coming on board the long fore deck is a great advantage. The boat is quite steady enough for one to stand on the deck even when the water is not quite smooth. The boat alone weighs 224 pounds, centerplate 70 pounds (lead ballast only used for racing rig, 90 pounds). With my wheels I can launch the boat alone at low water (200 yards) but I don't do so if I can help it as you may suppose. The boat's worst fault is her tendency to yaw when running in troubled water. She is, however, so delightfully easy on her helm when close-hauled, and so quick in stays for narrow waters that I am willing to part with a little steadiness. In addition to the Mersey kind of a yoke (for steering) which I now connect with a hollow brass rod with ends screwed in. I often use the boathook as a Norwegian tiller, which is handy, especially when there are two in the boat, as either can then steer. A sculling crutch on the quarter is often useful.

"To remove strain from forestay when racing mast is in use, I used a piece of wood, A, hinged to mast near heel, with a tripping line, B, secured on deck.

"The best form of connection of lug yard to mast is shown here. A double halliard sets the large lug sail well. I used it on my canoe this year and was fairly satisfied with it. A downhaul is necessary. I have used your uphaul for centerboard and found it work very well.

"I am glad to hear of canoeing prospering so well in your country, it seems to be in rather a poor condition in some parts of England. Our little club is threatened with dissolution in consequence of the boat house on the Humber side being required for shipbuilding purposes, and only last summer two races fell through in consequence of the apathy of the members. GEO. F. HOLMES."

HULL, England.

Yachting.

THE FIRST CUTTER ON LAKE MICHIGAN.

ST. IGNACE, July 2, 1883.—Everything was put aboard the Iolanthe by 4 P. M. of a beautiful July day in '83, and at 5 a sailor whom I had engaged to pilot me out of the Straits of Mackinac reported for duty. After eating our supper in the forecastle, in which our little oil stove did its duty by making us a warm cup of tea, we cleaned up everything and prepared the Iolanthe for her maiden race with a 24-foot sloop and a number of Mackinac boats which were waiting about, anxious to show the inhabitants how easily they could get away with the "cutter." The builder of my boat assured me of success, but the well-known reputation of the Mackinac boats made me somewhat incredulous as to our ability to beat them. It was my first experience aboard a cutter with metal outside, having always sailed a genuine skimming dish.

We weighed our anchor and were soon under way with all lower sail set. The Iolanthe is 28ft. over all, 22½ft. waterline, 7ft. beam, and 4ft. 6in. draft. This part of the Straits of Mackinac is about eight miles wide, and the beautiful Mackinac Isle about five miles south. We headed for the Isle. Rigging and sails being new and untried were very troublesome. Ronald, the builder, had the tiller, and having built and sailed a boat of the same dimensions in Scotland, knew how to get the best out of her. The wind being on our starboard quarter, we held the main sheet well in, to practice a little deception on the boys, and as they began to draw away from us their spirits rose with the freshening breeze, and the "heavy-ballasted, too-much draft" cutter was fast lowering in their esteem. We let them get a good start, and as they drew away they kindly offered to tow us, and exhibited rope for that purpose, though we were ungenerous enough to refuse their kindness. After they thought they had it all their own way we quietly paid out the mainsheet and began to draw on them. It was amusing to see their confusion, but we couldn't help it. And when we got down to real sailing in the lively thrash to windward, they were the most disgusted, unwilling converts one can well imagine. Suffice to say, when they got back we were smoking our "prime Durham in a brier bowl," with sails furled ready for congratulations which, strange to say, we didn't get.

An early start being contemplated in the morning, we turned in at 8 P. M., and tucked ourselves away on the "just too comfortable for anything" berths in the cosy cabin, and were soon vieing with each other in the art of snoring. The faint light of early dawn was but just piercing the dense fog when I stuck my head out of the cabin. The water like a millpond, not a breath of air, a sixty-mile outside run before us, and no good anchorage till the end was reached, flashed through my sleepy head. But Louis awoke, we washed in the cold, reviving water peculiar to this region, and downing a hasty lunch stretched our mainsail to just a breath of air, hoisted the anchor, and with jib set moved slowly away, as though Iolanthe was loath to go abroad from the land of her birth.

But slowly we moved out until away from the land, the fog disolving before the united action of wind and sun. We caught the breeze from Lake Huron and soon were driving along under a fine topsail breeze to grand old Lake Michigan. At 9:30 A.M. sighted Wagushance Lighthouse, and at 11:30 were abreast of it. The wind now shifted to the S. W., and necessitated beating. A short, choppy sea soon followed the freshening breeze, and it did my heart good to see the yacht go through it. Not a drop came aboard except the wind-blown spray from her clipper bow.

At 3 P. M. we were off Little Traverse Bay. The wind had been constantly and so steadily increasing that we hardly noticed it until an unusual line of combers in the distance warned us of much greater wind. We hove to, and having lowered the jib and foresail, attempted to reef the mainsail, when we found the unwieldy proportion of 10ft. of boom over the stern. No foot line or proper reefing tackle, and no time to rig one. So we had to down the sail, which was hardly done ere the gale was upon us. Setting the foresail we stood on for a time, going to windward in a gale under foresail only. Where would our shallow draft have been there? The gale kept increasing in fury, and as the harbor for which we were bound (Charlevoix) was not very safe to enter in a gale, we put about and made for Harbor Point.

Oh, ye deluded flatboatmen! had your hand been upon the tiller when she was heading up to those big combers, and felt the ease with which she cushioned into the sea, imparting no vibration to the yacht, throwing the sparkling waters to the right and left, keeping her deck as dry as a parlor floor, and felt how stately she seemed to stand up to the tempest of wind; having a decided will of her own, and that to mind the dictates of that deep and narrow rudder, unmindful of the vicious temptings of the sea to throw herself into the trough of the waves, you would think as I do, there is but one yacht and that a cutter.

The fifteen or more miles to Harbor Point were soon covered, and we glided from the turbulent and angry waters into the finest harbor on Lake Michigan, whose wonderfully clear and sparkling waters, completely land-locked on three sides, afford shelter to many a storm-beaten craft. We dropped the anchor in three fathoms, and after putting everything in shape and changing our rain-drenched clothing for warm, dry, shore clothes, we launched the punt and went ashore.

Harbor Springs (more commonly known as Little Traverse), is situated just behind the point, and boasts of a fine hotel for the accommodation of summer visitors who teem by the hundreds this season of the year in this health-giving location. To the hotel we steered, and being the first to supper and the last to leave, I rather think they took us for well dressed tramps. On returning to the yacht we noticed a little black schooner which had run in out of the storm anchored near us. It proved on closer inspection to be Little Frank, a description of which might interest some aspirant to single-hand yachting on a large scale: Little Frank (so named because of his very diminutive size) is known all over the lake as a little Portuguese sailor, who for about twenty years has sailed singly and alone a 55ft. schooner which carries topsails. He makes long runs without making port, and how he manages in a storm is a mystery to every one but himself.

Feeling very sleepy we turned in at 9 P. M.

The early boom of cannon next morning announced the glorious Fourth of July, which to us was very uneventful, as we were all day making the twenty miles to our destination; our only celebration being made by frequent blasts on the fog horn because of the dense fog existing. The last straggling firecracker had about had its say when Iolanthe was ushered into the beautiful harbor of Charlevoix, where for a time, at least, she was at home.

In conclusion, permit me to add my feeble testimony to the comfort and peace of mind and thorough contentment which comes from a clear conscience in having a yacht in which you at all times feel safe, and on which dependence is placed in times of emergency to the utter exclusion of fear. And, further, the cutter is the boat for the great lakes without a doubt. For the violent, choppy sea which an ordinarily heavy wind invites, on such short notice, too, is best guarded against by the deep and heavy keel yacht. And as for the rig, from my experience with the double head sail its extreme handiness in all weathers and thoroughly shipshape appearance commends itself to me above any others. G. H. WINANS.

KALAMAZOO, Feb. 10, 1885.

"BLOW YE WINDS HEIGH O!"

THIS is the title of a most welcome little volume which has just made its appearance. It is welcome because obviously from the pen of an adept who is more than a mere chronicler of passing events. From first to last the author gives evidence of his own live interest in yachting affairs which he views and interprets from the standpoint of a thorough sailorman in wholesome sympathy with the manly and ennobling side of the sport. To him a rough and tumble bout to windward in a wild looking sky, with the sea running furious and the vessel plunging in up to the bits, is not so much a fright-inspiring task to be shirked, as a job to be undertaken as a contest with nature in dead earnest with a view to winning reward in the satisfaction derived from success in the issue and the scope afforded to personal prowess. Moreover, the yarn retails the actual doings of a famous ten-ton racer, aboard of which we are induced to feel perfectly at home, thanks to the author's own familiarity with the vessel and his naive way of interweaving many a pointed little passage hinging upon the domestic economy and the social surroundings of jovial companionship in the snug cabin of the bright little flyer.

To Americans this book is more than welcome. It is highly instructive. For its spirited pages and handsome illustrations reflect the all-round experiences of life aboard a representative English racing cutter of such small tonnage and cost, coupled with the utmost return possible in the way of intense yachting life that the near future should see many like vessels in our own waters. The book offers pages of evidence of the tremendous gulf which still exists between the childish methods of following the sport in small boats on this side of the Atlantic, and the incomparably superior attack of the bold, dashing, advanced ideas enterprise, the robust bodily and mental vigor of the British style of buccaneering the high seas in a way which puts to shame the nursery toys to which we still cling in ignorance, and our puny counterfeit efforts at yachting, the merest fringe about the real article. And when we read how the gallant little Nereid, Lilly, and a whole bunch of similar vessels got embayed in Bangor Roads, and how they successfully cleared out of a touch and go scrape, then we can appreciate at one bound how superlative the qualities of British yachts must be to accomplish what one of our centerboards could no more do than fly to the moon. Read this passage and let each answer for himself what would have become of our light draft traps in a like situation. Fancy a centerboard with that lubberly execration, a "bobbed" jib tied down to bowsprit end, suddenly slipping, paying broad off down on the reef before gathering way, and then at the critical instant, fancy putting round the light-weight trap against the steep sea piling in! Our sloops, indeed! They would have cut the usual contemptible figure the moment downright work and worth is demanded, for they are but the froth of the shipbuilder's art, and far from being the substance. Let me quote the book:

"As the anchor touched the ground we were hailed by a friend on board the Sunshine, but could not make out what he said, though we wondered much the reason which kept our friend out of his warm berth at this hour of the morning, and also the cause of the animation visible on board the several other yachts in our neighborhood, each having a few hands on deck. But tired after our passage, we were too fagged to trouble ourselves much, and having helped the crew, who had been roused up to stow canvas, we sought our well-deserved rest, heedless of the threatening look of the dawn and the heavy swell which was rolling right into our anchorage, which, as we learnt afterwards, was the cause of the wakeful state on board our brethren. The fact was, having but just come out of a heavy sea, the comparative change was so great as to lull us into fancied security. Meanwhile, the Lily had ranged alongside and also let go about twenty yards inshore of us, and hailing them a good night, we went below. Any of my readers who were riding in Bangor Bay that eventful night will not easily forget the squandering which took place at break of day. We had slept our hardest for but an hour, when the ever-watchful skipper, who had kept on the alert, aroused us at five o'clock with the information that we had best get out of the bay as soon as possible, and on slipping our things and coming on deck, we found the need of an immediate flight only too necessary, for oh! such confusion met our half-awakened gaze!

"The wind had piped up to the strength of a gale, which blew straight in from the open sea. We were diving bows under to the butt's end, shoveling masses of solid water along the decks until everything was awash. Around us the fleet were in various stages of confused endeavors to spread canvas and get underway, while two or three lucky ones were already disappearing under just a shred of canvas around the point, for the shelter of Carrickfergus. On board our neighbors the anxious-looking crews were in a state of excited animation and struggling with spars and sails which had broken adrift, the sea continually drenching over them. On board Britannia on our quarter, and nearer the shore, a solitary figure was clinging with terror-stricken face to the mast, and the yacht had already dragged so near the breakers that we expected every moment to see her go ashore. We could not get underway ourselves on either tack, as we had the Lily to starboard and a cruising yawl to port, which barred our passage, so we were compelled to look on until one or the other had cleared out, which the former was preparing to do with all speed. . . . Meanwhile it was with the greatest difficulty we were able to get the storm jib on the outhaul [Imagine a sloop bobbing her jib at bowsprit end.—C. P. K.] as it took us all we knew occasionally to hold on and prevent ourselves being washed overboard. But at last we managed this and to get the trysail close reefed and ready for hoisting. . . . The Lily was now on the point of making a start, and we watched her anxiously as she filled away for a short board toward the rocks, which were but twenty or thirty yards under her lee. No centerboard would have dared a like task. She would have driven bodily down upon the danger before gathering enough way to come about with certainty in such a sea.—C. P. K.] When as close as she about with certainty in such a sea.—C. P. K.] When as close as she could venture, her helm was put down and with just enough way to bring her round she came up to the wind, when at a critical moment a sea struck her and threw her off again toward the rocks, and we thought for a moment she was gone; but recovering from the shock she came up again, and shaking for a moment in the wind, gradually paid off again and filled on the other tack, and after a narrow squeak hung up to windward out of danger; another board and she was making good way, and at last weathered the point and was away after the others for the shelter of Carrickfergus. [Now how much would a little centerboard sloop recover and come up again after being cuffed off by a sea with scarce way enough in the first place to come round at all?—C. P. K.]

"It was our turn now, and, careful of every inch of water, we sailed her well up to the spring which we had attached to the cable, intending to slip it, let go, and hold on a few yards toward the rocks over the same course as Lily had taken. [How much way would a light sloop have on, with only a few yards' sea room, after having paid way off on her center before coming unter control of the wheel at all?—C. P. K.]

"When within a few yards of the breakers, with just enough way to bring us well round, we put the helm down, and with our hearts in our mouths waited to see the good little ship shoot up into the wind for the pinch; but there was doubt only for a moment longer, and we fell away on the other tack and were safe, as we could weather the yawl easily, and the way the Nereid then clawed out to windward through the heavy seas was truly a marvel." [How much would a sloop be likely to claw with bobbed jib tied down beyond any one's control, and say the peak of mainsail? I rather think she would have clawed like a crab, sideways and ashore.—C. P. K.]

"Two or three short boards enabled us to weather the point, and with the water drenching over us in smothering showers we reached away after Lily. Another hour found us riding in welcome shelter at last, and after a good breakfast we felt none the worse for our hardship." [It should be remembered that Nereid was about 36ft. loadline, and Bangor Bay exposed to the full sweep of the North Channel and Firth of Clyde.—C. P. K.]

After studying this and many similar passages in the book, the American reader will no longer wonder why the British have developed their narrow beams and given our flat featherweight traps the go by. The time is now at hand when we are beginning to yacht about the coast in small craft much after the fashion prevailing abroad. The work we are asking from our yachts is far more exacting than the trivial bumming about the Sound with a chance of getting out to wade ashore and hunt up a native to walk out to the trap and reef her down for you. A corresponding change in our small yachts, at least in those intended for service and not for counterfeit play, is a demand of these times, and in no way can we obtain a clearer understanding of the superior power and reliability of the small British cutter than through the pages of books in which actual life on board is so faithfully, gracefully and trenchantly portrayed as in the volume under review. As the Governor of North Carolina said to the other of South Carolina, "It is a long time between drinks." I wish there were less intervals between the appearance of the charming yachting logs hailing periodically from abroad. I thirst for their advent like a man parched in the desert for water, and there are others beside myself with the same longings. Not the least commendable feature of the book are the illustrations. Autotypes, photographed from original paintings in India ink, are scattered through the volume, contributing greatly to an elucidation of life afloat in a ten-tonner. In the latter portion, exciting events transfer the scene to the decks of a sixty-ton cruising yawl, which, being too large for Corinthian management, is given over to a regular crew, and the immediate interest in the vessel becoming proportionately less, the author helps himself out with a liberal introduction of flirting and love-making. Though written with facile sketchy pen, often humorous to a degree, and exhibiting keen insight into human nature, the chapters devoted to the Hesperus's doings scarce equal the leaves from Nereid's log. I should have preferred following Dick Porter round the coast in the ten-tonner, for the love business, nice enough in its way, is after all terribly evanescent in this world, whereas a passion for yachting, once it has a hold upon the devotee, grips firmer day by day, never letting go its hold this side of the river Styx, where Charon stands ready to pole us across in his dugout. While the first half of the book deals with fact, a suspicion is raised that the spooning on Hesperus's deck derives its interest from drawing pleasantly on fiction.

Published by Hunt & Co., 119 Church street, Edgware Road, London, England. Price probably a dollar and a half. C. P. K.

THE CONSTRUCTION OF CABIN TOPS.

IT would be hard to conceive any method of construction that would be weaker and less mechanical than that of the centerboard sloop, in which, besides the keel being further weakened materially by an opening in its weakest part, the strength that a deck affords is also destroyed by cutting off all the deck beams in the center of the vessel. These weak points, inherent to the centerboard, are usually made still worse by the construction of the cabin house, which adds nothing to the general strength, and is apt to leak on the least provocation. Any one who has watched the canvas on top of a sloop's house when under full sail, has seen the way in which the whole structure twists and wriggles, and the canvas rises and falls in swells.

In place of the ordinary construction of heavy carlins and one thickness of matched boards, a better method in many cases is similar to that employed in double skin boats. The top is composed of three layers of wood, the first, say of one-quarter inch thick, being laid diagonally across the carlins, and the second also lying diagonally over it, crossing about at right angles. The top is now painted, or better still, coated with marine glue, over which, while wet, canvas is laid and drawn tightly. The canvas is next painted on top, and a third layer of thin stuff, teak or mahogany three-eighths inch thick, is laid. The three layers are now riveted together with copper nails spaced closely together. This roof, especially if well crowned, will be very strong without the aid of carlins, and the latter may be lighter and spaced further apart than usual. In building the top several moulds may be put in to keep the shape until it is completed. The same method is also available in the construction of hatches and other parts which must be strong, light, and not liable to warp.

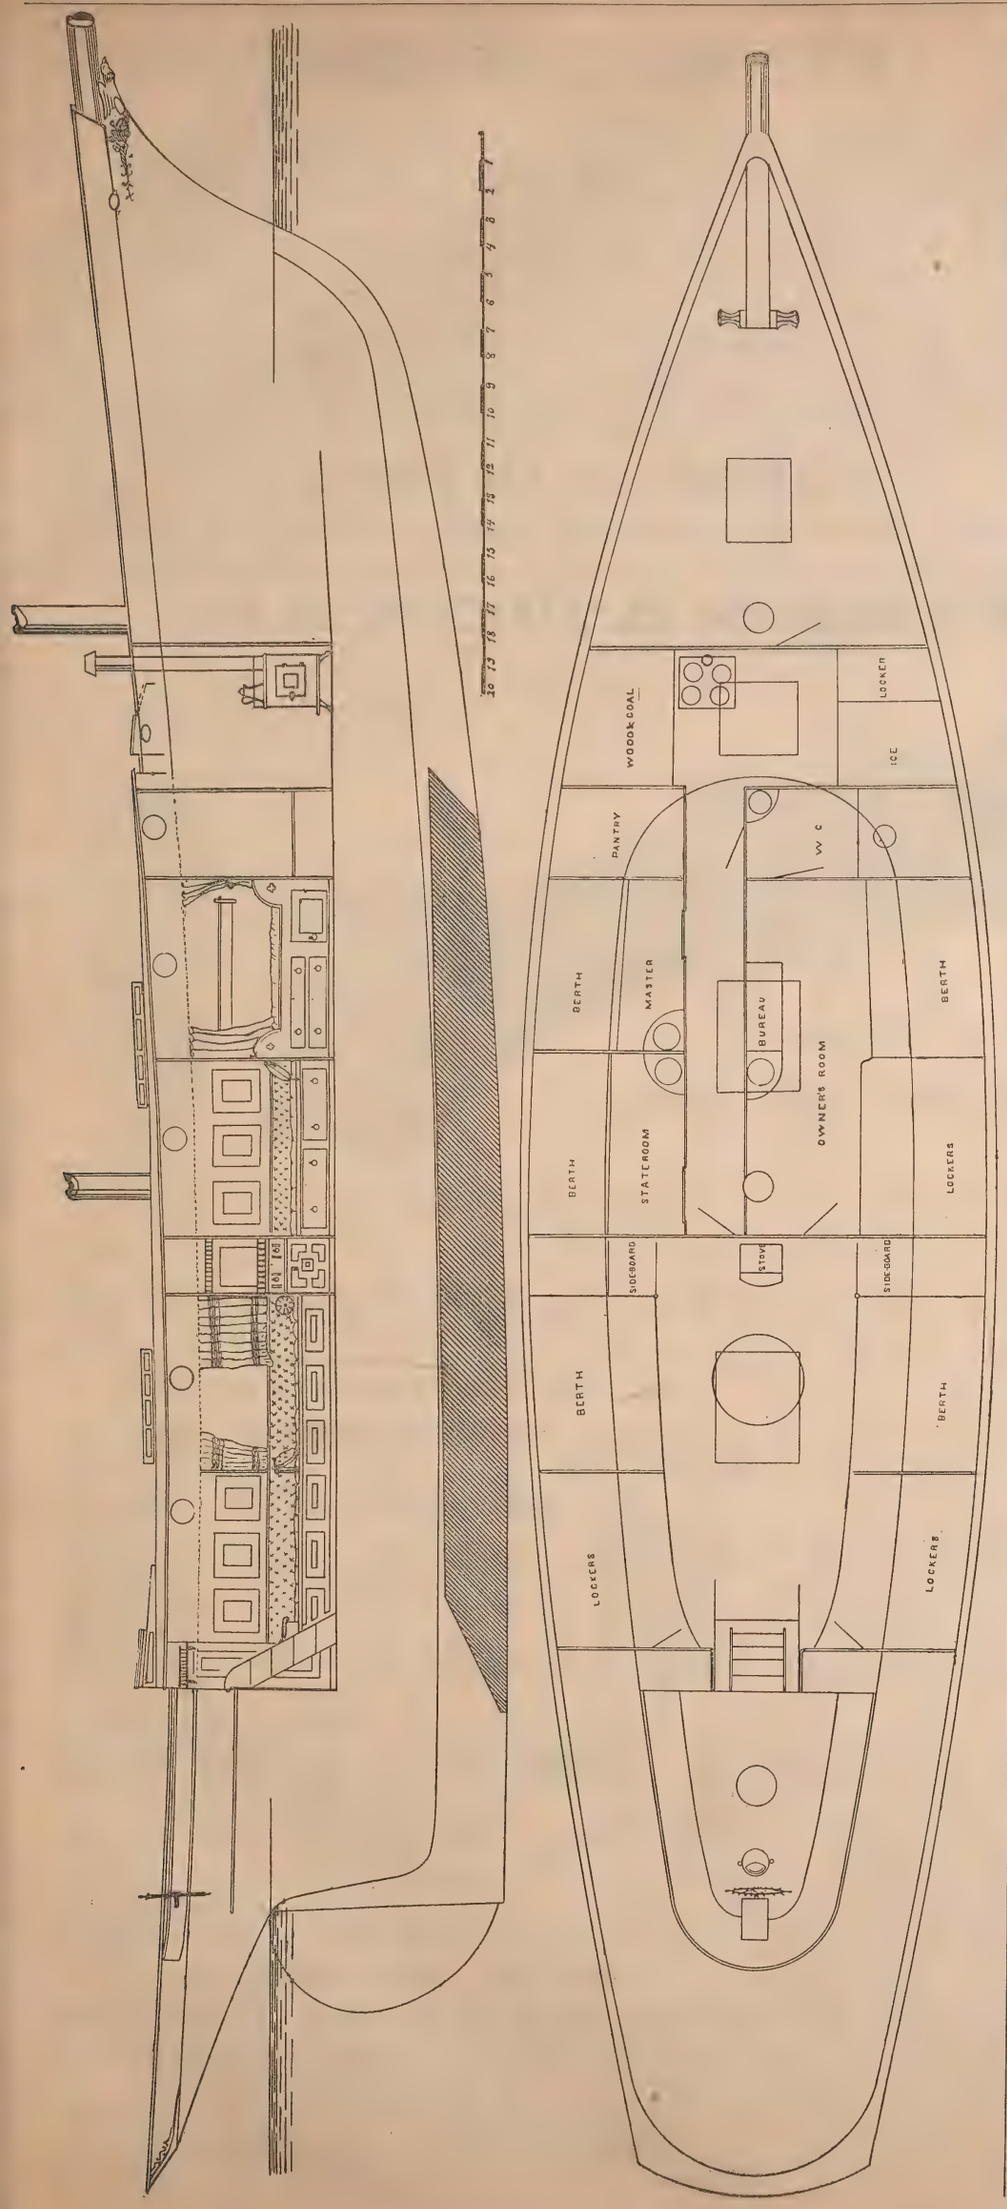
THE NEWARK Y. C.

Editor Forest and Stream:

After reading Mr. Kunhardt's remarks on "Headquarters and a Policy," I am tempted to say a word for the Newark Y. C., as in several ways we as a club would meet his approval.

This club has been in existence but a little more than two years, and during that time we have had a most satisfactory and healthy growth, not only in members, boats and finances, but in an increased interest in all that pertains to a manly pursuit of the sport. We are of a necessity restricted to the centerboard boat, owing to the shallowness of our bay and river, but while we are thus limited in our choice we try to have the best of the kind.

Our boats generally leave of a Saturday afternoon for a cruise in company and return by Monday morning. We have a commodious and comfortable club house 60x30, two stories and attic, which is divided into a meeting room, locker room and bath room on the second floor, the first floor is a spar and work room, and the attic makes a most excellent sail loft. We keep the house open the year round, and being well lighted and warmed and well supplied with books and papers, and only about fifteen minutes' walk from the center of the city, it is the favorite resort for all of our members, day and evening.



Our boats with one exception are all under 35ft., and are manned and sailed entirely by club members. We are now making preparations for our next season's work afloat. Our regular spring club regatta will take place on Decoration Day, and our second annual open regatta early in June, to which we will invite one and all, guaranteeing to all a fair race and no favors, and competitors and prizes worthy of the best efforts of all our Corinthian yachtsmen. PAS-SE-AC.

NEWARK, N. J., Feb. 10, 1885.

A BOOK ON SMALL YACHTS.

AS an answer to numerous inquiries we state that a new volume on "Small Yachts" is now in preparation. It will appear in April. Further notice will be given as to exact date of publication. This volume is intended to cover the field of small yachts, including under that term all classes of boats which can be officially sailed and supervised by their owners and friends with perhaps one paid hand for the larger vessels. Well-known examples covering the entire range of type will be illustrated in their lines, rig plans and accommodations with greater detail and finish than heretofore attempted in similar publications. The body of the work will consist of more than seventy handsome plates, 11 by 13 inches, with full description, as guides from which to select or to use as a basis for introducing modifications according to individual preference. This portion will comprise centerboard catboats, keel catboats, light displacement centerboard sloops, heavy centerboard sloops, light draft keels, deep draft keels, beamy cutters, medium cutters, narrow cutters and schooners. Also sporting boats, such as the sharpie and buckeye. All the varieties of rig will be represented. These examples are from models and designs of the best authorities in America and abroad. The cabin and deck plans, in great detail and fully shaded, will constitute an especial feature. There will also be chapters devoted to the care of such yachts and much other information having a direct interest and value to the owners of small boats. The author is Mr. C. P. Kunhardt.

THE AMERICA'S CUP.—Mr. A. Cary Smith has now in hand the plans and model of a sloop, which will be considered by the New York Y. C. at their meeting to-night, at which Commodore Bennett will be present. Proposals for estimates have been sent to the leading builders, so that if it be decided to build from the plans, work may be commenced at once. The work will be contracted for under penalties for delay, which will insure an early completion of the contract.

INTERIOR PLANS OF SCHOONER YACHT.

MR. EDWARD BURGESS, of the Eastern Yacht Agency, has lately designed a small schooner of a type well adapted for cruising on our coast, the interior plans of which we publish herewith. The leading dimensions of this boat are, length over all 72ft. 6in., waterline 60ft., beam 17ft., draft 8ft. 6in., displacement 60 tons, area of midship section 65sq. ft. The draft has been limited by the location of her home moorings, but is enough to give safety in connection with the lead keel shown and to take her to windward, while it will allow her to enter most ports without regard to tide. A cabin trunk is necessary to obtain the head room, 6ft. 3in. The main saloon, 14ft. 9in. long, is fitted with four sofas, back of which on each side is a berth with curtains. Aft of each berth is a space for lockers, and forward of each is a sideboard or bookcase. A stove is placed against the forward bulkhead, and a table below the skylight. On the starboard side of cabin is a door opening into the owner's room, 12ft. 9in. long. This is fitted up with sofas, lockers and berths similar to the main cabin, while against the center bulkhead is a bureau and washstand. The mainmast, being well forward, is out of the main cabin. On the port side is a gangway, on which open two staterooms fitted with berths and washstands for a guest and the sailing master. Forward of the latter is a galley with convenient lockers for fuel, ice and stores, with a door opening into a roomy forecastle. The w.c. is arranged just forward of the owner's room, with which it communicates, while a second door opens on the passageway. The handsome overhang gives a large roomy deck aft, while the gangways are 2ft. 9in. wide between house and bulwark. The cockpit rail incloses a portion of the deck, making a convenient seat, and keeping out all water, while from the cockpit is an easy entrance into cabin. A hatch in the cockpit floor gives access to the sail locker. In this class of yacht the cost both of construction and maintenance is moderate, a small crew is required, while the accommodations, which may be varied somewhat according to the desire of the owner, are ample for a small party. On such a boat the summer could be spent in a pleasant and healthful manner and with no lack of amusement at a tithe of the cost of a sojourn at any fashionable watering place.

SOUTHERN YACHTING WATERS.—Painesville, Ohio.—*Editor Forest and Stream:* I have just returned from a three months' cruise of southwest coast of Florida, including an extended tour up the Myaka and Caloosahatchie rivers, and desire to say through the medium of your paper that should any of my brother yachtsmen and lovers of gun and rod wish to get any pointers of nature of game and country, I would be happy to hear from them at above address. In return will you inform me what kind of a yachting country the coast of North Carolina is along in Currituck and Pamlico Sounds in winter and fall months, as it is then I have to do my yachting. Would it be too cold to cruise all winter, and what game does one find there? Kindly inform me, if possible, about this coast, and if not, please ask some of our friends to post me. If I have suitable reports of this locality I shall have a little cruiser built this coming summer for the purpose, probably in New York. Having seen a good deal of Florida this past winter I am led to ask you to publish this in the hope that I can be of some assistance to some one.—GEO. E. ANDREWS. [The waters of Currituck and Pamlico Sounds are quite shoal and not well fitted for cruising. Weather is usually mild with occasional cold snaps which freeze the Sounds over. Game consists of ducks, geese and swans on the water, deer, snipe and quail on the land. The shores are largely owned by private parties who do not allow gunning. Non-residents are forbidden by law to shoot on the water.]

BUFFALO Y. C.—*Editor Forest and Stream:* The Buffalo Y. C. held its annual election of officers Wednesday, February 18, resulting as follows: Commodore, Harry N. Vedder; Vice-Commodore, L. G. Northrop; Secretary, E. P. Field; Treasurer, Fred S. Bennett; Measurer, M. C. Provoost; House Committee, H. N. Vedder, chairman; H. D. Williams and William Watts; Regatta Committee, Henry B. Doyle, chairman; John F. Ellsworth, C. Lee Abell; 15 new members were admitted. This club will have to do some sharp work, as its younger competitor, the Buffalo City Y. C. has some of the best yachts now sailing in Buffalo waters, and, being a strong offshoot of the original B. Y. C., will make it very warm for them. However, this pleasant rivalry will give yachting just what we've long looked for here, and that is a thorough waking up. Lake Erie is frozen over as far as the eye can reach, and you can see about 12 miles up the lake, and present indications are not very encouraging for an early season. I trust in my next to give you the name of all yachts in both clubs, and, from what I can find out, there are going to be several new boats in each club, and all deep drafts. No more flopovers, but good safe yachts.—PENNANT.

QUAKER CITY Y. C.—Camden, N. J., Feb. 16.—*Editor Forest and Stream:* With the club incorporated, a site for a club house purchased, a more equitable rule of measurement adopted, a board of examiners for captaincies appointed, papers catering to manly sports found in the club room and other progressive measures adopted, the Quaker City Y. C. will enter on a new era. Several new cabin yachts have been enrolled in the club, and others now building will follow suit. A new cutter will make her debut in the third class at the annual regatta. The Sunbeam, centerboard sloop, first class, is undergoing alterations and will have iron on keel. The Nahma, third class, will be lengthened aft with a long fantail, and other yachts of the fleet are being improved. The secretary has sent you a list of officers for the ensuing year, they are men of ability, and the club is a unit.—C. R.

A LIGHT DRAFT SLOOP.—Mr. A. Cary Smith has just completed the design for a sloop for use in Florida waters. She will be 44ft. over all, 40ft. waterline, 14ft. beam, and will draw but 2ft. She is sloop rigged, the mast being stepped well aft. The cabin house is necessarily quite high to gain headroom in so shoal a boat. The top of the house will be made of three thicknesses of thin wood, crossing each other and tightly riveted together, a layer of canvas being laid between two of the layers of wood, making a very stiff top. The boat will be built in Florida.

READY IN SEASON.—Mr. Winslow's new schooner will be completely finished and canvas bent before launching, and when she leaves the ways she will need only extra ballast before hoisting sails for her trial trip.

A NEW STEERING GEAR.—Laughlin & Son, of Portland, Me., have lately put on the market a strong and simple steerer, which they offer at a low price. The wheel is geared so as to work the reverse of a tiller.

HAMILTON, ONT.—Molly will enter some of the races on Lake Ontario next season. A new 10-tonner is being built for Mr. Jarvis, a deep cutter, and another ten, with a centerboard, for Mr. Webster.

BOSTON.—Messrs. Burgess Bros. are now finishing the two *Herald* launches built for them by Lawleys. They have just completed a design for a deep centerboard catboat.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

F. R. H.—Write to the Ligowsky Company.

N. E. W.—There is no bend in the bore of a gun.

E. H., Chicago.—For receipt for whitening sails see the FOREST AND STREAM for Sept. 13, 1883.

R. C. R., Westfield, Mass.—Write to J. L. Smith, P. O. Box 104, Hackettstown, New Jersey.

C. C., City.—Go to the Adirondacks. You will find no game in June, that is a close month.

E. N., Kingston, Ontario.—See yachting columns for announcement of the forthcoming book on Small Yachts.

W. T. B., Brooklyn, N. Y.—Your question can only be intelligently answered after an inspection of the arm. Take it to a gunsmith.

THE COOK.—It is not unusual to see the white ptarmigan in the New York markets. A few barrels of them are received nearly every winter.

L. B., Brooklyn, N. Y., wants to know of location for camping in Adirondacks on lake accessible from North Creek, where guide is not necessary.

CONSTANT READER, N. Y.—There is no book exclusively devoted to building canvas boats. The subject is treated in "Canoe and Boat Building," for sale at this office. For dimensions of canoes see "Canoe and Boat Building."

S. A. C., New Haven, Conn.—Can you tell me where I can dispose of some stuffed owls and ducks, having more than I care for? Ans. Write to J. Wallace, 16 North William street, or Fred Sauter, William street, New York. Almost all taxidermists will buy owls.

C. G. M., Andover, Mass.—The lead shoe will cost about four cents per pound for lead and one and a half cents for casting. A wooden pattern will be needed, costing about $3 to $6. Any iron foundry possessing a large iron pot can cast it. Cruiser was built by E. A. Willis, of Port Washington, Long Island. She is probably at Larchmont at present.

C. B. W., East Haddam, Conn.—The Mamie is much narrower and deeper than the ordinary skipjack, and has not the bilge of the latter. She bears the same relation to a keel sloop or cutter that the skipjack does to the shoal centerboard boat. The loose-footed mainsail can be stretched or slacked off according to the state of the weather, the tack can be triced up, reducing the area quickly and easily, and the gaff is held in closer to the line of the keel.

FISHING RODS.

Having been the pioneers in the manufacture and introduction of Section Bamboo Rods, we have always taken great pride in securing and perfecting every improvement in order to maintain our position as the makers of the very best rods. Knowing not only theoretically, but also by long experience, that a properly made round rod is the only absolutely perfect rod, we have invariably refused, and still do refuse, to put our name on any but our "Best" round section rods. Our prices for these round rods average only about 40 per cent. more than the prices asked by any other makers, while the rods are widely known to be *incomparably superior.* While no hexagonal or any angular) rod can be perfect, we long believed that with proper workmanship and material a *really good* angular rod could be made. Being much easier and cheaper to make than round rods, we hoped to be able to offer to those anglers who can not afford to pay the price of our "Best" round rods, a hexagonal rod that would be good and serviceable at a moderate price. We are more than satisfied with the success which has attended our efforts, for we are now able to furnish a hexagonal rod that is really worth having, and at a price which is only a trifle in advance of that asked by other makers.

In addition to the many styles of round and hexagonal Section Bamboo Rods, we wish to call the attention of anglers to our large variety of fine Ash and Lancewood and Greenheart rods. *Every rod guaranteed absolutely hand made.*

If your dealer does not keep our goods in stock, or will not order them for you, send us 50 cents for 120-page illustrated catalogue.

THE

This important work, now for the first time offered to the public, contains full life histories of all the quadrupeds of this State. These biographies are as different as possible from those too often found in scientific works; instead of being dry and dull

MAMMALS

they breathe the very fragrance of the woods and fields, and give us a close insight into the every-day life of their shy inhabitants. To the lover of nature the work commends itself by its title. The hunter will need it for the complete account it gives of the habits of the deer, the hares and the

OF

squirrels. The farmer should read it because it tells him all about his enemies, the shrews and field mice who devour his crops, and about their enemies whom he would like to protect.

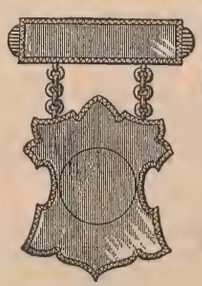
NEW YORK.

This interesting work is published in two volumes, the first taking the reader from the *Carnivora* (flesheaters) to the *Cervidæ* (deer), and the second concluding the subject.

BY

C. H. MERRIAM, M.D.

The volumes are superbly gotten up and are printed in large, clear type on heavy tinted paper.



We offer a few copies for sale at the following prices: Single volumes, paper, $2 each. The two volumes, paper, $3.50. The two volumes, cloth, $5.

Explanatory and Suggestive.

FOR THE CASUAL READER.

Arma virumque cano—"Arms and the man I sing." And, indeed, it would take the genius of a Virgil and the roll of Latin hexameters fitly to tell the deeds of this man, whose arms are shotgun and fishing rod. Go where you will, he is there. You run into him on the crowded city street, encounter him on cars and steamboats; he perches atop the country stage, bestrides the burro, and doubles up like a jacknife in the kanim. Seek out the most distant, most tortuous streams, his line has been wet in their waters; penetrate into the wilderness, the tin can of the sportsman's camp is yet further on. He goes for game—if the fates shall send anything within reach of his ammunition; for fish—if by good fortune a trout shall rise to his fly or descend to his worm. But, good luck or bad luck, game or no game, fish or no fish—fun always, fresh air, ozone, quicker pulse beat, brighter eye, more elastic step, all the multitudinous rewards, which, after all, outweigh the biggest "bags," and tip up the longest "strings." Is it not true that only a poet could tell his deeds as they ought to be told? Perhaps so. Perhaps not. He can usually tell them himself. And he does, with a thousand different pens, in a thousand different ways.

You may read it in the FOREST AND STREAM.

And that is better than if it were put into verse between book covers.

One who does not understand these things might imagine that after being told so often, this story of the man—him with the rod and gun—might in the end become hackneyed. But it is not so. Why? Well for pretty much the same reason, we venture to say, that the fields themselves and the woods and the lakes and the streams never become hackneyed. However that may be, one thing is certain. Our columns every week, and month after month, give ample proof that there is still an abundance to tell of what is seen and what is done afield and on angling waters; and that hosts of people still delight to read the telling, our subscription books show with ever increasing emphasis. The FOREST AND STREAM is in the best sense

A Journal of Recreation.

It tells of the recreation found by busy men, in out-door, open-air life. It *is* recreation to these same men and to others. Explain it how you will, this recreation found in the pages of the FOREST AND STREAM is different from the diversion afforded by other papers. Why? Because (it may be answered again) the recreations of field and stream are always ten times more potent for good than are those found in almost any other way.

Look through the pages and you will see that the departments include a pretty large field. It is a wide scope of subjects. But if you look carefully you will see that the paper, from front cover to back cover is homogeneous. What is in it belongs in it. There is not the mistake of trying to foist upon the reader, who is interested in angling and shooting, a lot of stuff about horse racing or base ball or prize fights. There is no sawdust-ring odor. Everything is redolent of the woods. There are plenty of other papers devoted to the other subjects. If you are interested in them, you need hardly spend time to read the rest of this explanatory advertisement. The FOREST AND STREAM'S field is broad, but it is not broad enough to take in all creation. The editors are perfectly contented with the scope of the paper as it is at present. And now

A Word About 1885.

For fifty-two weeks of the year 1885 we propose to publish the FOREST AND STREAM, and to fill each number with the same rich abundance and variety of reading that may be found in this present number or in any one of the five hundred numbers that have gone before it.

There will be the same delightful accounts of the adventures and misadventures of the *Sportsman Tourist*, and whether the "tour" be across a continent or only across the pasture lot into the woods beyond, the story in either case will be well worth the time it takes to read it. We shall have, now and then, a description of such excursions in foreign lands, but for the most part these columns will deal with what is seen and done in our own country, for that, after all, is what the readers of FOREST AND STREAM are rightly presumed to be most interested in.

The *Natural History* columns will give attention to varied forms of animal life, more particularly such as may come under the observation of sportsmen in their rambles. This department of the FOREST AND STREAM we believe to hold a place altogether unique. It is neither the dime-museum sort of un-natural history affected by the newspapers, nor the abstruse, fine-spun and terribly dry lucubrations of the scientific associations. It is intelligent talk about animal life, intended for intelligent readers.

In the *Shooting* and *Angling* columns (we need hardly say it) will be accounts of hunting excursions and fishing trips—with luck, good, bad and indifferent; discussions about matters mechanical, ethical, sentimental, fanciful and practical; some, after much debating, will be settled; others will be left (and the reader with them) at the end just where they were at the beginning.

The *Kennel* will give in 1885 (as it has given in 1884) the earliest, most accurate and the only unbiased reports of shows and trials, and it will be the endeavor of the editors to maintain for the FOREST AND STREAM in this special branch the position it now holds away in advance of anything else published in this country.

The *Yachting* columns are in charge of an expert, whose highest ambition will be to keep these departments in the place already won for them in the recognized lead of journalism. Though the *Canoeing* interest of the country is of comparatively recent growth, the FOREST AND STREAM fully appreciating its importance, has provided for those who sail or paddle a (pretty generous) corner, which is so full of practical suggestions and recountings of cruising experiences, that a canoeist might almost as well try to get along without a paddle as without the paper in his mail every week.

In a word—this is what we started out to say—in 1885 the FOREST AND STREAM will be newsy, bright, wholesome—a journal of out-door recreation.

New Publication.

CANOE

THE FOREST AND STREAM began a year ago the publication of a series of papers on canoe construction, by Mr. W. P. Stephens, of the New York C. C., widely known as an expert on canoe design and building. These papers, having appeared through the year in our columns, have since been rewritten, and with numerous additions are now published in a handsome volume under the title of "Canoe and Boat Building for Amateurs." Mr. Stephens is peculiarly fitted for the preparation of such a work, beginning as an amateur, and having after a long experience of the difficulties attending a learner, taken a prominent place among canoe builders, due both to the model and workmanship of his canoes. Realizing fully the difficulty of explaining to a novice an art in itself far from easy,

AND

and with which he is entirely unfamiliar, the book begins with a description of the various classes of canoes in general use, with their main features and dimensions, and definitions of the terms used in connection with them. Numerous examples of canoes are given, and in connection with them, such plain instructions in designing as will enable the beginner to select intelligently the proper craft for his pur-

BOAT

pose, and to plan her dimensions, details and fittings. To this end designs of all classes of canoes are given, with full dimensions and details. The object has been not merely to enable the tyro to build one boat as described, but to teach him the principles of designing and building in such a way that he may construct such a craft as he desires. Following the chapters on designing, the construction of a canoe is taken up in detail, the tools and appliances being first clearly described, as well as the various materials, after which follows the actual work of building. Every operation is taken up in order, from the selection of the keel to the varnishing of the finished boat, and illustrated with numerous diagrams.

A chapter on sails describes all the varieties in use by canoeists, down to the new Mohican settee, with directions for making, rigging and measuring them, while the method of proportioning the sails to the boat is clearly explained, all the calculations

BUILDING

being worked out in detail. The many minor points of a canoe, paddles, steering gears, rudders, aprons, and camp outfit are also described at length, while a chapter is devoted to canvas canoes.

The subject of boat building is fully treated, a rowboat of the usual construction being taken as an example, and described in all its parts in such a manner as to make clear the principles involved, and their application to any form of boat, either lapstreak or carvel build. Each of the numerous technical terms belonging to the subject is defined clearly when it first occurs, and as the index is full and complete, the book is in itself a glossary.

In addition to the numerous diagrams in the body of the work, twenty-four large plates are printed on bond paper, containing the working drawings of canoes for paddling, sailing, cruising

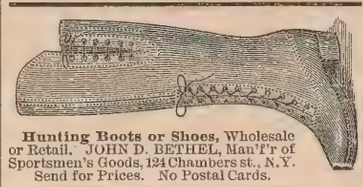
FOR

and racing, with their sail plans, rowing sailing boats, large canoe yawls, and various boats for special purposes, such as gunning boats, yacht boats, and the widely known sneakbox.

The canoe yawl, a boat between a canoe and a yacht, is illustrated by examples of various craft from 17 to 20ft. long, and suitable for a crew of two or three on a cruise. This class of boat, while little known among us as yet, is admirably fitted for cruising, and will meet the wants of many who object to a canoe as being too small, and yet desire a boat with the same excellent qualities. The boats and canoes illustrated are in all cases among the best of their class, the list of canoes including English, Scotch and American craft, and are all drawn

AMATEURS.

to scale, so as to be available as working drawings. The plates, for convenience in using, are placed loose in a tough manilla envelope and accompany the book.



Pp. 168, with 24 plates of working drawings. Price $1.50. Address,

Stud Fee, $25.00.

STUD FOX-TERRIER

Champion Raby Tyrant,

(K.C.S.B. 11,179.)

Pupped October, 1880. Weight 16½ pounds.

Raby Tyrant is a white dog, with an even marked rich black and tan head. He is a thoroughly game and stylish terrier, possessing a beautifully shaped long punishing head, with perfect drop ears, small eye, rare neck and shoulders, deep chest, well ribbed and muscular quarters, short, straight legs, excellent feet, great bone and substance, with an exceptionally hard and dense coat.

Raby Tyrant is without doubt one of the most successful terriers of the present day. He has been exhibited 67 times, 33 different judges having adjudicated upon him, and has won 47. First 10 cups and specials; 12 second and 2 third prizes. His breeding is undeniable, combining as he does the choicest and most valuable blood that can be obtained. At the stud Raby Tyrant is proving himself eminently successful.

Fee, $15.00.

ANSWERS TO CORRESPONDENTS.
PUBLISHERS' DEPARTMENT.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, yachting, canoeing, and kindred subjects, than is contained in all other American publications put together.

LET THE BEST BE CHAMPION.

DOG show managers are just now in a tremendous muddle about champions. This condition of affairs is all the more ridiculous because the nature of a championship is something about which there can properly be no sort of dispute. In all other branches of competition where championships are awarded, the term is perfectly well understood to signify that the individual bearing it is an acknowledged superior over all others. Thus, a champion oarsman is one who excels all others in rowing, and a champion runner is one who excels all others in running. Common sense and common usage agree that there can be but one such individual superior to all others, that is, but one champion. Common sense also declares that when dogs are awarded merit according to their relative excellence, there can be but one among them whose excellence exceeds that of every competitor, that is to say, there can be but one champion. But by absurd usage in kennel affairs it is the custom of giving the title of champion to some dozen or more dogs, and thus to declare that each one is the superior over all other dogs, and over each one of the eleven of the twelve. As a natural result, the title of champion, when applied to dogs, does not have a meaning similar to the title champion when applied to oarsmen or runners, it signifies, if anything, that one champion dog is a pretty good sort of a dog, as good, at least, as other champion dogs. Little credit attaches to the title, and that little is growing thinner and thinner as it is spread out to cover new accessions to the ranks.

This has gone as far as it ought to go. The time has come for a change. It must be a radical change. Champion means nothing. The first thing is to give it a meaning. It should mean when applied to a dog just what it means when used elsewhere. It should mean the best, the superior over all others. The title should be given only to the best. Select the best dog of a given class, and declare him the champion. Let him remain champion until some better dog is found. Then give the title to the new comer. That is all there is to it. There is no opportunity of muddle about it.

The rule requiring a dog to have won three firsts in open classes before competing in a champion class is excellent. After winning these three firsts, he should be debarred from the open classes, but not allowed to assume the title of champion until he has actually won it by a demonstration of his superiority. Having won the title, he should be allowed to keep it as long as he can maintain it, but no longer.

Two or more of the important shows each year should be designated at which the champion should be compelled to appear to contest the claim against all comers entitled to compete. Failure to appear should be equivalent to defeat, and the title of champion would then be forfeited by him and awarded to the best dog shown. It is sincerely to be hoped that the American Kennel Club at its next meeting will consider this matter and unanimously adopt a rule embodying these provisions.

THE ADIRONDACK DEER LAW.

THE bill introduced into the Assembly by Gen. N. M. Curtis came up on a third reading last Monday and was passed by a vote of 66 to 15. It has gone to the Senate where Mr. Fassett has charge of it; and there is every reason to hope that it will be passed and sent to the Governor.

The bill forbids the hounding of deer in this State at any season, and the single locality excepted is Suffolk county. Of course this exception is a singularly foolish one. The deer on Long Island are very few; there would be none there at all but for the long term of protection, which expired last season. It will be only a very short time before they will all be gone. But the Long Islanders are inordinately bent on having full license to make the most of the deer while they do last, and since the Suffolk county member presumably represented the wishes of his constituents, Gen. Curtis did very wisely in yielding. It would not have been worth while to hazard the progress of the bill by any other course. The Adirondack deer are more important than those of Long Island. Now that so much has already been done, every influence should be exerted to induce the Senate to favor the measure.

Deer hounding in the Adirondacks must be stopped, and stopped before another summer.

A FLOWER SHOW.—An exhibition of flowers will be held at 247 Fifth avenue, March 9, 10 and 11, which will, no doubt, surpass in beauty anything of the kind yet seen in America. The proceeds will go to the German Hospital and the Orthopædic Hospital, and the show is to be held under the auspices of Mrs. George Bliss, Mrs. William Astor, Mrs. W. K. Vanderbilt and other ladies. Mr. C. F. Klunder will manage it, and those who remember the beauty of the similar exhibition which he gave a year or two ago will anticipate great pleasure from the one which is to come. The object of the show is to tell what is now being done in growing flowers in this city, as well as to point out some of the possibilities of flower culture. Preparations for the show have been going on for some time, and a great number of rare and beautiful plants have been got together. The orchids, it is promised, will make an unusually fine show, as will also the azaleas and hyacinths. We may feel sure, from Mr. Klunder's previous success, that the exhibition will be remarkable for its beauty and good taste.

ON THE BORDER.—A correspondent recently called a tention to the great destruction of game by the French Canadians employed in Maine lumber camps, and by others who crossed over from Canada on purpose to hunt. The truth of the statements of this writer were subsequently called into question by other correspondents; but there appears to be no good reason for supposing the case to be other than as stated by him. The facts probably are that we shall never know how extensive the game killing by these French Canadians actually is. Their pot-hunting grounds are usually remote from the settlements, and the men who could tell us about the ways of the Canucks refuse to do so because they do not wish to incur their enmity; at least, such is the excuse given to us by well-informed men whom we have asked to write about this subject.

BIRD LIME is the sort of ammunition most in favor with the New Jersey fellows who go in for a wholesale song bird slaughter. New Jersey needs a stringent law to cut off this bird destruction.

THE DIMINUTION OF TROUT STREAMS.—No person, among whose memories of a quarter of a century ago is that of the trout streams in which his lines were cast, and who re-visits to-day those waters, can fail to note the shrinking of the stream, the narrowing of its flow, and the gradual drawing closer together of the two banks; nor it is without a certain sentiment of regret that one thus sees the dashing, white foaming trout brooks giving place to shallow streams, deserted by the fish, and having no charms for the angler; and often with this regret come impatient exclamations against the so-called necessities of civilization which have wrought the change, or if the angler be in philosophic mood, regret gives way to speculation as to the natural agencies in league with man to accomplish the drying up of the streams; such a speculation is printed in our angling columns to-day, its author calling attention to a factor not hitherto fully recognized.
